the refugees, ultimately preventing the spread of a highly contagious disease. This approach exemplifies how transcultural nursing can play a vital role in providing culturally sensitive and inclusive health care to diverse communities.

1. How should the nurse approach addressing and overcoming vaccine hesitancy among refugees, considering their cultural beliefs and experiences?
 2. Describe how the nurse should assess the effectiveness and impact of the culturally sensitive vaccination program for refugees.
-

Chapter Summary

22.1 What Is Transcultural Nursing?

Transcultural nursing involves providing client-centered care that is culturally competent and sensitive to individuals from diverse cultural backgrounds. The practice of transcultural nursing is based on understanding culture's influence on health care decisions, illness, and health. Transcultural nursing aims to promote culturally inclusive health care, enhance client engagement, and reduce health care disparities by incorporating the cultural beliefs, values, and practices of clients into the plan of care.

22.2 Cultural Models

Cultural models are frameworks or patterns of thinking and behavior shared among members of a particular cultural group. These models influence how individuals perceive and interpret the world, including their views on health, wellness, and health care. Nurses can use these models to effectively communicate, establish

Key Terms

cultural awareness having an understanding of and sensitivity to the values, beliefs, and customs of different cultures

cultural bridging the act of building connections between individuals or groups from different cultures to promote understanding and collaboration

cultural care accommodation the process of adjusting nursing care to meet the specific cultural needs and preferences of the client

cultural care negotiation the process of finding a mutually acceptable way to provide nursing care that is congruent with the client's cultural beliefs and practices

cultural competemility the synergistic relationship between cultural competence and cultural humility

cultural desire a nurse's motivation to become culturally competent

cultural encounters a nurse's direct engagement with clients from different cultures

cultural essentialism the belief that there are inherent, unchanging qualities that define a particular culture

cultural imposition the act of imposing one's own cultural values and beliefs onto others, without regard for their own cultural background

cultural knowledge an understanding of the beliefs, values, and practices of different cultures

cultural nursing assessment the process of assessing a client's cultural background and its

trust, and tailor interventions that align with clients' cultural beliefs and values, ultimately improving client outcomes and satisfaction.

22.3 Cultural Assessment

Cultural assessment in nursing is the systematic process of gathering information about clients' cultural beliefs, values, norms, and practices to better understand their health care needs. It involves exploring the client's cultural background, language preferences, religious or spiritual beliefs, family dynamics, and health care practices to provide culturally competent care. Through cultural assessment, nurses can identify any cultural barriers or influences that may impact client care and develop individualized care plans that respect and accommodate the client's cultural context, promoting better health outcomes and client satisfaction.

potential impact on their health and health care needs

cultural skill a nurse's ability to adapt their skills to meet the needs of clients from different cultures

culturally sensitive care health care that respects and incorporates clients' cultural beliefs, practices, and values

culturally sensitive environment a health care environment that is designed to be welcoming and respectful of diverse cultural backgrounds

culture shock the disorientation and discomfort that can result from being in an unfamiliar cultural environment

empathy the ability to understand and share the feelings, perspectives, and experiences of others

ethnocentrism the belief that one's own cultural group is superior to others

intercultural interactions interactions between individuals from different cultural backgrounds

transcultural nursing a framework that seeks to provide culturally sensitive and competent care to individuals from diverse cultural backgrounds, recognizing that culture significantly shapes an individual's health beliefs, behaviors, and practices and emphasizing the importance of understanding and respecting cultural differences in health care delivery

transcultural nursing models models of nursing care that are designed to be effective across different cultural backgrounds and settings

Review Questions

1. A nurse is caring for a client from a different cultural background who refuses a certain medication. How can understanding transcultural models and frameworks help the nurse in this situation?
 - a. By disregarding the client's cultural beliefs and administering the medication
 - b. By respecting the client's cultural beliefs and finding an alternative medication
 - c. By consulting with the health care team to override the client's choice
 - d. By educating the client about the importance of the medication and convincing them to take it
2. A nurse is caring for a client from a different cultural background who is experiencing chronic pain. The nurse asks the client, "Mr. Smith, I would like to understand how you generally manage pain or if you have any preferences for pain management. Could you please share with me any cultural practices or approaches that you or your family find helpful in managing pain?" The nurse's approach is most closely aligned with which of the following models?
 - a. Giger and Davidhizar transcultural assessment model
 - b. Leininger's culture care diversity and universality theory
 - c. Purnell model for cultural competence
 - d. Peplau's interpersonal relations theory
3. A nurse is providing care to an older adult client who follows a traditional cultural practice of using herbal remedies alongside prescribed medications. How can the nurse incorporate the client's cultural practice of using herbal remedies into the plan of care while ensuring the client's safety and well-being?
 - a. Educate the client about the risks of using herbal remedies and encourage discontinuation.
 - b. Advise the client to consult with a traditional herbalist for proper guidance.
 - c. Collaborate with the client and health care team to assess safety and potential interactions.
 - d. Disregard the client's cultural practice to prioritize evidence-based care.
4. A 35-year-old client has recently been diagnosed with high blood pressure. He is concerned about taking medications for the rest of his life and is interested in alternative therapies. He expresses an interest in using traditional healing practices and asks you what other options exist apart from medications. To integrate culturally responsive care while caring for this client, the nurse would need to:
 - a. Dismiss the client's concerns and explain the importance of taking medications to control his blood pressure.
 - b. Provide the client with a list of alternative healing modalities without exploring his cultural beliefs.
 - c. Collaborate with the client to identify traditional healing practices that are safe and effective to use with his prescribed medications.
 - d. Encourage the client to try the medications and explain that they are the only effective way to control his blood pressure.
5. A client who is pregnant and from a Middle Eastern background expresses discomfort with receiving prenatal care from health care providers who are men. To provide culturally responsive care for the client, the nurse should:
 - a. Explain the importance of receiving care from health care providers who are men regardless of cultural preferences.
 - b. Schedule all prenatal appointments with health care providers who are women to accommodate the client's cultural preferences.
 - c. Disregard the client's concerns and continue to assign health care providers who are men for the client's prenatal care.
 - d. Discuss the client's concerns and work collaboratively with the client to find a solution that respects their cultural preferences.
6. A newly admitted client from a Hispanic background is hesitant to communicate her symptoms and concerns to the health care team. Which of the following best describes the nurse's aim of conducting a cultural assessment for this client?

- a. To identify potential language barriers and provide appropriate interpretation services
 - b. To promote cultural sensitivity and understanding of the client's needs in the health care setting
 - c. To acknowledge the client's hesitations and insist that she communicate openly about her symptoms
 - d. To ensure that culturally appropriate interventions are included in her care plan
7. A nurse is providing care to a client from a different cultural background and notices that the client seems reluctant to ask questions or express concerns. Which of the following strategies should the nurse implement to ensure culturally sensitive care?
- a. Provide translation services for effective communication.
 - b. Use plain language and visual aids to enhance understanding.
 - c. Create a safe and open environment for the client to ask questions.
 - d. Involve the client's family or community in health care decisions.
8. A nurse caring for an older client learns that the client finds peace and comfort in a personal spiritual practice and aims to incorporate this into the plan of care. How can incorporating traditions and personal views in the plan of care demonstrate empathy to the individual's life experience?
- a. It shows the nurse is willing to compromise their own beliefs to provide care.
 - b. It allows the nurse to ignore the client's cultural practices.
 - c. It demonstrates respect for the client's cultural practices and personal beliefs.
 - d. It decreases health care costs.
9. A client from an Asian background prefers a holistic approach to health care and believes that physical and mental health are interconnected. According to the Giger and Davidhizar model, which component of the model should the nurse consider when providing care for the client?
- a. Biological variation
 - b. Social organization
 - c. Communication
 - d. Time
10. A client with a visual impairment requires information about his medication regimen in accessible formats such as braille or audio recordings. According to the Campinha-Bacote model, which component of the model should the nurse consider when providing information about the medication regimen to the client?
- a. Cultural competence
 - b. Cultural awareness
 - c. Cultural skill
 - d. Cultural desire

CHAPTER 23

Culturally and Linguistically Responsive Nursing Care

FIGURE 23.1 Culturally responsive nurses recognize and respect cultural differences to better understand and respond to their clients' needs. (credit: modification of work by Russell Watkins/Department for International Development/Flickr, CC BY 2.0)

CHAPTER OUTLINE

- 23.1 Culture, Cultural Identity, and Cultural Humility
- 23.2 What Is Culturally Responsive Care?
- 23.3 Factors Affecting Culturally Responsive Care
- 23.4 Becoming a Culturally Responsive Nurse
- 23.5 Linguistically Responsive Care
- 23.6 Providing Culturally and Linguistically Responsive Care

INTRODUCTION Cory, a community health nurse working at the county clinic, introduces himself to a new client, Mrs. Rodriguez. Focused on providing individualized care, Cory begins by asking about her health practices and preferences. Mrs. Rodriguez shares that she recently moved to the United States to be closer to her family and prefers to involve them in her health care decision-making and planning. When asked if she would like to include a family member in the visit, Mrs. Rodriguez accepts the offer, explaining that her daughter, Selma, is in the waiting room. After welcoming Selma into the room, Cory notes that Mrs. Rodriguez is visibly more comfortable discussing her health. As he empathetically listens to her concerns, Cory prioritizes his client's cultural beliefs and preferences. At the end of the visit, Cory provides culturally adapted materials to facilitate Mrs. Rodriguez's plan of care.

Cory's experience as a community health nurse is like that of many other nurses working in health care today. As our society and world become more globalized, nurses need to adapt to a rapidly changing landscape of cultures, information, and ideas. This chapter provides the knowledge and tools to understand and begin assessing the role of

culture in nursing and client care.

23.1 Culture, Cultural Identity, and Cultural Humility

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 23.1.1 Examine the meaning of culture in the nursing context.
- 23.1.2 Explain cultural identity.
- 23.1.3 Discuss the importance of culture and cultural identity to achieving the goals of population health.
- 23.1.4 Discuss the concept of cultural humility and its significance to nursing.
- 23.1.5 Explain how cultural humility and cultural awareness affect nursing care.

One effect of rapid globalization is that the U.S. population is always changing. Based on 2021 U.S. Census data, more than one in five adults living in the United States speak a language other than English at home (U.S. Census Bureau, n.d.). Each new generation is increasingly diverse, comprising individuals who identify with a multitude of ethnicities, races, religions, genders, and sexual orientations. This diversity has increased faster than our society's ability to navigate the many cultural factors underlying these rapid changes.

Culture

Culture is learned in a dynamic process passed from generation to generation, shaping a person's beliefs, influencing their behaviors, and playing a large role in shaping their identities (Giger & Davidhizar, 2002). Individuals within a cultural group share common values, beliefs, and norms that influence their responses to the world around them. Amish communities in Pennsylvania and transgender youth are examples of cultural groups. Everyone, regardless of where they are born or live, belongs to one or more cultures.

Although cultures consist of many people, every individual behaves differently depending on their own circumstances and experiences. This makes it impossible to pick one person from a cultural group as a "typical" example of that group. On a smaller scale, think of how different two siblings in the same family can be.

Cultural Identity

Cultural identity is the unique combination of beliefs, values, attitudes, behaviors, customs, practices, and language that make up an individual's sense of belonging to a particular cultural group. Like culture, cultural identity is fluid and can change throughout a person's lifetime. How? Cultural identity can be influenced by factors such as migration, globalization, social forces, interpersonal relationships, and individual experiences. Each person's cultural identity is an important aspect of their self-concept, encompassing who they are, how they fit into society, and what their larger context is within the human experience. All nurses bring their unique cultural identities to every client encounter, and all clients do the same.

Let's return to Cory's work with Mrs. Rodriguez. Mrs. Rodriguez moved to another country, the United States, to involve her family in her health care, something she considers vitally important. Family involvement is a part of Mrs. Rodriguez's cultural identity. The priority Cory places on adapting to his client's needs is a part of his cultural identity as a nurse. Why? It's something Cory has learned, supported by his commitment to evidence-based practice. It shapes his role as a health care professional, affecting his interactions with clients and his decisions about how to approach client care.

Culture significantly influences many aspects of life, including the health of individuals and of populations. Population health emphasizes equitable access and quality of care regardless of a person's background. Nurses who recognize and respond to the role culture plays in client health provide higher-quality care and achieve better outcomes for their clients. The ability of a nurse to provide safe, quality care regardless of cultural identities depends on developing cultural sensitivity, cultural awareness, and cultural humility, and that process begins with an examination of their own attitudes, values, and beliefs. See [Cultural Influences on Health Beliefs and Practices](#) for more information on cultural identity.

Cultural Humility and Cultural Awareness

Cultural humility refers to being open-minded and reflective about one's own values and beliefs, along with acknowledging, respecting, and valuing cultural differences. A nurse practicing cultural humility will demonstrate a

desire to understand other perspectives. Developing cultural humility begins with self-reflection, open communication, and collaboration with diverse groups and populations. Yet this isn't enough—cultural humility also requires awareness of one's own biases and how they may impact interactions with people from other backgrounds.

One way to learn about cultural humility is to explore and come to appreciate different cultures and their beliefs and values. Although no one can possess knowledge of every culture they interact with, to provide quality care, nurses should strive for **cultural awareness**. Cultural awareness in nursing is defined as “the process of understanding and respecting the beliefs, customs, languages, and values of clients from diverse cultures” (Giger & Haddad, 2020). It recognizes that culture shapes perspectives and experiences, influences the way people express themselves, and acknowledges that a client's or group's cultural norms may differ from those most often found in conventional health care settings. Cultural awareness is rooted in values such as openness, fairness, and mutual understanding.

Evidence shows that when nurses engage in positive, respectful, trusting, and caring interactions with clients, these clients experience better health outcomes. To develop such relationships with a broad range of people from varied backgrounds, nurses must become culturally aware and engage in cultural humility. Respectful relationships prioritize client self-determination and promote greater equity. They are at the heart of providing culturally and linguistically responsive nursing care.

23.2 What Is Culturally Responsive Care?

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 23.2.1 Describe culturally responsive care.
- 23.2.2 Explain the basic concepts of culturally competent nursing care.
- 23.2.3 Discuss the relationship between cultural competence and health outcomes.
- 23.2.4 Describe how valuing and respecting diversity affect health care.

Culturally responsive care fully considers the cultural backgrounds, values, and preferences of individuals, groups, and populations. Culturally responsive care goes beyond being aware of a culture; it involves actively ensuring that all aspects of health care are customized to address the needs and beliefs of the specific population (Schwartz, 2023; Schwartz & Silva, 2023). Nurses who provide culturally responsive care do so by aligning their practice with the values, beliefs, and practices of a client or population. Culturally responsive care improves a nurse's ability to understand, communicate with, and effectively provide care to individuals from diverse cultural backgrounds, resulting in improved health outcomes for individuals and communities.

Cultural Competence and Culturally Congruent Care

Culturally responsive care is one potential outcome of the dynamic process of **cultural competence**. Although many definitions of cultural competence exist, this chapter uses the one adopted by the American Association of Colleges of Nursing: “cultural competence encompasses the attitudes, knowledge, and skills necessary for providing quality care to diverse populations” (AACN, 2008, p. 1).

The concept of cultural competence in nursing has its roots in the work of Cross et al. (1989) and has since expanded to encompass critical components for effective cross-cultural interactions, such as cultural awareness, cultural humility, and cultural sensitivity. The idea of cultural competence in nursing care can be traced back to Leininger's book *Nursing and Anthropology: Two Worlds to Blend* (1970). As discussed in [Transcultural Nursing](#), the field of transcultural nursing has since grown, generating a major theory, several models, and hundreds of research studies. As a result, professional organizations and educational institutions have begun incorporating cultural competence into their policies, standards, and curricula (Marion et al., 2016).

In 2014 the American Nurses Association formed a work group of 40 expert nurses to review and revise the 2010 version of the nursing scope and standards of practice. The work group reviewed all scope statements and standards in light of the increasing cultural and ethnic diversity in health care and the rise in humanitarian needs. Recognizing the need for nurses to have expert guidance on how to provide **culturally congruent care**, or care that is aligned with a client's culture, the work group developed a new Standard 8, Culturally Congruent Practice, to describe “nursing care that is in agreement with the preferred values, beliefs, worldview, and practices of the healthcare consumer” (American Nurses Association, 2015, p. 31). This standard sets expectations for nurses' education, legal responsibilities, and societal obligations. Cultural congruence is a fundamental part of nursing

practice and is integral to the agreement between the profession and society. Standard 8 provides guidance for implementation by practicing nurses (Marion et al., 2016).

The latest research emphasizes the importance of improving nurses' ability to provide culturally congruent care (Im & Chee, 2021). Culturally congruent care is the implementation of evidence-based nursing practice that recognizes and is consistent with the values, beliefs, worldviews, and practices of clients and populations, with the goal of improving health outcomes (Marion et al., 2016). It is customized to the needs of the client, group, or population. For example, a client with diabetes tells their nurse that they come from a culture with different health beliefs and practices and that they frequently consult with a traditional healer about their dietary choices. To provide culturally congruent care, the nurse prioritizes the client's beliefs and practices, collaborating with them to identify culturally appropriate foods and traditions, and then incorporates these preferences into the care plan. The nurse can then provide culturally responsive education to the client about their dietary choices and encourage them to continue incorporating healthy practices that are congruent with their culture.

Several critiques of cultural competence have emerged. While some health care professionals consider the process of cultural competence an imperative for reducing health inequities, others argue that it is based on ethnocentrism, a belief that one's own cultural values, traditions, and practices are superior to those of other cultures (Beser et al., 2021). According to this critique, the ethnocentric orientation of cultural competence can lead to stereotyping and, as a result, perpetuate already existing biases and inequities (Berger & Ribeiro Miller, 2021). Other critics argue that the process of developing cultural competence oversimplifies the complex nature of culture, reducing it to facts and easily acquired knowledge while failing to consider cultural change and variability (Campinha-Bacote, 2018). A recent shift toward culturally responsive care focuses on nurses' ability to recognize and respond inclusively to diverse perspectives, and it emphasizes the importance of social justice (Day & Beard, 2019).

The Significance of Culturally Responsive Nursing

A nurse's ability to provide effective, culturally responsive nursing care begins by exploring their own attitudes, beliefs, and values and involves an ongoing reflective process with the aim of providing culturally congruent care (Leininger, 1991, 1999). Nurses are not expected to know everything about every culture; acquiring such knowledge would be impossible. Although it is important for nurses to be aware of the different cultural groups prevalent in the areas where they practice, the only way to be certain of a client's or population's beliefs is to approach them with an open mind, inquire about preferences and needs, and listen with empathy and humility.

As the U.S. population becomes more diverse, cultural competence becomes increasingly important in health care. Studies have shown that when nurses provide care that responds to a client's or population's health beliefs and behaviors, they demonstrate more empathy, communicate more effectively, and provide more substantive client education (Sharifi et al., 2019). Nurses who practice this way can more readily navigate challenging situations when providing care for diverse populations. They are more likely to be aware of potential biases that can come into play when delivering care and are more likely and better able to take steps to minimize those biases. Building relationships of trust between communities and health care professionals can help ensure that individuals receive the appropriate care they need, regardless of their cultural backgrounds or differences. Incorporating culturally competent care is essential for promoting health equity, particularly for underserved groups that have faced significant health disparities and increased rates of illness and mortality. Culturally competent care therefore serves as a means of advocating for these clients' health and well-being (Pacquiao et al., 2023).

By understanding their clients' unique cultural needs, nurses can provide more effective and personalized care that encourages client collaboration and engagement. Culturally responsive care facilitates better communication between nurses and clients, improved health management, increased adherence to treatment plans, and greater client satisfaction, all of which can lead to improved health outcomes.

Social Determinants of Health and Health Inequities

Effective culturally responsive care relies on nurses' understanding of the social determinants of health, which are the conditions in which people are born, grow, work, live, and age, along with the wider set of forces and systems shaping the conditions of daily life that influence health outcomes. As discussed in [The Social Determinants of Health](#), these conditions include income, education, housing, environment, employment, and access to health care. Social determinants of health can create significant health inequities (Office of Disease Prevention and Health Promotion [ODPHP], n.d.-b). The unequal distribution of health care services, quality of care, and health status

among groups is based on factors such as race, ethnicity, culture, gender, ability, and socioeconomic status.

Health inequities are persistent across the United States. These inequities can follow a person from before birth throughout their lifespan, affecting the health and well-being of communities as well as individuals. Although their causes are systemic, health inequities are preventable. Culturally responsive nurses employ an understanding of the roots of health inequities to reduce them.

For example, some communities with high poverty levels are considered “food deserts,” areas where access to affordable and nutritious food is limited or nonexistent. Food deserts can occur due to a lack of grocery stores or farmers markets in the area, inadequate transportation options, or low income levels that make it difficult for residents to afford fresh, healthy food ([Figure 23.2](#)). Food deserts are a serious public health concern because they can contribute to various health problems, including obesity, diabetes, and heart disease.

FIGURE 23.2 People living in food deserts are often forced to rely on convenience stores and fast-food restaurants, which tend to offer unhealthy food options that are high in calories, fat, and sodium, resulting in a higher prevalence of chronic diseases. (credit: “Grand City Corner Store” by Paul Sableman/Flickr, CC BY 2.0)

A nurse who recognizes and considers the client’s environment will understand the impact of a food desert on the local community and can provide education and resources to help people obtain nutritious food and make healthier choices. They can also advocate for increased availability of nutritious foods in places such as corner stores, promote the incorporation of healthy foods into school meal programs, and work with clients to identify foods that are important to their cultural backgrounds and traditions.

Health inequities became especially apparent during the COVID-19 pandemic, when Black, Hispanic, Native American/Alaskan Indian, and Native Hawaiian/Pacific Islander individuals had a 1.5 times greater risk of contracting the infection than White individuals and were twice as likely to die. Various factors contributed to the higher disease and death rates, including greater exposure to the pathogen for essential workers, greater proportions of people living in crowded conditions, less access to health care, and a greater burden of chronic diseases (Alcendor, 2020).

Racial and ethnic minority groups endure higher rates of morbidity and mortality from chronic diseases. For example, the tuberculosis rate among Native Americans is nearly fifteen times greater than that among White Americans, at 4.4 vs. 0.3 cases per 100,000 people (Schildknecht et al., 2023). Life expectancy for Native Americans is 7 years lower than the national average, at 71.8 vs. 78.8 years (Arias et al., 2021). A higher proportion of rural adult Black and American Indian or Alaska Native individuals (40.3 percent for both groups) report having multiple chronic health conditions compared with non-Hispanic White individuals (36 percent). Individuals with chronic conditions need more health care and interact more frequently with health care providers and services; those without a primary care provider are less likely to have their chronic conditions managed. Although chronic illness is more prevalent among racial and ethnic minorities, in rural areas, for example, only 61.5 percent of Hispanic and 63.7 percent of Native American individuals report having a primary care provider.

Younger Black adults live with and succumb to health conditions typically seen in White Americans in old age. For

example, 33 percent of Black adults aged 35 to 49 have diagnosed hypertension, compared with 22 percent of White adults in the same age group (Centers for Disease Control and Prevention [CDC], 2017). Diabetes rates show an even greater disparity: 10 percent of Black adults have diabetes compared with 6 percent of White adults. Among children, asthma prevalence in Black children (18.1 percent) and Native American/Native Alaskan children (18.0 percent) is nearly twice that of White children (9.5 percent), and it is alarmingly high among children of Puerto Rican descent (23.6 percent) (Asthma and Allergy Foundation of America, 2020). Early onset of these conditions leads to greater morbidity and earlier mortality. The challenges presented by structural racism and the social determinants of health are covered in more detail in Unit 2, Issues and Challenges of Population Health.

Culturally Responsive Care and Health Inequities

Culturally responsive care increases client satisfaction, reduces health inequities, and leads to improved outcomes. By promoting respect and understanding between nurses and clients, cultural humility and culturally responsive care can help reduce inequities because the client is more likely to understand, collaborate, and follow the recommended care plan, regardless of their background or circumstances.

Consider this example of the effects of culturally responsive care. Although Black newborns are more than twice as likely to die as White newborns (1,090 vs. 490 deaths per 100,000 births), this number is halved when the physician providing care to the newborn is also Black. This difference may be due to Black providers' recognition and understanding of the unique challenges and needs of babies born to people already prone to poorer health outcomes (Greenwood et al., 2020).

Health outcomes also improve when community preferences and needs are considered. Native Americans experience multiple structural inequities, including discrimination, poverty, forced relocation, and a history of trauma, all of which play a role in the high rates of substance misuse among some Native populations. In addition to these challenges, Native American communities often have limited access to quality health care services, including substance misuse treatment and mental health services. Nurses are responding to this need by advocating for culturally adapted, locally based interventions. For example, the Native Alaskan Yup'ik community-initiated alcohol abuse prevention program Qungasavik was developed as a toolbox for building on Native community strengths (Rasmus et al., 2014). Similarly, work by the Native Transformations Project identified the importance of family, community, and spirituality as protective factors against substance abuse (Rasmus et al., 2016).

CASE REFLECTION

A Culturally Responsive Approach to Working with a New Client

Read the scenario, and then respond to the questions that follow.

Cory, the community health nurse introduced at the start of this chapter, is meeting another new client in the clinic today. Faiza is a married 28-year-old woman who is trying to establish primary and obstetric care. Cory is scheduled to meet with Faiza to assist her in arranging for appropriate and timely care and to assess whether she needs other health-related resources. When Cory goes to the waiting room and calls Faiza's name, a man rises from his seat, and only then does the young woman seated beside him move her head and stand. The woman, who is wearing a hijab head covering, walks behind the man to the front of the room where Cory is waiting. The man says, "She is Faiza." Faiza does not look directly at Cory. Cory reaches his hand out to Faiza and says, "Hi, my name is Cory, and I'm the nurse you're seeing today; nice to meet you." Faiza does not look up and does not take Cory's hand. She says nothing and takes a small step backward. The man, who appears to be upset, says, "She needs a woman nurse. And she does not speak English, but I always translate for her."

1. Why do you think the man with Faiza requests a woman nurse?
2. Does anything about this scenario make you uncomfortable? If so, consider why.
3. What additional information should Cory obtain before proceeding?
4. How should Cory respond to the statements "She needs a woman nurse . . . she does not speak English . . . I always translate for her"?
5. What does the client's nonverbal communication (no eye contact, no handshaking, backward step) signify?
6. If the clinic cannot provide this client with a woman nurse, how should Cory proceed?

7. Do you think Cory should have done anything differently from the beginning?

(See Attum et al., 2022.)

23.3 Factors Affecting Culturally Responsive Care

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 23.3.1 Discuss the impact of personal factors on culturally responsive care.
- 23.3.2 Describe systemic barriers to providing culturally responsive care.
- 23.3.3 Identify strategies to overcome barriers to providing culturally responsive care.

Numerous factors can affect the process of providing culturally responsive care. These include both personal and systemic factors that may act as barriers. This section addresses both.

Personal Factors

Personal factors including value system, beliefs, customs, and cultural identity, as well as knowledge and attitudes about other cultures, play a role in nurses' interactions with clients. Cultural factors such as language and communication barriers, gendered roles, and health care practices can impact these interactions. Nurses who have limited experience interacting with clients from different backgrounds may lack cultural humility. These nurses may exhibit biases, othering, stereotyping, and ethnocentrism in their approach to care.

A nurse's age and educational preparation can also affect their provision of culturally responsive care. Younger generations are increasingly more diverse (Fry & Parker, 2018), and older individuals may be less familiar with changing cultural dynamics. Education can provide the knowledge, skills, and critical thinking tools to effectively interact with a wide range of people. Individuals educated in a diverse environment who have some cross-cultural knowledge may be more adept at interacting with people outside their own culture (Sharifi et al., 2019).

Socialization, personality, and prior experiences also play a role. For instance, people who were raised in diverse communities or who have traveled outside their own culture may feel more comfortable interacting with people from different cultures in a variety of settings, such as in the workplace, in social situations, and in their community.

Biases, Stereotyping, and Othering

Biases are prejudicial attitudes that filter the way people perceive, interpret, and react to the world. These opinions or beliefs (involving gender, race, age, or other categories) affect decision-making in ways that can be subtle or overt. When nurses focus only on certain information while ignoring other relevant data, their biases can lead to incorrect assumptions, judgments, and actions. In health care, biases can cause health care workers to draw false conclusions. They can lead to disparities in diagnoses and treatments, unequal access to services and resources, and slower response times. For example, due to bias, a nurse may view one group as lower priority and less deserving of care than other groups and, as a result, may not give clients from that group the same level of attention, fully explain procedures or medications, or advocate for them as strongly.

Bias can be both explicit and implicit. **Explicit bias** refers to clear and intentional feelings, attitudes, and behaviors; it exists at a conscious level and is often expressed verbally. When it reaches an extreme, explicit bias can manifest overtly as negative behaviors, such as physical or verbal harassment, or through more subtle forms, such as exclusion. **Implicit bias** is a type of prejudice that unconsciously affects a person's behavior, decisions, and attitudes, even if it contradicts their expressed beliefs and values. Because it operates at an unconscious level, the individual is not fully aware of their behaviors. Implicit bias undermines clinical assessments, the establishment of therapeutic relationships, and decision-making, all of which negatively affect health outcomes.

Bias among health care providers can have a substantial impact on an individual's or group's health. For example, evidence increasingly demonstrates that individuals who identify as LGBTQ+ experience significant disparities in their physical and mental health because of implicit biases (Lick et al., 2013). In a 2020 study, 24 percent of LBGTQ people of color reported some form of negative or discriminatory behavior from a health care provider in the previous year, and 19 percent stated they were cared for by a provider who was visibly uncomfortable with their sexual orientation (Mahowald, 2021).

THE ROOTS OF HEALTH INEQUITIES

Implicit Bias

[Access multimedia content \(<https://openstax.org/books/population-health/pages/23-3-factors-affecting-culturally-responsive-care>\)](https://openstax.org/books/population-health/pages/23-3-factors-affecting-culturally-responsive-care)

Implicit biases among nurses and other health professionals contribute to the persistence of health inequities. In this Institute for Healthcare Improvement video, Dr. Anurag Gupta discusses how different forms of implicit racial bias may negatively impact three areas of health care.

Watch the video, and then respond to the following questions.

1. What are the three manifestations of implicit racial bias Dr. Gupta describes?
2. How does implicit racial bias affect the care some clients receive?
3. What are some strategies nurses can use to identify implicit racial bias?

Stereotyping is the act of ascribing certain characteristics or behaviors to someone based on their membership, or perceived membership, in a particular group. Stereotyping can lead to assumptions about people based on race, ethnicity, religion, gender identity, age, socioeconomic status, ability, or sexual orientation that may not be accurate or fair. In health care, stereotyping can have a negative impact if it leads to unequal, inadequate, or inappropriate care of clients. Stereotyping can also create a barrier to effective communication between nurses and their clients, negatively impacting the quality of care. For example, a nurse working with an older adult may assume, based on the client's age, that they are not computer literate and therefore neglect to provide helpful online resources. Nurses must gather and use accurate information about their clients as individuals rather than relying on learned, and potentially damaging, assumptions.

Othering is the process of excluding, marginalizing, or differentiating individuals or groups based on their perceived differences from the dominant group in a society. Othering is used to separate individuals who do not fit social norms or expectations, and it often implies that a person or group is inferior. This can involve ascribing negative characteristics or traits, which can lead to feelings of isolation, discrimination, and social inequality. Othering can have harmful effects on individuals and communities because it can create barriers to social inclusion, equal opportunities, and fair treatment. It can also reinforce negative stereotypes and prejudices and prevent individuals and groups from being treated with dignity and respect. For example, a community health nurse is teaching a group of adults about the importance of smoking cessation. One of the clients who has been quiet throughout the session finally asks a question, speaking in a heavy accent. Rather than responding to the client the same way they answered questions from others in the group, the nurse speaks loudly and slowly, using very simplistic words and assuming that the client does not understand English. This behavior, while potentially meant to be helpful, can stigmatize, exclude, and isolate the client, ultimately having a negative impact on their health and well-being.

Ethnocentrism

Ethnocentrism, as previously mentioned, is the belief that one's own culture is superior to other cultures (Beser et al., 2021). Ethnocentrism involves judging others by the standards of one's own culture, assuming that one's own culture is the norm against which all others should be measured. Ethnocentrism can result in discrimination, bias, and suboptimal care. For example, a client newly diagnosed with heart failure has been prescribed a diuretic. The nurse is reviewing the medication with the client and asks if they have any questions. The client, feeling apprehensive, expresses a wish to consult with a traditional healer from their cultural group. Rather than encouraging collaboration, the nurse perceives the traditional cultural practices as inferior to their own cultural orientation to biomedicine. Assuming that non-Western medicine is ineffective or irrational while Western biomedicine is superior is an example of ethnocentrism. Nurses need to be aware of their own ethnocentric tendencies, striving to be more culturally aware and culturally sensitive. Practicing cultural humility (see [Attitudes, Skills, and Knowledge](#)) allows nurses to recognize the biases created by ethnocentrism and to emphasize the client's values, rather than those of the nurse or the dominant culture (Foronda et al., 2022).

Systemic Barriers to Providing Culturally Responsive Care

Some of the policies, practices, and procedures in U.S. health care present systemic barriers to providing culturally

responsive nursing care. These systemic barriers may be organizational or structural. Organizational barriers are related to a particular clinic, hospital, or other health care institution, whereas structural barriers result from factors in the broader health care environment—for example, the composition of the health care workforce, the workings of the U.S. health insurance industry, and state and federal laws governing the provision of health care.

Organizational Barriers

Barriers to cultural competence may exist within organizations. These barriers can be far-reaching in scope because they extend well beyond the individual. Organizational barriers include lack of diversity in the workforce, lack of education in cultural competence, inadequate or absent translation or interpretive services, policies and procedures that fail to consider a diverse clientele, and lack of support from leadership. Leadership in particular plays a key role in creating a culture of inclusion and respect for diversity, as well as in designing, implementing, and enforcing policies to support an inclusive workplace and provide culturally and linguistically responsive services (Office of Minority Health, n.d.). For example, a lack of support from organizational leaders who do not prioritize or value cultural competence makes it more difficult for nurses to provide culturally responsive care. Furthermore, because culture is ever changing, providing culturally responsive care requires a commitment to updating and maintaining programs and policies that support it.

Structural Inequities

Structural inequities in health care are the systemic barriers and disparities in the health care system that prevent certain individuals or groups from receiving optimal care. These inequities can be caused by a range of factors, including unequal access to health care resources, discriminatory policies and practices, and inadequate representation in the health care workforce. In the United States, lack of health insurance coverage and the cost of health care are structural inequities that greatly affect health outcomes. Specifically, among rural adults, 24.5 percent of Black and 23.1 percent of Hispanic individuals report not seeing a health care provider because of the cost, compared with 15 percent of White individuals (James et al., 2017). Although Black, Hispanic, and Native American individuals bear a greater burden of chronic diseases than White individuals do, more of them lack a consistent source of medical care, health insurance coverage, and the ability to afford care (James et al., 2017).

Another example of structural inequity is the unequal distribution of health care resources, such as diagnostic and treatment facilities, across different communities. For example, individuals in rural areas or those living in communities of lower socioeconomic status may have limited access to specialized medical care. This lack of access can have a significant impact on population health because it can result in individuals' not receiving the care they need, leading to an increase in preventable illnesses and chronic conditions.

A lack of representation of certain groups in the health care workforce is also a structural inequity. For instance, Black and Latina/Latino individuals are underrepresented in the health professions, including nursing, which can diminish efforts to provide culturally responsive care for clients from these backgrounds and reduce the quality of care provided. Evidence shows that the majority of Black (61.1 percent) and Hispanic (61.3 percent) adults prefer a health care provider who either shares or understands their culture. However, of those with this preference, 13.4 percent of Black and 14.7 percent of Hispanic individuals were never able to meet with such a provider, compared with 4 percent of White individuals (Terlizzi et al., 2019).

23.4 Becoming a Culturally Responsive Nurse

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 23.4.1 Demonstrate self-awareness in attitudes, beliefs, and values.
- 23.4.2 Explain the significance of valuing and respecting diversity.
- 23.4.3 Apply models of cultural competence.
- 23.4.4 Apply self-assessment tools to measure cultural competence.

The process of becoming a culturally responsive nurse is ongoing and informed by evidence-based practice. This section highlights the attitudes, skills, and knowledge required to engage in this process, and it examines how to apply three major theoretical frameworks for culturally responsive nursing practice. It also presents tools nurses may use to evaluate a client's cultural values, health perspectives, and disease behaviors, as well as tools for assessing and measuring their own cultural competence.

Attitudes, Skills, and Knowledge

The American Association of Colleges of Nursing definition of cultural competence is, above all, a call to action: It sets nurses the task of building the attitudes, skills, and knowledge necessary to provide quality care. What are these attitudes, skills, and knowledge?

An open, nonjudgmental attitude is essential to providing culturally responsive care. A culturally responsive nurse displays the following:

- An interest in learning about other beliefs and practices
- A willingness to engage in dialogue that encourages learning and mutual respect
- The motivation to challenge assumptions and biases
- A commitment to equity and inclusion
- The desire to help create a safe space for everyone

Among the many skills required to provide culturally responsive care, a few key skills should be part of every nurse's tool kit. Critical thinking is needed to identify and analyze policies, structures, and practices that are oppressive or that disadvantage certain individuals or groups. Linguistic competence is necessary for communicating effectively with people from different backgrounds and for listening empathetically and openly (see [Linguistically Responsive Care](#)). The ability to adapt to new cultural environments and navigate unfamiliar situations is essential. Culturally responsive attitudes also include approaching diversity positively, valuing and respecting cultural differences, practicing cultural humility, and not discriminating against individuals on the basis of culture. These attitudes support cultural awareness, one of the skills most critical to providing culturally responsive care.

Valuing and Respecting Diversity

Valuing diversity means recognizing that everyone is unique and that diversity is a valuable aspect of society. It involves treating all individuals with respect and without discrimination and being open to learning from, and collaborating with, people from diverse backgrounds. Valuing diversity can foster a more inclusive and welcoming environment, and it can lead to better outcomes for both individuals and organizations.

What does valuing and respecting diversity look like? It begins with recognizing the unique backgrounds, experiences, and perspectives of clients and colleagues, including varied cultural health beliefs and practices. For example, a nurse serving a community that has experienced a recent influx of immigrants could follow local news stories about the new immigrant population and read books and articles about the immigrant group's culture to develop a baseline knowledge that would become richer and more informed with each client interaction.

Nurses can engage with people from different backgrounds and cultures, both at work and socially, to get to know them and better understand their perspectives. An open mind is critical, as are effective communication and a willingness to learn from others. Nurses should advocate for diversity and inclusion in the workplace and recognize any personal biases or stereotypes that may impact their interactions with others. Self-awareness is key to both understanding one's own perspective and challenging it. By taking these steps, nurses can show their commitment to valuing and respecting diversity, thereby fostering a more inclusive and nurturing environment for their clients, colleagues, communities, and organizations.

Developing Self-Awareness

To value and respect diversity, nurses must recognize and understand their personal biases, values, and beliefs; the ways those are influenced by their own cultural backgrounds; and the ways they influence their own perceptions and behaviors. To achieve that recognition and understanding, nurses must seek **self-awareness** (Foronda et al., 2018). This self-awareness can enable a nurse to identify the role their own biases, values, and beliefs play in their interactions with clients, nurse colleagues, and other health care professionals. Each nurse needs to examine their own life experiences, family background, cultural traditions, religious beliefs, health practices, and personal preferences. Because values change over time, it is helpful for nurses to consider how their biases, values, and beliefs have developed and to reflect on how they may be continuing to evolve. Nurses need to examine their own biases to ensure they are not perpetuating any stereotypes or prejudices, and they need to reflect on their own values and beliefs to identify how they may help or hinder their ability to provide culturally responsive care.

To develop self-awareness and identify hidden biases, nurses can start by reflecting on their experiences, cultural background, and stereotypes and how these may impact their ability to objectively evaluate and care for others. The

[Implicit Association Test \(IAT\) \(https://openstax.org/r/takeatest\)](https://openstax.org/r/takeatest), a psychological tool designed to measure bias and the impact of unconscious attitudes and beliefs on day-to-day decision-making, can help nurses identify their hidden biases (Project Implicit, 2011). Nurses can challenge their biases by engaging in open and respectful conversations with people from different backgrounds, asking questions to learn more about the experiences and perspectives of others.

Participating in activities that embrace and promote diversity can also help nurses develop self-awareness and cultural understanding. Such activities include attending cultural events, volunteering at health clinics that serve immigrant communities, and attending interfaith services. By engaging in these activities, nurses can continue to learn and grow in their understanding of individuals and groups from diverse cultural backgrounds, building the skills and knowledge necessary to provide compassionate, culturally congruent care to their clients. [Managing the Dynamics of Difference](#) describes strategies for developing cultural awareness in more detail.

The Central Vancouver Island Multicultural Society (2021) has developed a [cultural competence self-assessment checklist \(https://openstax.org/r/culturalcompetencechecklist\)](#) that individuals can use to check their progress toward developing cultural competence.

CONVERSATIONS ABOUT CULTURE

What Is Cultural Competence?

[Access multimedia content \(https://openstax.org/books/population-health/pages/23-4-becoming-a-culturally-responsive-nurse\)](#)

In this Kentucky Inclusive Health Collaborative (2021) video, people speak about the different ways they identify themselves and how they feel health care professionals' perceptions of them affect the care they receive.

Watch the video, and then respond to the following questions.

1. What are the different terms you use to describe your identity?
2. How may others' perceptions of your identity affect the health care you receive?
3. What can you do to increase your cultural competency as a nurse?
4. What effect does your level of cultural competency have on your clients?

Applying Models of Cultural Competence

[Transcultural Nursing](#) introduced several frameworks for providing effective, culturally appropriate nursing care that produces positive, equitable outcomes. These models can serve as tools for considering how best to provide culturally responsive care.

Campinha-Bacote's Process of Cultural Competence Model

Campinha-Bacote's process of cultural competence model emphasizes that cultural competence is not a fixed attribute or trait but rather a process that health care professionals engage in to provide high-quality, effective care to clients from diverse cultural backgrounds (Campinha-Bacote, 2002). This process has five components: cultural awareness, cultural skill, cultural knowledge, cultural encounters, and cultural desire.

- **Cultural awareness** involves examining and exploring one's own cultural background, beliefs, and biases and consciously avoiding them when interacting with clients from other cultures.
- **Cultural skill** is the ability to collect cultural data, perform culturally sensitive assessments, and consider biological and physiologic variations.
- **Cultural knowledge** serves as a foundation for understanding the diversity of cultural groups.
- **Cultural encounters** are interactions with clients from different cultural backgrounds.
- **Cultural desire** is the motivation to engage in the process of becoming culturally competent and to provide culturally responsive care.

Recently, Campinha-Bacote refined her model to include **cultural competemility**, the combination of cultural competence and cultural humility in the delivery of health care services (Campinha-Bacote, 2018), to encourage health care professionals to be culturally humble throughout the process of cultural competence.

Because Campinha-Bacote's model specifically examines the process of cultural competence, it is easy to use in clinical situations. For example, a nurse who is motivated to engage in the process of cultural competence expresses a desire to provide culturally responsive care for a client from a religious background that observes dietary restrictions. Through cultural awareness, the nurse recognizes that the client's beliefs and traditions may impact which foods they can eat. Therefore, the nurse clarifies these preferences during their assessment and continues to use cultural assessment skills to seek knowledge about the client's dietary practices.

The Giger and Davidhizar Transcultural Assessment Model

Giger and Davidhizar's transcultural assessment model (Giger & Haddad, 2020) is used to evaluate a client's cultural values and perspectives of health and disease behaviors. According to this model, every individual is culturally unique and should be assessed according to six phenomena: communication, space, social organization, time orientation, environmental control, and biological variations.

- Communication, both verbal and nonverbal, transmits cultural norms and expectations, thereby conveying meaning and forming identity.
- Space refers to the distance between individuals when they interact; different cultural groups have different behaviors concerning personal distance and physical interaction.
- Social organization refers to how a cultural group is organized and includes factors such as family structure, religious values, and role assignments.
- Time orientation, which is the perspective and value placed on the past, present, or future, can vary based on culture.
- Environmental control refers to the belief in one's ability to control and plan for factors in the environment.
- Biological variations are differences between individuals in developmental patterns, disease prevalence, and genetic variations.

Nurses may use Giger and Davidhizar's transcultural model to evaluate how different individuals and groups perceive and approach illness to develop tailored plans of care. For example, some cultures place a greater emphasis on the present and less value on planning for the future. This can affect the way group members approach health care, such as their willingness to adhere to long-term treatment plans or to obtain preventive care. On the other hand, cultures that have a more future-oriented perspective place greater emphasis on planning and preparing for the future, including taking steps to prevent illness and maintain good health.

Another example of this model's application is to consider how, in some cultures, illness may be viewed as a natural part of life, with more emphasis on the social and spiritual aspects of disease than on physiologic or biological manifestations. Individuals from these cultural backgrounds may prefer to seek care from traditional healers or practitioners instead of, or in addition to, Western medical care. In contrast, Western culture emphasizes biomedical explanations for illness and tends to prioritize evidence-based interventions. When differences arise, it is critical for the nurse to remain nonjudgmental and respectful of the client's preferences. For example, if a client expresses a desire to receive acupuncture, the nurse should work with the client and healer to develop a culturally congruent care plan ([Figure 23.3](#)). This care plan should be communicated to all members of the care team and tailored to the individual's needs.

FIGURE 23.3 Some clients may seek care from traditional healers or other practitioners of complementary and alternative medicine. A nurse would incorporate these practices into a culturally congruent care plan. (credit: “Curandera-Traditional Healers” by Larry Lamsa/Flickr, CC BY 2.0)

The Purnell Model for Cultural Competence

The Purnell model for cultural competence (Purnell, 2019) promotes cultural awareness and appreciation in the context of health care. Consisting of 12 domains of cultural knowledge, the model covers a wide range of concepts and skills related to cultural competence. Each domain includes a range of topics related to cultural differences and their impact on health care. For example, the death rituals domain identifies a client's beliefs and practices related to death, dying, and bereavement. Pregnancy and childbearing practices vary widely around the world; this domain covers cultural beliefs and practices related to fertility, birth control, pregnancy, childbirth, and postpartum care. See [Transcultural Nursing](#) for more about the Purnell model.

Nurses can implement Purnell's model throughout the nursing process, using their clinical judgment and collaborating with the client to select and emphasize the components that are most relevant to the individual client's care (Purnell & Fenkl, 2021). For instance, using Purnell's model, a nurse caring for a Native American client who follows traditional spiritual practices would elicit the client's views and preferences about incorporating care from a tribal healer and then work to facilitate that collaboration if the client desires.

CASE REFLECTION

Culturally Responsive Approaches to Transgender Care

Read the scenario, and then respond to the questions that follow.

Joseph, a 25-year-old Black transgender man, arrives at the community clinic seeking information about the services provided. Joseph explains that, despite his gender identity, his legal documents still reflect his assigned female name, Jada. Last month, Joseph began hormone therapy to increase his masculine features and is considering gender-affirming surgery that will include breast reduction and a hysterectomy. During his visit, he appears nervous and jittery and avoids making eye contact. Joseph explains that he recently had unprotected sex and is concerned about his HIV status.

1. How should a nurse begin their encounter with Joseph?
2. How might personal factors affect a nurse's interaction with Joseph?
3. Identify other factors that can impact Joseph's experience and care.
4. Using Giger and Davidhizar's transcultural assessment model, how would you provide culturally responsive care to Joseph during his first visit to the clinic?

5. Alternatively, how would the use of Purnell's model inform the care provided to Joseph?

(See White et al., 2020.)

THEORY IN ACTION

Cultural Competence

[Access multimedia content \(<https://openstax.org/books/population-health/pages/23-4-becoming-a-culturally-responsive-nurse>\)](https://openstax.org/books/population-health/pages/23-4-becoming-a-culturally-responsive-nurse)

In this Human Rights Campaign (2011) video, Cecelia Chung, a transgender client, tells her story of discrimination in the health care system and how she learned to advocate for her own care.

Watch the video, and then respond to the following questions.

1. How could you apply Giger and Davidhizar's transcultural assessment model to improve the care that Cecelia Chung received?
2. Describe how the Purnell model for cultural competence could be applied to Cecelia Chung's health care encounter to positively impact the outcomes.
3. In what ways can you use the Campinha-Bacote process of cultural competence model to improve health care encounters for all individuals?

Tools for Measuring Cultural Competence

Although the importance of cultural competence is well recognized in nursing, developing accurate and reliable assessment tools to measure it has been challenging. Measurement tools provide nurses with a way to assess their own development of cultural competence and confidence when caring for clients from different backgrounds. A recent review of tools to measure cultural competence found that only a limited number have been tested (Yadollahi et al., 2020), two of which are presented here. These tools provide nurses and nursing students a means for self-assessment of their development of cultural competence and self-efficacy in providing culturally responsive care.

The **Inventory for Assessing the Process of Cultural Competence Among Healthcare Professionals** (IAPCC-R) is used to assess the cultural competence of health care professionals according to the five constructs of Campinha-Bacote's model (Camphina-Bacote, 2002). The IAPCC-R consists of 25 items evaluated using a four-point scale. Scores on the IAPCC-R range from 25 to 100, with higher scores indicating a higher level of cultural competence. The inventory has been widely used in health care research and has been translated into multiple languages, including Swedish, Hebrew, German, Spanish, Korean, Finnish, French, and Japanese. However, one criticism of the tool is that the reading level is very advanced, potentially making it more difficult to use than others.

The **Transcultural Self-Efficacy Tool** (TSET) is designed to measure the confidence of nurses and nursing students on a 10-point scale ranging from 1 (not confident) to 10 (fully confident) in providing transcultural nursing care (Jeffreys & Dogan, 2010). It consists of 83 items in three categories: cognitive, practical, and affective. The cognitive subscale assesses self-efficacy, or confidence, regarding knowledge about caring for clients from different cultural backgrounds; the practical subscale evaluates self-efficacy in cross-cultural interactions; and the affective subscale assesses self-efficacy regarding cultural awareness, acceptance, and respect for other cultures.

23.5 Linguistically Responsive Care

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 23.5.1 Identify factors that affect communication with clients from diverse backgrounds.
- 23.5.2 Compare and contrast communication patterns in high- and low-context cultures.
- 23.5.3 Explain the effects of low health literacy on health outcomes.
- 23.5.4 Use effective communication strategies with clients with low literacy and low health literacy.

Cultural and linguistic competence refers to the ability of health care professionals and health care organizations to understand and respond effectively to the cultural and linguistic needs clients bring to the health care encounter.

Like cultural competence, **linguistic competence** exists along a continuum and is not based on comprehensive knowledge. Linguistic competence enables nurses to care for clients with limited English proficiency. It involves providing these clients easily accessible and culturally appropriate language services, both written and oral. It also requires an awareness of how verbal, nonverbal, and written messages may vary across cultures. Nurses who understand the relationship between communication and cultural identity can adapt their communication to meet each client's needs and preferences. This adaptation includes being mindful of a client's communication preferences and cues and trying to understand and respect them.

Linguistically competent care begins with assessment. The first step is to identify the client's primary language, by asking either the client, a family member, or another individual who is familiar with the client's language. If the client does not speak the same language as the health care provider, the nurse must use a certified medical interpreter to facilitate communication (see [Working with Translated Materials and Interpreters](#)). When communicating with clients with limited English proficiency, nurses need to use clear and simple language, avoid medical jargon and technical terms, and give the client ample time to express themselves and to ask questions.

The Office of Minority Health (n.d.) has developed standards that provide information, resources, and continuing education opportunities for health care professionals to learn about **culturally and linguistically appropriate services** (CLAS). [CLAS \(<https://openstax.org/r/enhancenational>\)](https://openstax.org/r/enhancenational) emphasizes the importance of tailoring health care services to an individual's culture and language preferences, respecting and responding to the health needs and preferences of all individuals to achieve health equity, and ensuring that everyone has access to high-quality care.

Differences in Communication Styles

Cultural variations in communication can significantly affect how health care professionals and clients interact and how individuals understand and interpret messages. Nurses need to understand how communication styles differ across cultures. By adapting their communication to align with the client's preferences, nurses can avoid potential misunderstandings and communicate more effectively with clients from different backgrounds.

Tone, volume, and speed of speech vary among cultures. Loud, fast, and expressive speech is customary for some individuals, whereas others may perceive it as rude or aggressive. Clients from some cultures may consider it rude or disrespectful to make eye contact while speaking to a health care provider, whereas others may consider it a sign of attentiveness and respect. In some cultures, low facial expressiveness is considered typical, whereas other cultures may view it as indicating a lack of interest or even resistance. Culture can also influence the level of emotional expressiveness considered appropriate in social interactions. Some clients may be more open about discussing their feelings and expressing emotions, whereas others may consider it inappropriate to show strong emotions in public or to discuss their health with people who are not close friends or family. As always, it is important to follow the client's cues in order to provide culturally and linguistically responsive care.

Cultural differences in communication can impact the way that people understand and interpret messages. For example, in **high-context cultures**, such as those found in Latin American and Asian countries, communication tends to be more subtle and rely more on nonverbal cues and context. Words alone may not convey the full meaning of a message, so nurses should consider the context and relationships between people when communicating. In addition, it may be considered rude or disrespectful to be overly direct, particularly when discussing negative or embarrassing topics; instead, these cultures may use more subtle and implicit language, with a focus on harmony and the interpersonal relationship. In contrast, in **low-context cultures**, such as those found in North America and Northern Europe, people tend to be more direct in their communication, using clear and explicit language.

In some cultures, communication is more oriented toward the self, whereas in others it is more focused on other people. This difference can be seen in the way people use "I" statements versus third-person language and plural pronouns. In the United States, where the dominant cultural norm is individualistic, people tend to speak in terms of their own experiences and preferences. In contrast, many other cultural groups are more collectivistic, meaning they prioritize the needs and perspectives of the group or community over those of the individual. For members of these cultures, it may be more common to speak in the third person and to use plural pronouns, such as "we" or "they," rather than "I."

Health Literacy

Health literacy—the ability to access, understand, and use health information and services to make informed

decisions about one's health—ensures that individuals are empowered to take positive actions to improve their health and well-being. Individuals who are health literate can understand and use health-related information and services. Health literacy enables people to read and comprehend medical instructions and labels, follow a treatment plan, and communicate effectively with health care providers, all of which can lead to better health outcomes. Health literacy can also reduce health care costs by preventing unnecessary hospitalizations and other costly interventions. Additionally, health literacy is important for reducing health disparities and promoting health equity.

Research has demonstrated that health literacy can have numerous positive impacts on health care (Shahid et al., 2022). Health literacy increases the use of preventive health care, reduces unnecessary emergency department visits and preventable hospital stays and readmissions, decreases medication errors, and assists clients in better managing chronic conditions such as diabetes, high cholesterol, hypertension, and HIV. Moreover, it can increase client satisfaction, improve overall health outcomes, and enhance client safety, and it results in greater cost savings for the health care system (McDonald & Shenkman, 2018).

HEALTHY PEOPLE 2030

Increasing the Health Literacy of the U.S. Population

One overarching goal of Healthy People 2030 is to remove health disparities and improve [health literacy](https://openstax.org/r/priorityareas) (<https://openstax.org/r/priorityareas>) in all people (ODPHP, n.d.-a). Health literacy is the ability to access, understand, and use health information and services to make informed decisions about one's health. Healthy People 2030 identifies health literacy as being vital to reaching all Healthy People 2030 objectives. However, health information can be difficult to understand, especially in those with limited English proficiency. Healthy People 2030 has expanded its definition of health literacy to emphasize not only things individuals can do to improve health literacy but also the role that organizations play in helping individuals find, comprehend, and use health information and services to participate in decisions about their care. This new definition goes beyond simply ensuring that individuals understand health information: It focuses on the individual's ability to use this information to make well-informed choices.

Low literacy refers to the inability to read, write, and comprehend basic information. It is a widespread issue; an estimated 21 percent of adults in the United States have low literacy levels (U.S. Department of Education, 2019). Individuals with low literacy have limited ability to access information, learn new skills, and fully participate in society. Low literacy is often linked to other socioeconomic factors, such as poverty, low education levels, and limited access to health care. It can negatively impact health outcomes because those with low literacy may struggle to understand health information, follow treatment plans, and manage their own health.

Effectively communicating with clients with low health literacy involves using plain, nonmedical language; speaking clearly and slowly; and being specific and concrete, avoiding vague or subjective terms such as "not well" and "a few." Common words one would use to explain medical information to friends or family, such as "stomach" or "belly" instead of "abdomen," are appropriate. Nurses should pay attention to the words clients use to describe their illness and then use those words in conversation. Showing a client how to do something, such as performing an exercise or taking medicine, may be clearer than verbal explanations.

23.6 Providing Culturally and Linguistically Responsive Care

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 23.6.1 Identify strategies to use when communicating through an interpreter.
- 23.6.2 Apply principles of culturally responsive care to clients and populations from diverse cultures.
- 23.6.3 Evaluate translated materials for accuracy and effectiveness.

Nurses use a number of strategies to provide clients with culturally and linguistically competent care. These include evaluating translated materials, using communication strategies, and developing culturally tailored interventions. This section provides an overview of the skills necessary to deliver culturally responsive care and improve the health outcomes of clients from diverse cultures.

Working with Translated Materials and Interpreters

Translation and interpretation are two different processes used to exchange information from one language to another. For both, a thorough knowledge of cultural and linguistic differences is necessary to effectively communicate meaning. **Translation** involves written communication, in which written text in one language is converted into written text in another language. **Interpretation**, on the other hand, involves oral communication, in which the words spoken in one language are rendered into another language in real time. Because of the difficulties presented by the live setting, interpretation can be more challenging than translation, such as when the speakers use the wrong words, correct themselves, or use local dialects. Furthermore, unlike the translation process, interpreters lack the ability to review the text or go back and listen again. These disadvantages can make it more difficult for interpreters to accurately convey the meaning of the message.

In any clinical setting, it is critical to use certified medical interpreters, professionals trained in the use of medical terminology, cultural awareness, and ethical conduct. The interpreter should be treated as a respected professional, and extra time should be allotted for messages to be conveyed and understood ([Figure 23.4](#)). The environment should be free of distractions, and the interpreter should be provided with a summary of the client's background, goals, and needs for the session. The name of the interpreter should be clearly documented.

FIGURE 23.4 A medical interpreter communicates information from a nurse to a client at a health clinic in Uganda. (credit: Staff Sgt. Samara Scott/U.S. Army Southern European Task Force, Africa/Flickr, CC BY 2.0)

When working with a client who needs an interpreter, the nurse should speak directly to the client rather than addressing the interpreter, even if the client makes eye contact with the interpreter. The nurse should observe and monitor nonverbal communication. Sentence-by-sentence interpretation and clear, simple language without medical jargon will ensure that the nurse and interpreter convey all important information to the client. The interpreter may ask open-ended questions to establish rapport or clarify client statements; during these times, the nurse should avoid interrupting the interpreter. Finally, near the end of a visit, the nurse should use the “teach-back” method to confirm that the client understands the directions and recommendations.

As a student or professional nurse, you may find yourself in a situation where a certified medical interpreter is not present. In these situations, it is critical to follow organizational policy and consult with leadership to locate or access remote interpretation services. Family members or friends should never be used as interpreters under any circumstances. The reasons for this are many, including a potential lack of accuracy, violation of privacy, potential conflicts of interest, and ethical and legal concerns. Think back to Cory’s interaction with Faiza. How should he have responded when the man accompanying Faiza offered to translate for her? What if the man accompanying Faiza is not actually her husband but a trafficker who has been forcing Faiza into providing commercial sex?

Developing Culturally Tailored Materials

Nurse scientists have made significant contributions to the development and implementation of culturally tailored materials and interventions to address the specific needs of different cultural groups and to improve their engagement and outcomes. According to nurse researcher Miyong Kim, adapting materials and interventions to

respond to a client's or population's cultural needs should consider eight domains: 1) audience, 2) language, 3) contents, 4) context, 5) concepts, 6) metaphors, 7) methods, and 8) goals (Kim et al., 2022). For example, culturally tailored materials use language, content, and ideas that reflect the values and traditions of the targeted cultural group; align with belief systems; and frame outcomes within the customs and traditions of the targeted group.

When a professional nurse designs a culturally tailored intervention, they first identify the cultural group on which the intervention will focus. This may be a specific ethnic or racial group, a religious group, a linguistic group, or any group that has unique customs, experiences, or perspectives. So that the intervention is appropriate, acceptable, and effective, research is needed to understand the beliefs, values, and practices related to the issue being addressed (Im & Chee, 2021). This research may involve adapting an existing intervention or creating new ones, using culturally appropriate materials such as visuals, activities, and language that are respectful of the culture. Members of the targeted cultural group are often involved to ensure that the intervention is tailored to their needs (Kim et al., 2022). Involving multiple community members in the review process can help create buy-in and awareness.

The U.S. Department of Health and Human Services has developed a strategy to create culturally tailored interventions using the mnemonic CAPABLE, in which each letter represents a consideration related to the best ways to meet a community's needs when developing educational materials (Kelly et al., 2007):

- Colors: Do the colors used have special significance for the target population?
- Art: Are the images appropriate for and reflective of the target population?
- Paper: If the materials are printed, is the paper easy to handle and read, and is its size appropriate for the target population?
- Access: Will the materials be placed in physically accessible locations? Should the information be provided electronically?
- Buy-in: Were members of the target population involved in developing or reviewing the materials? If so, do they endorse them?
- Language: Are the words in a type size most people will be able to read? Is the content easy to comprehend, appropriate for the community being served, and written at a level most readers will understand?
- Evaluation: What changes are needed to meet the needs of the target population?

After the intervention, the nurse should survey community members for feedback or observe health behaviors and outcomes to evaluate the impact of any changes made as a result of the materials. The findings would then be used to inform any revisions or additions to the materials.

CULTURAL ADAPTATION OF MATERIALS

[Access multimedia content \(<https://openstax.org/books/population-health/pages/23-6-providing-culturally-and-linguistically-responsive-care>\)](https://openstax.org/books/population-health/pages/23-6-providing-culturally-and-linguistically-responsive-care)

This video from the CDC (2020) discusses best practices for making materials more culturally relevant for clients.

Watch the video, and then respond to the following questions.

1. Why is it necessary to develop culturally adapted materials and make them available for clients?
2. What are some potential barriers or challenges nurses and other health care professionals may face when developing culturally adapted materials for clients? How can these be overcome?
3. In what ways can culturally adapted materials enhance client engagement, health literacy, and adherence to treatment plans?

Chapter Summary

23.1 Culture, Cultural Identity, and Cultural Humility

Individuals and groups pass culture from one generation to the next in a dynamic process that influences a person's actions and helps to shape their identities, roles, and lifeways. Cultural identity is the unique combination of beliefs, values, attitudes, behaviors, customs, practices, experiences, and language that make up an individual's sense of belonging to a particular group. To provide culturally and linguistically responsive nursing care, nurses must develop cultural humility and awareness and prioritize client self-determination.

23.2 What Is Culturally Responsive Care?

Culturally responsive care fully considers the needs of individuals and groups in relation to their cultural backgrounds, values, and preferences and is one potential outcome of the dynamic process of cultural competence. A nurse's ability to provide effective, culturally responsive care involves ongoing reflection about their own attitudes, beliefs, and values, as well as an understanding of health inequities and the social determinants of health.

23.3 Factors Affecting Culturally Responsive Care

Personal factors that affect a nurse's ability to provide culturally responsive care include value system, beliefs, customs, cultural identity, and knowledge and attitudes about other cultures. Implicit and explicit biases, stereotypes, othering, and ethnocentrism play a role in nurses' interactions with clients. Barriers to providing culturally responsive nursing care include systemic and organizational barriers within the health care system and structural inequities in the broader health care environment.

Key Terms

biases prejudicial attitudes or preconceptions that act as filters to the way one perceives, interprets, and reacts to the world

cultural awareness the state of examining and exploring one's cultural background, beliefs, and biases and consciously avoiding these biases when interacting with clients from other cultures

cultural competemility the combination of cultural competence and cultural humility in a synergistic process that infuses cultural humility into the five components of the Campinha-Bacote process of cultural competence model, encouraging health

23.4 Becoming a Culturally Responsive Nurse

Culturally responsive attitudes include a positive approach to diversity, respect and equal treatment for cultural differences, and cultural humility. Models of cultural competence offer ways to best provide culturally responsive care and include Campinha-Bacote's process of cultural competence, Giger and Davidhizar's transcultural model, and the Purnell model of cultural competence. Tools for self-assessment of cultural competence include the IAPCC-R and the TSET.

23.5 Linguistically Responsive Care

Cultural and linguistic competence is the ability to understand and respond effectively to the culturally diverse needs that clients bring to health care encounters. Different communication styles affect how individuals interpret messages and may involve tone, volume, and speed of speech; eye contact; facial expressions; emotional expressiveness; and high- and low-context communication. Promoting health literacy—the ability to access, understand, and use health information or services to make informed decisions—can reduce health disparities.

23.6 Providing Culturally and Linguistically Responsive Care

Strategies to provide clients with culturally and linguistically competent care include translation, interpretation via certified medical interpreters, observation of nonverbal communication, use of jargon-free language, the “teach-back” method, and culturally tailored materials. Such strategies address the specific content, language, and delivery needs of different clients and can improve their engagement and outcomes.

care professionals to be culturally humble in the delivery of health care services (Campinha-Bacote, 2018)

cultural competence the attitudes, knowledge, and skills necessary for providing quality care to diverse populations (American Association of Colleges of Nursing, 2008)

cultural desire in the Campinha-Bacote process of cultural competence model, the motivation to engage in the process of becoming culturally competent and the commitment to providing culturally responsive care

cultural encounters in the Campinha-Bacote process of cultural competence model, deliberate interactions with clients from different cultural backgrounds intended to modify or refine one's existing beliefs about one's own culture and help prevent stereotyping

cultural humility acknowledging, respecting, and valuing cultural differences by taking responsibility for one's own perceptions and ideas; cultivating a deep respect for all cultures represented; and striving to learn more about and understand different people's perspectives

cultural identity the unique combination of beliefs, values, attitudes, behaviors, customs, practices, experiences, and language that make up an individual's sense of belonging to a particular group or culture

cultural knowledge in the Campinha-Bacote process of cultural competence model, the foundation for understanding the diversity of cultural groups

cultural skill in the Campinha-Bacote process of cultural competence model, the ability to collect relevant cultural data in a culturally appropriate manner, perform culturally sensitive assessments, and understand how biological and physiologic variations can influence the accuracy of the data

culturally and linguistically appropriate services (CLAS)

services that emphasize the importance of tailoring health care to an individual's cultural and language preferences, respecting and responding to the health needs and preferences of all individuals to achieve health equity, and ensuring that everyone has access to high-quality care

culturally congruent care care that is meaningful to, and aligns with, a client's or population's health beliefs and behaviors (Leininger, 1991, 1999)

culturally responsive care the process of providing care to individuals or populations while fully considering their cultural backgrounds, values, and preferences; involves actively making sure that all aspects of health care are tailored to the needs and beliefs of the specific population

explicit bias overt prejudicial attitudes or preconceptions that exist at a conscious, intentional level and are often expressed verbally

high-context culture a communication style that relies more on nonverbal cues, context, and

relationships between people than on verbal language, meaning that words alone may not convey the full meaning of a message

implicit bias a type of prejudice that unconsciously affects a person's behavior, decisions, and attitudes, even if it contradicts their expressed beliefs and values

interpretation a process that occurs during oral communication in which the words spoken in one language are rendered into another spoken language in real time

Inventory for Assessing the Process of Cultural Competence Among Healthcare Professionals Revised (IAPCC-R)

a tool used to assess the cultural competence of health care professionals according to the five constructs of Campinha-Bacote's model

linguistic competence the knowledge, attitudes, and skills that enable nurses to care and advocate for clients who communicate in a language other than the one most commonly spoken or understood in the service setting

low literacy the inability to read, write, and comprehend basic information

low-context culture a direct communication style that uses clear and explicit language

othering the process of excluding, marginalizing, or differentiating individuals or groups based on their perceived differences from the dominant group in a society

self-awareness a process that involves understanding one's own values and beliefs, how they are influenced by one's cultural background, and how they influence one's perceptions and behaviors

stereotyping the act of ascribing certain characteristics or behaviors to a person based on their membership in a particular group

Transcultural Self-Efficacy Tool (TSET) a scale consisting of 83 items in the cognitive, practical, and affective categories that is designed to measure the confidence of nurses and nursing students in providing transcultural nursing care (Jeffreys & Dogan, 2010)

translation a process in which written text in one language is converted to written text in another language

Review Questions

- The nurse is assessing a client who lives in an area described as a food desert. The nurse identifies that the client is therefore at risk for which disorder?
 - Obesity
 - Parkinson's disease

- c. Multiple sclerosis
 - d. Chronic obstructive pulmonary disease
2. Which is an example of a nurse practicing culturally congruent care?
- a. Using evidence-based nursing practice
 - b. Practicing nursing according to the nurse's beliefs
 - c. Discouraging the use of a traditional healer
 - d. Using standardized care plans
3. Which term describes the actions of a nurse who orders a kosher diet for a Jewish client based on previous experience with other Jewish clients?
- a. Stereotyping
 - b. Bias
 - c. Othering
 - d. Ethnocentrism
4. Which concept does the nurse identify as an organizational barrier to culturally competent health care in a community?
- a. Not enough primary care providers in a community
 - b. A lack of medical interpreters
 - c. Absence of health care insurance
 - d. An inability to afford health care
5. Which construct do nurses exhibit when they engage in self-reflection about their own cultural beliefs and biases?
- a. Cultural skill
 - b. Cultural desire
 - c. Cultural awareness
 - d. Cultural knowledge
6. Which actions by the nurse demonstrate that the nurse values cultural diversity?
- a. The nurse discusses cultural diversity with people from their own culture.
 - b. The nurse compares other cultures to the nurse's culture.
 - c. The nurse treats everyone from the same culture in a similar manner.
 - d. The nurse volunteers at a free immigrant health clinic.
7. Which action should the nurse take when a client of a different culture than the nurse stares out the window while the nurse is providing preoperative instruction?
- a. Stare out the window with the client.
 - b. Move around the bed to stand in front of the client.
 - c. Observe how the client uses eye contact.
 - d. Stop the instruction and return later.
8. Which action should the nurse take when teaching a client with a low health literacy level?
- a. Use the correct medical terminology.
 - b. Speak in a loud voice.
 - c. Choose terms that the client uses.
 - d. Use verbal instruction only.
9. Which is the best action for the nurse to take when communicating with a client who speaks a language the nurse does not understand?
- a. Arrange for a medical interpreter.
 - b. Ask a family member to translate.

- c. Ask a clerical staff member who speaks the language to translate.
 - d. Use a smartphone app to translate.
- 10.** Which action should the nurse take when developing written educational materials for a specific population?
- a. Use black print on a white background.
 - b. Use appropriate medical terms.
 - c. Ask community members to review the materials.
 - d. Write at a high school reading level.

CHAPTER 24

Designing Culturally and Linguistically Appropriate Programs

FIGURE 24.1 Nurses and other health care providers often rely on medical interpreters to facilitate communication with clients if they do not share a common language. (credit: modification of work by Jeffrey Allen/U.S. Air Force/Flickr, CC BY 2.0)

CHAPTER OUTLINE

- 24.1 Culturally Responsive Care
- 24.2 Health Care Tools to Identify Organizational Strengths and Areas for Improvement
- 24.3 The Nurse's Role in Promoting Organizational Cultural and Linguistic Competency

INTRODUCTION Hyeon Lee, a 68-year-old Korean immigrant, has been recently discharged from the hospital after being treated for pneumonia. She lives with her daughter, Nari, who is fluent in English and initially offers to interpret for her mother. However, Emily, the home care nurse, recognizes that using a family member as an interpreter, although well-intentioned, is not considered best practice due to potential misunderstandings and biases. How might Emily explain this to Hyeon's daughter? What does the nurse need to consider to provide culturally and linguistically appropriate care? In an increasingly globalized world, community nurses often find themselves caring for clients from diverse cultural and linguistic backgrounds. The ability to deliver health care that is attuned to these unique aspects of client identity is an essential component of modern, client-centered care.

This chapter provides an in-depth exploration of culturally and linguistically appropriate care, using the clinical scenario of Hyeon as a case study. Hyeon's situation—a recent immigrant discharged from the hospital while navigating cultural and language barriers—is a good example of the challenges many clients and health care providers face in today's diverse communities.

24.1 Culturally Responsive Care

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 24.1.1 Define culturally responsive care versus cultural competence.
- 24.1.2 Discuss the National Standards for Culturally and Linguistically Appropriate Services in Health and Health Care.
- 24.1.3 Identify the characteristics of a culturally and linguistically competent organization.
- 24.1.4 Evaluate an organization's structure, mission, vision, philosophy, and values to assess cultural and linguistic competency.

Cultural diversity can pose significant challenges for the successful implementation of community health programs and services. As culturally and linguistically diverse populations continue to grow, health care professionals are increasingly recognizing the need for culturally tailored approaches that can improve outcomes, streamline processes, and enhance client satisfaction. This shift in perspective reflects a broader recognition of the importance of ensuring that health services are delivered in a way that is respectful, responsive, and appropriate to the unique needs and perspectives of each client.

As discussed in [Culturally and Linguistically Responsive Nursing Care](#), to improve health outcomes, nurses need to provide clients with care that is consistent with their values, beliefs, worldviews, and practices (Marion et al., 2016). Cultural competence, defined as the process of developing “the ability to recognize and navigate differences in cultural attitudes, beliefs, and values in order to provide equitable and effective health care to all clients” (Betancourt et al., 2003, p. 1), is one component of culturally congruent care. These concepts are crucial aspects of health care service delivery that require health care professionals to have an understanding and appreciation of diverse cultural backgrounds. In March 2001, the U.S. Department of Health and Human Services (HHS) and the Office of Minority Health released standards for culturally and linguistically appropriate services (CLAS) in health care (Federal Register, 2013) (see [Table 24.1](#)). The office revised and republished the standards in 2013, making them a comprehensive and nationally recognized guide for cultural and linguistic competence in health care (HHS, 2013). The National CLAS Standards provide a blueprint for health and human services organizations to ensure that culturally and linguistically appropriate services promote a more inclusive definition of culture that is sensitive to the unique aspects of race, ethnicity, and language, as well as sexual orientation and gender identity (HHS, n.d.-a).

Standard	Description
Principle Standard	<ul style="list-style-type: none"> • Provide effective, equitable, understandable, and respectful quality care and services that are responsive to diverse cultural health beliefs and practices, preferred languages, health literacy, and other communication needs.
Governance, Leadership, and Workforce	<ul style="list-style-type: none"> • Advance and sustain organizational governance and leadership that promotes CLAS and health equity through policy, practices, and allocated resources. • Recruit, promote, and support culturally and linguistically diverse governance, leadership, and workforce that are responsive to the population in the service area. • Educate and train governance, leadership, and workforce in culturally and linguistically appropriate policies and practices on an ongoing basis.

TABLE 24.1 Culturally and Linguistically Appropriate Services Standards (See HHS, n.d.-a.)

Standard	Description
Communication and Language Assistance	<ul style="list-style-type: none"> • Offer language assistance to individuals who have limited English proficiency and/or other communication needs, at no cost to them, to facilitate timely access to all health care and services. • Inform all individuals of the availability of language assistance services clearly and in their preferred language, verbally and in writing. • Ensure the competence of individuals providing language assistance; the use of untrained individuals and/or minors as interpreters should be avoided. • Provide easy-to-understand print and multimedia materials and signage in the languages commonly used by the populations in the service area.
Engagement, Continuous Improvement, and Accountability	<ul style="list-style-type: none"> • Establish culturally and linguistically appropriate goals, policies, and management accountability, and infuse them throughout the organization's planning and operations. • Conduct ongoing assessments of the organization's CLAS-related activities and integrate CLAS-related measures into measurement and continuous quality improvement activities. • Collect and maintain accurate demographic data to monitor and evaluate the impact of CLAS on health equity and outcomes and to inform service delivery. • Conduct regular assessments of community health assets and needs and use the results to plan and implement services that respond to the cultural and linguistic diversity of populations in the service area. • Partner with the community to design, implement, and evaluate policies, practices, and services to ensure cultural and linguistic appropriateness. • Create conflict and grievance resolution processes that are culturally and linguistically appropriate to identify, prevent, and resolve conflicts or complaints. • Communicate the organization's progress in implementing and sustaining CLAS to all community partners, constituents, and the general public.

TABLE 24.1 Culturally and Linguistically Appropriate Services Standards (See HHS, n.d.-a.)

As [Culturally and Linguistically Responsive Nursing Care](#) notes, recent critiques of cultural competence contend that it is based on ethnocentrism, a belief that one's own cultural values, traditions, and practices are superior to those of other cultures (Beser et al., 2021). According to this critique, the ethnocentric orientation of cultural competence can lead to stereotyping and, as a result, perpetuate already existing biases and inequities (Berger & Ribeiro Miller, 2021). Other critics argue that the process of developing cultural competence oversimplifies the complex nature of culture, reducing it to facts and easily acquired knowledge while failing to consider cultural change and variability (Campinha-Bacote, 2018). As such, a recent shift toward culturally responsive care focuses on nurses' ability to recognize and respond inclusively to diverse perspectives, and it emphasizes the importance of social justice (Day & Beard, 2019). These critiques underscore the importance of cultural humility, self-reflection, and committing to a client-centered nursing practice.

By prioritizing culturally responsive care, nurses and other health care professionals can ensure that all individuals, regardless of their cultural background, receive equitable and effective care. One example of culturally responsive care in nursing is the ability to effectively communicate with clients from diverse cultural backgrounds. This may involve using interpreters or language services, when necessary, but also involves being aware of potential communication barriers such as differences in language, nonverbal communication, and health literacy levels. Culturally responsive nurses also actively listen to their clients, seek to understand their cultural beliefs and practices, and incorporate this knowledge into their care plans. For example, a nurse may modify a client's care plan to accommodate cultural food preferences while in relation to dietary restrictions into the client's treatment. By demonstrating cultural competence in their practice, nurses can build trust and rapport with their clients and improve their overall health outcomes.

Additionally, the lesbian, gay, bisexual, transgender, queer/questioning, and asexual/aromantic/agender plus other unknowns (LGBTQIA+) community consists of a cross-cultural broad range of community members and individuals

of all races, ethnic and religious backgrounds, and socioeconomic statuses. The health care needs of the LGBTQIA+ community should be considered to provide the best care and avoid inequalities of care. Culturally competent care of a member of this community includes the following:

- Care that targets a specific population
- Social and structural equality of care
- Avoidance of discrimination and stigmatization

Importantly, when providing care to LGBTQIA+ clients, nurses should keep in mind that members of socially marginalized groups may present with mistrust and fear of the health care system (Damaskos et al., 2018).

Culturally sensitive, holistic care is based on treating the client as a whole person while conducting comprehensive assessments that are sensitive to race/ethnicity, social class, sexual orientation, and gender identity, as well as the individual's past interactions with the health care system.

National Standards for Culturally and Linguistically Appropriate Services

Before the development of the CLAS standards, national organizations and federal agencies had varying ideas about what constituted culturally appropriate health care. As a result, health care professionals were often left with a wide spectrum of ideas and policies to choose from. However, the CLAS standards provide a cohesive and standardized framework for health care professionals to follow, ensuring that they provide culturally appropriate services for every client (see [Table 24.1](#)).

Nurses incorporate the CLAS standards into their daily work by providing language assistance services to clients who have limited English proficiency. This language assistance may involve using a **professional medical interpreter** or a **qualified bilingual staff member** to facilitate communication between the nurse and the client. The nurse also uses plain language and avoids medical jargon to ensure that the client understands their condition, treatment plan, and medications. Additionally, this nurse may incorporate cultural beliefs and practices into the client's care plan. For example, if a client prefers traditional remedies or therapies, the nurse may work with the client to find ways to incorporate these practices into the client's treatment plan. The nurse may also be sensitive to clients' cultural or religious beliefs when providing care, such as accommodating dietary restrictions or scheduling procedures around prayer times.

A culturally responsive nurse is aware of the importance of health literacy and provides client education materials in a way that is accessible and understandable to clients with varying levels of health literacy. This may involve using visual aids, interactive tools, or other methods to help clients understand their condition and treatment plan. Additionally, learning to take care of members of the LGBTQIA+ community involves understanding multiple special considerations and avoiding unconscious and perceived biases. Members of the LGBTQIA+ community have unfortunately experienced a challenging history, but with education, health professionals can learn to provide compassionate, comprehensive, and high-quality care. By incorporating CLAS standards into their daily work, nurses can improve client outcomes and promote health equity for all individuals, regardless of their cultural background. A study by Beach et al. (2020) found that the implementation of CLAS standards in a primary care setting led to improved client-provider communication, increased client trust, and better client engagement.

CASE REFLECTION

Providing Linguistically Appropriate Care

Read the scenario, and then respond to the questions that follow.

Hyeon Lee, a 68-year-old Korean immigrant, has been recently discharged from the hospital after being treated for pneumonia. She lives with her daughter, Nari, who is fluent in English and initially offers to interpret for her mother. However, Emily, the home care nurse, recognizes that using a family member as an interpreter, although well-intentioned, is not considered best practice due to potential misunderstandings and biases.

Emily listens respectfully to Nari's offer to translate for her mother, Hyeon. Emily then tactfully explains the importance of using a professional medical interpreter to ensure accurate communication while still involving Nari in her mother's care. Emily arranges for a Korean-speaking medical interpreter to facilitate communication and

ensures that written materials, such as medication instructions, are provided in Korean.

1. What were some potential negative consequences of relying solely on Nari to translate for Hyeon, and how did Emily address these concerns while still involving Nari in her mother's care?
2. How did Emily's actions to arrange for a Korean-speaking medical interpreter and provide written materials in Korean align with the CLAS standards, and how did these actions impact Hyeon's care experience?
3. How did Emily's interactions with Nari and Hyeon demonstrate awareness and respect for cultural differences?

ASSESSING HEALTH LITERACY

Determining health literacy in culturally diverse clients can be a complex process, as it requires understanding not only the client's level of literacy but also their cultural background and experiences. Here are some strategies nurses can use to assess health literacy in culturally diverse clients:

- Use validated health literacy assessments: The National Library of Medicine in cooperation with Boston University and CommunicateHealth keeps a database of these tools ([Health Literacy Tool Shed](https://openstax.org/r/healthliteracybu) (<https://openstax.org/r/healthliteracybu>)). These assessments can be administered orally, in writing, or through visual cues and can be translated into different languages and adapted to different cultures.
- Use plain language: Nurses can use plain language and avoid medical jargon when communicating with clients. This can help ensure that clients understand their health information and can make informed decisions about their care.
- Observe client behavior: Nurses can observe client behavior to assess their level of health literacy. For example, if a client appears confused and/or asks many questions, this may indicate that they have limited health literacy.
- Assess numeracy skills: Numeracy skills are an important component of health literacy. Health care providers can assess a client's numeracy skills by asking them to perform tasks such as calculating dosages of medication or understanding nutritional labels.
- Assess cultural beliefs: Cultural beliefs can impact health literacy and health care decision-making. Health care providers can assess a client's cultural beliefs and practices to better understand how these factors may impact their health literacy.

By using a combination of these strategies, health care providers can better understand their clients' health literacy levels and develop interventions to improve health outcomes for culturally diverse populations.

(See HHS, 2010; Nutbeam & Lloyd, 2021.)

CLAS standards provide a framework for achieving effective, culturally responsive, and linguistically appropriate care for clients from diverse backgrounds. Language access services aim to ensure that clients with **limited English proficiency** (LEP) can access health care services and receive quality care without language barriers. The CLAS standards recommend several strategies to improve language access services, including offering interpretation services, translation of vital documents, and training of staff in cultural and linguistic competency. The provision of language assistance is a requirement for all health care providers that receive federal funding, under Title VI of the Civil Rights Act of 1964 (HHS, n.d.-b).

Research has demonstrated the importance of language access services in improving health care outcomes for clients with LEP. A study by Schwei et al. (2019) found that the use of professional interpreters improved the quality of care for clients with LEP, increased client satisfaction, and reduced medical errors. Additionally, Ngo-Metzger et al. (2007) found that clients with LEP who received language assistance were more likely to receive preventive services and had better health outcomes than those who did not receive language assistance.

Characteristics of a Culturally and Linguistically Responsive Organization

Culturally and linguistically responsive organizations should provide readily available, culturally appropriate oral and written language services to LEP members through such means as bilingual/bicultural staff, trained medical interpreters, and qualified translators ([Figure 24.2](#)). Additionally, such organizations should be aware of and address

the different barriers faced by culturally and linguistically diverse clients such as language barriers, legal restrictions, or differences in health beliefs, and they should have the ability to recognize the importance of race, ethnicity, and culture in health care (Handtke et al., 2019).

FIGURE 24.2 Culturally and linguistically responsive organizations ensure printed client educational materials are appropriate for the needs of the populations they serve. (credit: U.S. Department of Agriculture/Flickr, Public Domain)

An Agency for Healthcare Research and Quality (AHRQ) report also highlights the importance of providing culturally and linguistically appropriate care to diverse groups and individuals, including those with LEP. The AHRQ report (2019) states that culturally competent organizations should strive to provide adequate access to high-quality health care, provide improved health outcomes for diverse populations, and eliminate disparities in health care.

Culturally responsive organizations can recognize and respect differences in culture, understand and manage the dynamics of cross-cultural interactions, and adapt to the needs of diverse populations ([Table 24.2](#)). Such organizations should be able to provide **cultural safety**, which is defined as an environment that is spiritually, socially, and emotionally safe, as well as physically safe for people, “where there is no assault, challenge or denial of their identity, of who they are and what they need” (Williams, 1999, p. 213). Overall, a culturally and linguistically responsive organization is one that provides culturally appropriate care, recognizes and addresses the barriers faced by diverse populations, works to eliminate health care disparities, and creates an environment that is safe and respectful of diverse cultures and identities.

Characteristic	Explanation	Examples
Diverse workforce	The organization should strive to recruit and retain a diverse workforce that reflects the cultural and linguistic diversity of its client population.	The clinic actively recruits and retains a diverse workforce that reflects the cultural and linguistic diversity of its client population. It ensures that there is adequate representation of staff from different ethnic and language backgrounds to enhance communication and cultural understanding.
Language services	The organization should provide professional and certified language services, such as interpreters and translators, to support effective communication between clients and health care providers.	The clinic has trained interpreters available in-person, over the phone, or through telehealth services, based on the client's preference and needs.
Cultural awareness and sensitivity	The organization should provide cultural competence training to its staff to improve their understanding of cultural differences and to promote respectful and effective communication with clients from diverse backgrounds.	A state department of health offers free cultural competency training for participating providers to help them develop knowledge and skills to deliver client-centered care that respects their clients' cultural and linguistic needs and preferences.
Client-centered care	The organization should prioritize client-centered care that considers the cultural and linguistic needs and preferences of its clients.	Inclusive communication with LGBTQIA+ clients is essential for providing culturally competent care. Using inclusive language is one way to create a welcoming and affirming environment. For instance, health care providers should use gender-neutral terms like "partner" instead of assuming a client's marital status or using gender-specific language like "husband" or "wife." It is also important to ask clients about their preferred name and pronouns to ensure respectful and accurate communication.
Culturally appropriate policies and procedures	The organization should establish policies and procedures that are culturally appropriate and responsive, such as policies for providing language services and assessing clients' cultural and linguistic needs.	The primary care clinic has guidelines for providing language services, conducting cultural assessments to identify client needs, and ensuring that culturally appropriate materials, resources, and signage are available throughout the clinic.

TABLE 24.2 Characteristics of a Culturally and Linguistically Responsive Organization (See Handtke et al., 2019; Tellez & the Institute for Economic and Racial Equity, Brandeis University, 2015.)

Characteristic	Explanation	Examples
Community engagement	The organization should engage with the local community to better understand the cultural and linguistic needs of its client population and to build trust and rapport with clients and their families.	Recognizing the importance of engaging with the local community, the primary care clinic actively seeks feedback, collaborates with community organizations, and conducts community needs assessments to better understand the cultural and linguistic needs of its client population. This helps to build trust and rapport with clients and their families and ensures that services are tailored to their specific needs.
Ongoing evaluation and assessment	The organization should regularly monitor and evaluate its services for effectiveness and make changes as needed to improve cultural and linguistic competence.	A clinic regularly evaluates the effectiveness of its practices by collecting feedback from clients on the services it offers, tracking health outcomes, and making necessary changes to continuously improve the delivery of care.
Commitment to diversity and inclusion	The organization should have a mission, a vision, a philosophy, and values committed to cultural and linguistic competence, diversity, and inclusion.	An example of a vision that communicates a commitment to culturally and linguistically responsive care is: Our vision is to create a health care environment where cultural and linguistic diversity are celebrated and embraced. We strive to be an organization that promotes inclusivity, respects individual differences, and provides the highest standard of care to all individuals, regardless of their cultural or linguistic background.

TABLE 24.2 Characteristics of a Culturally and Linguistically Responsive Organization (See Handtke et al., 2019; Tellez & the Institute for Economic and Racial Equity, Brandeis University, 2015.)

Organizational Evaluation of Cultural and Linguistic Effectiveness

Culturally effective organizations enable, cultivate, and support the delivery of high-quality health care for all groups of people (Tellez, T., & the Institute for Economic and Racial Equity, Brandeis University, 2015). When evaluating an organization's structure, mission, vision, philosophy, and values to assess cultural and linguistic effectiveness, it is important to consider several key factors (see [Figure 24.3](#)).

The CLAS standards highlight the significance of integrating culturally and linguistically appropriate goals, policies, and management accountability into an organization's planning and operations. To achieve this, organizations should conduct ongoing assessments of their CLAS-related activities and integrate CLAS-related measures into measurement and continuous quality improvement activities. The CLAS standards also direct organizations to provide communication and language assistance to individuals with LEP and ensure that their workforce is trained and educated in culturally and linguistically appropriate services.

FIGURE 24.3 Culturally effective health care organizations know that ongoing assessments and continuous process improvement during planning and operations are needed to improve quality of care, safety, and client satisfaction. (See Tellez, T., & the Institute for Economic and Racial Equity, Brandeis University, 2015; attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

Additionally, the National Center for Cultural Competence (NCCC) at Georgetown University ([NCCC](https://openstax.org/r/ncccgeorgetown) (<https://openstax.org/r/ncccgeorgetown>)) identified six compelling reasons that health care organizations across the United States are making cultural effectiveness a priority (n.d.):

- To improve service quality and health outcomes
- To gain a competitive edge in the marketplace
- To respond to current/projected demographic changes
- To eliminate longstanding health disparities
- To meet legal, regulatory, and accreditation mandates
- To decrease the likelihood of malpractice claims

By taking steps to achieve culturally congruent care, organizations can align themselves with new industry standards and regulations. For instance, accrediting bodies like The Joint Commission (2023) now require an organizational focus on culturally appropriate care. Newer payment models incentivize health care providers to deliver culturally competent care, as it has been shown to improve client satisfaction and other outcomes. As a result, organizations that successfully implement culturally competent care can potentially increase their revenue.

Organizational Supports for Cultural Competence

Organizational supports play a critical role in enhancing cultural competence among health care providers, ultimately improving health outcomes for clients from diverse backgrounds. Lekas and colleagues (2020) note that organizational supports for cultural competence include leadership commitment, **workforce diversity**, cultural competence training, defined set of values and principles, client-centered care, and **community engagement**. Here are several examples of organizational supports for cultural competence:

- **Leadership commitment:** Leadership commitment refers to the active involvement and support of organizational leadership in promoting cultural competence. This includes developing and implementing policies and practices that prioritize cultural competence and diversity, allocating resources to cultural competence initiatives, and holding staff accountable for meeting cultural competence goals.
- **Workforce diversity:** One essential principle of cultural competence is valuing diversity, which means accepting and respecting differences between and within cultures. Organizations can demonstrate this by

- promoting diversity and inclusivity in their hiring practices and encouraging employees to participate in cultural competence training.
- **Cultural competence training:** Cultural competence training involves providing staff with the knowledge, skills, and attitudes necessary to provide culturally appropriate care. This includes training on cultural beliefs and practices, on communication skills, and on strategies for addressing cultural barriers to care.
 - **Defined set of values and principles:** Cultural competence requires that organizations have a defined set of values and principles that enable them to work effectively cross-culturally. This includes demonstrating behaviors, attitudes, policies, and structures that support cultural competence. Organizations can achieve this by developing a formal policy statement, providing cultural competence training, and regularly assessing their progress in meeting cultural competence goals.
 - **Client-centered care:** A culturally competent health care organization recognizes the importance of culture in delivering client care and focuses on reducing disparities in health care due to race, ethnicity, culture, gender, economic status, and other factors. To achieve this, organizations can develop client-centered care strategies that incorporate cultural beliefs and values, provide interpreter services, and use culturally appropriate materials in client education and outreach.
 - **Community engagement:** Community engagement involves collaborating with community organizations and partners to develop culturally appropriate services and programs. This includes conducting outreach to underserved communities, partnering with community organizations to provide education and support, and involving clients and families in the design and implementation of cultural competence initiatives. See [Assessment, Analysis, and Diagnosis](#) for more information on performing a community health assessment.

24.2 Health Care Tools to Identify Organizational Strengths and Areas for Improvement

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 24.2.1 Describe the Promoting Cultural and Linguistic Competency Self-Assessment Checklist for Personnel Providing Primary Health Care Services.
- 24.2.2 Identify the components of the ACCESS model.
- 24.2.3 Use the ACCESS model as a framework to deliver transcultural nursing care.

There are a range of tools and strategies, including cultural competency self-assessments, communication, and interventions such as the ACCESS model, all aimed at identifying strengths and pinpointing areas where improvements can be made. By focusing on these aspects, nursing professionals and health care organizations can create an environment where all clients, regardless of their cultural or linguistic background, feel understood, respected, and well cared for.

Promoting Cultural and Linguistic Competency Self-Assessment Checklist

The Promoting Cultural and Linguistic Competency Self-Assessment Checklist for Personnel Providing Primary Health Care Services is a useful resource for improving cultural and linguistic competency in health care settings. It is designed to enhance awareness of and sensitivity to cultural and linguistic diversity and to provide examples of practices that foster an environment of cultural and linguistic competence. Developed by the National Center for Cultural Competence ([NCCC \(<https://openstax.org/r/ncccgeorgetown>\)](https://openstax.org/r/ncccgeorgetown) at Georgetown University, the checklist is intended for use by health care personnel in primary care settings (n.d.) and consists of six sections:

- Creating a welcoming environment
- Communicating effectively across cultures
- Conducting a cultural self-assessment
- Understanding and applying cultural knowledge
- Engaging in cross-cultural interactions
- Advocating for culturally and linguistically competent practices

Each section is designed to help health care personnel assess their level of cultural and linguistic competence and identify areas for improvement. The checklist provides a list of items to consider and offers examples of best practices for each section. By completing the checklist, health care personnel can gain a better understanding of

their cultural and linguistic competencies and take steps to improve the care they provide to clients from diverse backgrounds. For example, in the section on communicating effectively across cultures, the checklist suggests using plain language, avoiding medical jargon, and utilizing an interpreter when necessary.

According to the NCCC, the checklist has been widely used in health care settings and has been shown to be effective in improving cultural and linguistic competence among health care personnel (n.d.).

PROMOTING CULTURAL AND LINGUISTIC COMPETENCY SELF-ASSESSMENT CHECKLIST

Visit this [link](https://openstax.org/r/georgetownedu) (<https://openstax.org/r/georgetownedu>) to the National Center for Cultural Competence checklist, complete a self-assessment, and then respond to the following questions.

1. How has this self-assessment influenced your understanding of cultural differences? Can you identify any specific insights you gained?
2. What additional tools or resources do you think could complement this assessment?
3. Have you uncovered any preconceptions or biases that you were previously unaware of? How will you address these in your professional development?
4. In what ways have you identified areas for personal growth regarding cultural and linguistic competency? What steps do you plan to take to improve in these areas?

Creating a Welcoming Environment

A welcoming environment in health care refers to a setting that is inclusive, respectful, and culturally sensitive to clients from diverse backgrounds. Such an environment promotes client-centered care and is culturally responsive to clients' diverse needs—a place where clients feel respected, valued, and included, regardless of their cultural or linguistic backgrounds. By creating a welcoming environment, health care workers can improve the quality of care and promote positive health outcomes for all clients (Figure 24.4). Creating a welcoming environment is part of the NCCC checklist (NCCC, 2013); the following list presents examples of how this may be accomplished:

- Introducing oneself and asking how the client prefers to be addressed, including name and pronouns
- Using professional interpreters or language services to communicate effectively with clients who have LEP or speak a different language
- Displaying posters, brochures, and other materials that represent the diversity of the client population
- Providing information about the client's rights and responsibilities in multiple languages and formats
- Asking about the client's cultural beliefs, practices, and values related to health and illness
- Providing accommodations that meet the client's specific cultural and linguistic needs, such as dietary restrictions or prayer times
- Avoiding assumptions or stereotypes based on the client's race, ethnicity, or cultural background
- Being aware of one's own cultural biases and seeking to understand the client's perspective
- Creating a safe and supportive environment that promotes trust and open communication between the client and health care provider
- Assessing if the physical environment is welcoming and accessible to all clients, including those with disabilities

FIGURE 24.4 Making clients feel comfortable and welcome goes a long way toward improving health outcomes. In this photo, Ensign Chaquel Shiver places a client at ease while checking them into a Navy hospital ship in Riohacha, Colombia. (credit: "Sailor gives a patient a thumbs-up while checking him" by Kris R. Lindstrom/U.S. Navy/Flickr, CC BY 2.0)

The following is an example of a welcoming environment: The waiting room in a clinic has accessible seating for clients with mobility impairments and clear signage—including signage in Braille—that indicates accessible routes throughout the facility. Clinic staff has received training on how to interact with clients with disabilities in a respectful and inclusive manner. Providing accessible seating, clear signage, and staff training can help create a welcoming environment that is inclusive of all clients, regardless of their physical abilities. By assessing accessibility, health care personnel can identify areas for improvement and take steps to fix them.

LGBTQIA+ PEOPLE TALK ABOUT THEIR EXPERIENCES ACCESSING HEALTH CARE

[Access multimedia content \(<https://openstax.org/books/population-health/pages/24-2-health-care-tools-to-identify-organizational-strengths-and-areas-for-improvement>\)](https://openstax.org/books/population-health/pages/24-2-health-care-tools-to-identify-organizational-strengths-and-areas-for-improvement)

In this video from North Western Melbourne Primary Health Network based in Melbourne, Australia, LGBTQIA+ people talk about their experiences accessing health care and offer suggestions to help health care professionals improve their communications and interactions with this population. Although the clients in the video are Australian, much of their comments apply to health care in the United States.

Watch the video, and then respond to the following questions.

1. What are some reasons individuals who identify as a member of a LGBTQIA+ group, including transgender people, might not be accessing health care?
2. When a health care professional misgenders a client, what does it communicate to that client?
3. As a nurse, how can you create a welcoming environment for transgender clients?
4. What trainings do you think would help nurses provide culturally safe care to LGBTQIA+ clients?

For more information on nursing advocacy for LGBTQIA+ populations, read [Nursing Advocacy for LGBTQ+ Populations \(<https://openstax.org/r/nursingworldglobalassets>\)](https://openstax.org/r/nursingworldglobalassets) from the American Nurses Association.

Communicating Effectively Across Cultures

Trust provides the foundation for effective communication with clients. Building trust is essential because it lays the groundwork for a strong therapeutic relationship between health care providers and their clients from different backgrounds. When clients trust their health care providers, they are more likely to openly share their concerns, beliefs, and preferences, which enhances diagnostic accuracy and treatment planning. In a culturally diverse health

care setting, trust helps overcome potential language and cultural barriers that may otherwise hinder effective communication. By fostering trust, nurses can create an environment where clients feel safe, respected, and valued. Additionally, trust plays a significant role in ensuring client compliance and adherence to treatment plans. Clients are more likely to follow treatment recommendations from health care providers they trust, leading to improved health outcomes.

To build trust, nurses need to demonstrate cultural humility, which involves acknowledging their own biases, being open to learning about different cultures, and actively engaging in respectful and nonjudgmental communication. Nurses should prioritize active listening, empathy, and validating clients' experiences and perspectives. Additionally, they should be sensitive to cultural differences in communication styles, nonverbal cues, and health beliefs and adapt their approach accordingly. See [Culturally and Linguistically Responsive Nursing Care](#) for more information.

Effective communication across cultures is a cornerstone of inclusive and compassionate nursing care, encompassing differences not only in ethnicity and language but also in sexual orientation, gender identity, and relationships. For example, recognizing and respecting the unique needs of LGBTQIA+ individuals is vital in fostering trust and understanding. One tangible step is to include nonbinary choices on intake forms, allowing clients to identify themselves in a way that feels most authentic. This sends a strong message of acceptance and can significantly impact the client's comfort and willingness to engage in care. Additionally, environmental factors such as displaying LGBTQIA+ inclusive symbols, offering gender-neutral restrooms, and displaying inclusive signage can further promote an inclusive atmosphere. Collaborating with LGBTQIA+ advocacy groups and implementing these best practices can help ensure that health care providers are meeting the diverse needs of all clients, demonstrating a commitment to care that respects and honors individual identity and cultural background.

In many cultures, concepts of health and illness are deeply connected to spiritual or religious beliefs. For example, some clients may believe that an illness is caused by a lack of balance between the body, mind, and spirit. To communicate effectively with these clients, health care providers can ask about their spiritual or religious beliefs and how they relate to their health. They can also provide information about spiritual or religious resources that may be available, such as chaplains, clergy, or prayer groups.

Another example of effective communication across cultures is the use of professional interpreters or language services. Clients who have LEP or speak a different language may struggle to communicate their health concerns or understand medical instructions. By using interpreters or language services, health care providers can ensure that clients receive accurate and appropriate care. Interpreters can also help health care providers to understand cultural nuances and provide culturally responsive care.

Finally, health care providers can use visual aids or other materials to communicate effectively with clients from diverse cultural backgrounds. For example, providing information in multiple languages or using pictures or diagrams to explain medical procedures can help to overcome language and cultural barriers. Health care providers can also use **cultural brokers** or community health workers to help clients navigate the health care system and understand their health needs. Cultural brokers are individuals who act as intermediaries or go-betweens among different cultures. They use their knowledge and understanding of different cultures to help facilitate communication, understanding, and advocacy on behalf of an individual or group. The concept of cultural brokering has evolved and permeated many aspects of U.S. society, including health care, education, and child welfare programs. Cultural brokers can come from various backgrounds and may receive extensive training in cultural humility and community partnerships to better serve their role.

BEING A “CULTURAL BROKER”

[Access multimedia content \(<https://openstax.org/books/population-health/pages/24-2-health-care-tools-to-identify-organizational-strengths-and-areas-for-improvement>\)](https://openstax.org/books/population-health/pages/24-2-health-care-tools-to-identify-organizational-strengths-and-areas-for-improvement)

Cultural brokers play an indispensable role in bridging the gap between different cultures, especially in diverse settings like health care, education, and community services. Acting as intermediaries, they facilitate communication and understanding by interpreting cultural norms, values, and languages, ensuring that individuals from various backgrounds can effectively interact and collaborate. This video explores the vital function of cultural brokers, their skills, and the impact they have on creating more inclusive and empathetic environments.

Watch the video, and then respond to the following questions.

1. How would you define the role of a cultural broker?
2. How does this role contribute to effective communication between different cultural backgrounds?
3. Can you think of a situation in your own life where a cultural broker might have been helpful? How might the outcome have been different with a cultural broker involved?

Effective communication with individuals from diverse backgrounds is critical in health care settings. Research has shown that culture is central to effective messaging for community engagement in health care and that cultural respect is critical for accuracy in medical research (Tse et al., 2020). Interprofessional collaboration—actively partnering with professionals from diverse backgrounds with distinctive professional cultures—is also essential for meeting the needs of diverse populations in health care settings (Kline et al., 2019).

CONVERSATIONS ABOUT CULTURE

Culture, Language, and Health Literacy

[Access multimedia content \(<https://openstax.org/books/population-health/pages/24-2-health-care-tools-to-identify-organizational-strengths-and-areas-for-improvement>\)](https://openstax.org/books/population-health/pages/24-2-health-care-tools-to-identify-organizational-strengths-and-areas-for-improvement)

To improve individual health and build healthy communities, nurses and other health care providers need to recognize and address the unique culture, language, and health literacy of diverse consumers and communities as presented in this Health Resources and Services Administration video.

Watch the video, and then respond to the following questions.

1. Why is effective communication as important to health care as clinical skills?
2. How does cultural competence contribute to health equity?

Conducting a Cultural Self-Assessment

Organizations and nurses working in the field of population health are uniquely positioned to understand and meet the diverse cultural needs of the communities they serve. Assessment tools are available to evaluate and enhance the cultural competence of nurses and their practice. For example, diversity, equity, and inclusion (DEI) organizational assessment tools can be utilized as a benchmark, specifically tailored for nursing environments, to guide quality improvement and recognize cultural competence as an ongoing, adaptive process. As introduced previously, institutions like Georgetown University's NCCC also offer tools such as the Cultural and Linguistic Competence Health Practitioner Assessment (CLCHPA), designed to assess nurses' cultural awareness and responsiveness. Additionally, frameworks like "Becoming a Culturally Competent Nurse in Population Health" provide guidelines and strategies for nursing professionals to develop, implement, and sustain culturally competent care within their practice. These resources emphasize the essential role nurses play in delivering care that is not only clinically effective but also culturally sensitive, ultimately contributing to the overall well-being and health of diverse populations.

Although the [CLCHPA \(<https://openstax.org/r/clchpa>\)](https://openstax.org/r/clchpa) is an individual assessment for health practitioners, having culturally competent providers within an organization enhances the organization's cultural competence as a whole. The CCHPA is based on three assumptions: (1) cultural competence is a developmental process at both the individual and organizational levels; (2) with appropriate support, individuals can enhance their cultural awareness, knowledge, and skills over time; and (3) cultural strengths exist within organizations or networks of professionals but often go unnoticed and untapped (NCCC, 2006).

The CLCHPA has six subscales:

- Values and Belief Systems
- Cultural Aspects of Epidemiology
- Clinical Decision-Making
- Life Cycle Events
- Cross-Cultural Communication

- Empowerment/Health Management

The NCCC believes that self-assessment is a process based on an organization's strengths. Upon completion of the CLCHPA, response fields identify awareness, knowledge, or skill level for each of the six subscales. Depending on the response pattern, a listing of resources such as web-based journals, textbooks, multimedia materials, and suggested learning experiences should be provided.

Understanding and Applying Cultural Knowledge

To apply cultural knowledge, health care providers should use culturally competent communication skills to understand their clients' cultural backgrounds and how that might affect their health beliefs, behaviors, and preferences. According to Campinha-Bacote (2002), culturally competent communication involves being aware of one's own cultural biases and assumptions—using appropriate language and nonverbal communication—and actively listening to clients to understand their unique perspectives. Providers can tailor their care to meet the individual needs of each client.

Health care providers should also be aware of the impact of organizational culture on health care quality. Health care organizations with a strong culture of safety and quality are more likely to provide high-quality care and improve client outcomes. Providers can use their knowledge of organizational culture to identify areas for improvement and drive change within their organizations to improve quality and eliminate health care disparities. Applying cultural knowledge in health care involves understanding and respecting the cultural beliefs and values of individual clients while also recognizing the impact of organizational culture on health care quality. By doing so, nurses can improve client outcomes and provide more equitable care to all clients.

CASE REFLECTION

Applying Cultural Knowledge

Read the scenario, and then respond to the questions that follow.

This scenario continues to follow Emily's work with Hyeon Lee. After completing a cultural assessment with Hyeon, Emily takes time to understand Korean cultural norms and beliefs that may influence Hyeon's care and maintains respect for her preferences, including modesty during physical assessments. With Hyeon's permission, Emily actively involves members of the family, such as Nari, in Hyeon's care plan and connects her client with local Korean community centers that may provide support. Emily gives careful attention to explaining Hyeon's medication regimen, utilizing visual aids when necessary.

1. How did Emily's actions in understanding Korean cultural norms and beliefs align with the CLAS standards for culturally responsive care?
 2. Why is it beneficial to actively involve family members, like Nari, in the care plan of a client from a different cultural background? How does this contribute to providing culturally responsive care?
 3. Discuss the importance of maintaining respect for client preferences, such as modesty, during physical assessments when providing culturally responsive care.
-

Advocating for Culturally and Linguistically Responsive Practices

Health care organizations can advocate for culturally and linguistically responsive practices by implementing policies and procedures that prioritize DEI. Here are some specific ways that health care organizations can advocate for culturally and linguistically responsive practices:

- Provide training and education to nurses and other health care providers: Health care organizations can provide cultural competency training and education to their staff to increase their understanding of different cultures, values, beliefs, and practices. This can include training on how to communicate effectively with clients who have LEP, as well as education on cultural diversity and sensitivity.
- Use interpreters: Health care organizations can ensure that clients with LEP have access to qualified interpreters. This can include in-person interpreters, telephone interpreters, or video interpreters, depending on the needs of the client.
- Use translated materials: Health care organizations can provide translated materials in languages commonly

spoken by the client population they serve. This can include client education materials, consent forms, and other important documents.

- Engage with community organizations: Health care organizations can partner with community organizations to better understand the health care needs of their client population. This can include collaborating with community leaders to develop culturally appropriate outreach and education programs.
- Collect and analyze data: Health care organizations can collect and analyze data on the cultural and linguistic needs of their client population. This can help identify areas where improvements can be made and inform targeted interventions to address disparities.

By implementing these strategies, health care organizations can advocate for culturally and linguistically sensitive practices and improve health outcomes for all clients, regardless of their background or language proficiency.

THE ROOTS OF HEALTH INEQUITIES

The Cultural Roots of Health Inequities

Cultural behaviors have been shown to have important implications for human health. Culture—a socially transmitted system of shared knowledge, beliefs, and practices that varies across groups—has been a critical mode of adaptation throughout the history of our species. Socioeconomic status, gender, religion, and moral beliefs are among the cultural factors that have been shown to affect health outcomes.

Racial and cultural minority groups have documented disparities across a number of health indicators, including Black Americans, Native Americans, and Latino Americans. Some evidence suggests that particular groups may receive poorer standards of care due to biased beliefs or attitudes held by health professionals.

Researchers have also found a clear pattern of disparities in health, which was first observed in the 1970s. These disparities are attributed to a range of factors, including cultural and social determinants, access to care, and individual behaviors.

Cultural factors have been shown to play an important role in the development and persistence of health inequities. Identifying and addressing these factors is essential to achieving health equity for all individuals and communities.

(See Hatzenbuehler et al., 2013; Latif, 2020; Lavizzo-Mourey et al., 2021; Rural Health Information Hub, 2022.)

The ACCESS Model

The ACCESS model is a comprehensive approach to promoting cultural competence in health care services. It emphasizes the importance of awareness, knowledge, and skills in providing effective care for diverse populations. By understanding the unique cultural perspectives and experiences of clients, health care providers can work to build trust, reduce disparities, and improve health outcomes.

Nurses and other health care providers can use the ACCESS model to deliver culturally responsive care by first assessing clients' cultural background and beliefs and then adapting their communication style and negotiating a care plan that is respectful of the client's beliefs and values. Nurses can also establish a trusting relationship with clients by demonstrating sensitivity to nonverbal cues and ensuring that the client feels safe and comfortable in the health care setting.

Components of the ACCESS Model

The ACCESS model is a framework that health care providers can use to deliver culturally competent care to clients from diverse backgrounds. The model consists of six key components: assessment, communication, cultural negotiation and compromise, establishing respect and rapport, sensitivity, and safety (Narayananam, 2002). Assessment involves evaluating a client's cultural background, including their health beliefs and practices.

Additionally, understanding the client's previous interaction with the health care system, such as LGBTQIA+ clients, is needed. This information can help nurses and other health care providers tailor care plans to meet the unique needs of each client:

- Communication is a critical component of delivering transcultural care. Nurses must be aware of and use the

- cultural communication norms of the client, both verbal and nonverbal, to ensure effective communication.
- Cultural negotiation and compromise involve being aware of cultural differences and understanding how the client perceives the health care issue. This can help nurses and other health care providers tailor care plans that are respectful of the client's beliefs and values.
 - Establishing respect and rapport is vital for clients to maintain their dignity. When health care providers show respect for the client's culture and beliefs, the client is more likely to have trust in the health care provider, especially during times of crisis.
 - Sensitivity involves demonstrating sensitivity toward clients during interactions with health care providers. This includes using terms that clients understand to explain their health situation and trying to understand their needs pertaining to their culture and beliefs.
 - Safety is the idea that health care providers should not engage in any action that disrespects the client's culture, which could cause the client to feel culturally unsafe. This component emphasizes the importance of cultural sensitivity and respect in delivering effective health care services.

Using the ACCESS Model as a Framework to Deliver Transcultural Nursing Care

The ACCESS model provides nurses with a comprehensive framework for delivering transcultural nursing care. As discussed in [Transcultural Nursing](#), transcultural nursing seeks to provide culturally sensitive and competent care to individuals from diverse cultural backgrounds. By assessing cultural backgrounds, communicating effectively, acquiring cultural knowledge, establishing supportive care environments, and seeking client feedback, nurses can enhance their cultural competence and deliver care that is sensitive, respectful, and culturally responsive.

The first step of the ACCESS model involves assessing the cultural background of individuals and understanding how it shapes their health beliefs and behaviors. This supports the development of a culturally sensitive care plan tailored to their specific needs. According to Romem et al. (2021), by conducting a comprehensive assessment, nurses can identify cultural factors that may influence health practices and beliefs, facilitating the delivery of client-centered and culturally responsive care.

Effective communication is pivotal to transcultural nursing care. It involves using inclusive language, avoiding assumptions, and ensuring cultural nuances are acknowledged. The ACCESS model emphasizes the importance of clear communication and understanding clients' preferences. Effective communication involves active listening, being respectful, and acknowledging cultural differences, which can foster trust and enhance client-provider rapport (Narayanasamy, 2002).

Cultural knowledge is essential for providing quality care to culturally diverse clients. The ACCESS model promotes cultural competence by encouraging nurses to continually update and broaden their knowledge of diverse cultures and communities. Sharifi et al. (2019) emphasize the importance of nurses familiarizing themselves with the customs, beliefs, values, and practices of various cultures to provide culturally sensitive care.

A supportive care environment is crucial for promoting positive health outcomes among clients from diverse cultural backgrounds. The ACCESS model suggests displaying visual cues such as posters or brochures that show support for different cultures. Providing a welcoming environment that respects clients' unique backgrounds and values is associated with improved client satisfaction and better health outcomes (Medina-Martínez et al., 2021).

The final step of the ACCESS model involves seeking client feedback and continuously evaluating the effectiveness of care. By actively involving clients in their care and soliciting their feedback, nurses can identify areas for improvement and adjust accordingly. Medina-Martínez et al. (2021) highlighted the importance of client feedback in identifying areas of cultural insensitivity within health care settings, which underscores the need for ongoing evaluation to provide quality, person-centered care. [Table 24.3](#) provides an example of using the ACCESS model with a client.

Assessment	Assess the client's cultural background, and understand how it influences their health beliefs and expectations. Inquire about the client's gender identity, pronouns, and how they want to be addressed.
Communication	Use inclusive language, and avoid heteronormative assumptions or reinforcing stereotypes. Provide clear explanations, and discuss the need for sensitive exams, respecting the client's comfort level. Familiarize yourself with legal protections, discrimination laws, and organizational policies related to LGBTQIA+ individuals.
Cultural negotiation and compromise	Continuously update knowledge about LGBTQIA+ culture and communities. Stay informed about new information and resources supporting LGBTQIA+ health. Talk with the client to understand their concerns, and work with them to find an alternative treatment plan that is respectful of their values and beliefs.
Establishing respect and rapport	A nurse is working with a client who has experienced discrimination in the past due to their race, ethnicity, sexual orientation, or gender identity. The nurse shows respect for their experiences, helping to build trust and rapport.
Sensitivity	Create an environment that is supportive and affirming of LGBTQIA+ clients. Display posters or brochures in waiting areas that show support for LGBTQIA+ individuals Take the time to understand the client's concerns, and use language that is respectful and sensitive to their background when discussing their diagnosis and treatment.
Safety	A nurse is working with a client who identifies as transgender and has experienced trauma related to their identity. The nurse takes care not to engage in any actions or language that could trigger traumatic memories or cause the client to feel unsafe or disrespected.

TABLE 24.3 Example of the ACCESS Model in Action (See Romem et al., 2021.)

CASE REFLECTION

Applying the ACCESS Model

Read the scenario, and then respond to the questions that follow.

This scenario continues to follow Emily's work with Hyeon Lee. Working with the interpreter, Emily helps schedule regular follow-up visits and establishes clear communication channels for any questions or concerns between visits. Hyeon's recovery proceeds smoothly, and her cultural and linguistic needs are met, leading to a positive client experience and adherence to the care plan.

The home care nurse can also use the ACCESS model as a framework for this scenario:

A—Assessment: Emily begins with a comprehensive assessment of Hyeon's needs, including her language proficiency, cultural background, family dynamics, and medical condition. Emily's recognition that using a family member as an interpreter is not best practice is part of this initial assessment.

C—Communication: Emily ensures that communication is clear and effective by engaging a professional interpreter. Although Hyeon's daughter speaks English well, Emily opts for professional services to maintain objectivity and accuracy in conveying medical information.

C—Cultural Competence: Emily actively seeks to understand Korean cultural norms and beliefs that may influence Hyeon's care. This includes respecting preferences such as modesty during physical assessments and considering cultural attitudes toward health, illness, and family roles.

E—Establishment of Mutual Goals: Emily involves Hyeon's family in the care plan and sets recovery goals that align with Hyeon's cultural values and expectations. By involving the family, she ensures that the care plan is acceptable and tailored to Hyeon's individual needs.

S—Sensitivity: Emily exhibits sensitivity to Hyeon's cultural background, recognizing that care practices must be adapted to meet her unique needs. This includes connecting Hyeon with Korean community centers and being

mindful of dietary preferences and other culturally specific aspects of care.

S—Support: Regular follow-up visits and clear communication channels support Hyeon's ongoing care. Emily's approach facilitates a smooth recovery process, ensures adherence to the care plan, and leads to a positive client experience.

By utilizing the ACCESS model, Emily is able to deliver care that is culturally sensitive, respectful, and effective. Emily works to understand and respect Hyeon's cultural background, beliefs, and values while also ensuring her safety and comfort. This helps to build trust and rapport, which is essential for providing effective care.

1. How did Emily's approach to establishing mutual goals with Hyeon's family align with the CLAS standards for culturally responsive care? Provide at least one specific example to illustrate your answer.
2. What specific aspects of Hyeon's needs might be included in Emily's comprehensive assessment, and how did this assessment contribute to providing culturally responsive care?
3. Explain the role of trust building and rapport in providing effective, culturally responsive care for clients like Hyeon, and provide specific examples of how Emily's approach helped to build trust and rapport with Hyeon.

24.3 The Nurse's Role in Promoting Organizational Cultural and Linguistic Competency

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 24.3.1 Advocate for policies of social justice and health equity that promote cultural and linguistic responsiveness.
- 24.3.2 Implement sociocultural and linguistically responsive interventions.
- 24.3.3 Develop partnerships to support organizational cultural and linguistic competence.

Nurses play an important role in promoting organizational cultural and linguistic competency. According to Cervený et al. (2022), nurses can integrate culturally competent behaviors into their daily interactions by putting their awareness, attitude, and knowledge into practice through effective and respectful communication and body language. Additionally, promoting ethnic diversity within the nursing workforce enhances the ability to provide culturally competent care to meet the needs of an increasingly diverse population. At the organizational level, cultural competence or responsiveness refers to a set of congruent behaviors, attitudes, and policies that enable a system, agency, or group of professionals, including nurses, to work effectively in multicultural environments. Nurses, along with other health care professionals, should have the capacity to value diversity, conduct self-assessment, manage the dynamics of difference, acquire and institutionalize cultural knowledge, and adapt to diversity and the cultural contexts of the communities they serve. By embodying cultural and linguistic competency in their daily practice, nurses can help promote the provisions of CLAS, which respond to the individual preferences and needs of each client, improve health outcomes, and decrease health disparities.

Nurse Advocacy for Policies That Support Cultural Responsiveness

According to the American Nurses Association (ANA) Standard 8 (2021), nurses play a vital role in advancing health care policy and ensuring equal access to health care for all individuals. Policy discussions often involve the effects of discrimination, oppression, and social and environmental determinants of health on cultural groups, leading to health disparities. As advocates, nurses promote policies that aim to improve the health and well-being of culturally diverse, underserved, or underrepresented individuals. This includes advocating for equal access to health care services, tests, interventions, and health promotion programs for all consumers, with a particular emphasis on those who are culturally diverse and underserved.

To achieve this goal, nurses must advocate for appropriate funding to support the planning, delivery, and sustainability of culturally congruent care. This means advocating for sufficient resources and funding to ensure that health care services are culturally sensitive and responsive to the needs of diverse populations.

Nursing schools should incorporate cultural content throughout all nursing curricula that place an emphasis on education about cultural norms, values, and health-related needs within diverse communities. This foundational knowledge enables nurses to identify policy areas that require attention and reform. Nurses can participate in

policy-making processes at local, state, and national levels, where they can contribute to drafting policies that promote cultural training, adequate interpretation services, and equitable resource allocation. Nurses can also support policies that encourage a diverse nursing workforce and create welcoming spaces for clients and health care workers.

Direct involvement with communities is essential for nurses to understand specific cultural needs, preferences, and barriers to health care access. This grassroots-level insight can guide advocacy efforts in shaping policies that directly address community needs. Evidence-based practice is central to nursing, and the same applies to advocacy. Nurses must employ existing research and generate new evidence to support the need for policies promoting cultural competency.

Nurse researchers are encouraged to build substantial research programs beyond descriptive investigations. The essential next step is to design and test interventions that have meaning for populations from different cultures and improve their health and quality of life. Because this step requires sample sizes large enough to support meaningful conclusions, nurses and supporters need to advocate for more funding for these studies at the national level. Such research can help to eliminate the dismal inequities seen in diverse-consumer health outcomes.

Nurses can raise awareness about the importance of cultural competency and the specific policy changes needed to support it. Utilizing media, professional networks, and public speaking opportunities can help to reach wider audiences and generate support for cultural competency policies. [Table 24.4](#) provides some strategies nurses can use to advocate for policies that support cultural competency.

Advocacy	Explanation	Examples
Engage with Health Care Organizations	Nurses can collaborate with health care organizations to advocate for policies and initiatives that support cultural competency.	<ul style="list-style-type: none"> • Participate in quality improvement projects and processes • Serve on diversity, equity, and inclusion committees • Provide input on the development of policies and guidelines that promote culturally competent care
Partner with Administrators	Nurses can collaborate with administrators to promote cultural competency within health care institutions.	<ul style="list-style-type: none"> • Advocate for the inclusion of cultural competency training in staff development processes and programs • Ensure that resources and support materials are available to health care providers • Promote the implementation of inclusive practices that address the cultural needs of diverse client populations

TABLE 24.4 Strategies for Advocacy (See Williams et al., 2018.)

Advocacy	Explanation	Examples
Get Involved with Policymakers	Nurses can engage with policymakers at local, regional, and national levels to advocate for policies that support cultural competency.	<ul style="list-style-type: none"> • Participate in policy development processes and programs • Provide evidence-based research on the impact of cultural competence on health care outcomes • Collaborate with policymakers to shape policies that address health care disparities and promote health equity
Collaborate with Community Leaders	Nurses can actively collaborate with community leaders to gain insights into the specific cultural needs and preferences of diverse communities (Figure 24.5).	<ul style="list-style-type: none"> • Build partnerships with community leaders to develop culturally tailored strategies and initiatives that address the unique needs of different populations • Work with community leaders to promote cultural competence and improve access to quality health care
Conduct Nursing Research	Nurse researchers can design and test interventions.	<ul style="list-style-type: none"> • Create interventions that have meaning for populations from different cultures and improve their health and quality of life

TABLE 24.4 Strategies for Advocacy (See Williams et al., 2018.)**FIGURE 24.5** Members of the Baton Rouge, Louisiana, community participate in community engagement and listening sessions to discuss opportunities and challenges around food, nutrition, and health in Black communities. By participating in such community sessions, nurses

learn firsthand about the needs of the communities they serve. (credit: Perry Rainosek/USDA/Flickr, Public Domain)

Nursing Practice That Is Congruent with Cultural Diversity

Nurses can practice with sociocultural and linguistically responsive interventions (Jongen et al., 2018). Cultural practices can vary widely between different ethnic, religious, and social groups, and it is important for nurses to be aware of and sensitive to these differences to provide appropriate care ([Figure 24.6](#)). [Table 24.5](#) provides some examples of the types of cultural practices that nurses might encounter.

FIGURE 24.6 Providing care that is congruent with cultural diversity requires nurses to be aware of clients' health beliefs and practices. For example, some clients may integrate traditional Chinese medicine into their health care practices. (credit: "Apothecary mixing traditional Chinese medicine at Jiangsu Chinese Medical Hospital in Nanjing, China" by Kristoffer Trolle/Flickr, CC BY 2.0)

Communication Styles	<ul style="list-style-type: none"> Nonverbal communication: gestures, eye contact, and physical touch might have different meanings across various cultures. Language barriers: understanding the client's preferred language and possibly using medical interpreters if necessary
Health Beliefs and Practices	<ul style="list-style-type: none"> Traditional healing practices: use of herbal remedies, acupuncture, or spiritual healing Perceptions of illness: different cultures might have varying beliefs about the causes and appropriate treatments for illness.
Dietary Practices	<ul style="list-style-type: none"> Religious dietary restrictions: such as halal or kosher diets, vegetarianism in Hinduism, or fasting during Ramadan for Muslims Cultural food preferences: preferences and taboos about foods and preparation methods
Family Roles and Dynamics	<ul style="list-style-type: none"> Decision-making: in some cultures, family members or community elders might be deeply involved in medical decisions. Gender roles: understanding the appropriate interactions between genders in different cultures
Modesty and Personal Space	<ul style="list-style-type: none"> Dress requirements: preferences for covering certain parts of the body Examination etiquette: respecting preferences for a same-sex health care provider or having a family member present during physical examinations

TABLE 24.5 Examples of Cultural Practices

End-of-Life Care and Death Rituals	<ul style="list-style-type: none"> Advance directives: understanding cultural perspectives on life-sustaining treatment Death rituals: respecting cultural rituals related to death and grieving, such as handling of the body or mourning practices
Mental Health Perspectives	Stigmatization: recognizing cultural stigmas related to mental health conditions and adapting communication and treatment accordingly
Childbirth Practices	Birthing customs: preferences for birthing positions, people present at birth, post-birth rituals, etc.
Disability and Long-Term Illness	Cultural attitudes: understanding how different cultures perceive and manage disability and long-term illnesses
Alternative and Complementary Therapies	Acceptance or rejection: different attitudes toward conventional medicine versus alternative therapies
Trust in Health Care Providers	Historical or cultural mistrust: recognizing potential mistrust due to historical or cultural factors and building rapport accordingly
Substance Use and Addiction	Cultural perspectives: understanding how various cultures perceive and respond to substance use and addiction
Sexual Health and Orientation	Cultural norms: respecting cultural norms related to sexuality and sexual orientation

TABLE 24.5 Examples of Cultural Practices

Being aware of these cultural practices requires ongoing education, openness to learning, and a willingness to ask clients about their preferences and beliefs. Individualized care that respects cultural diversity will generally lead to better client satisfaction and outcomes. It is important to approach cultural practices with curiosity rather than judgment, recognizing that each client's cultural context is unique and multifaceted.

Developing Partnerships to Support Organizational Cultural and Linguistic Competence

Cultural and linguistic competence within health care organizations is essential for delivering effective and equitable care to diverse populations. Community health nurses play a pivotal role in this endeavor by developing partnerships with various concerned parties (Handtke et al., 2019) and can use the following strategies:

1. Assessing Community Needs
 - Engaging with the community: understand the unique cultural and linguistic needs of the community through direct engagement.
 - Using existing research: analyze data and existing studies that identify cultural and linguistic gaps in care.
 - See [Assessment, Analysis, and Diagnosis](#) for more details on conducting a community needs assessment.
2. Collaboration with Key Community Partners
 - Identifying partners: engage with community leaders, cultural organizations, educational institutions, and other health care providers.
 - Defining shared goals: develop common objectives aligned to the community's cultural and linguistic needs.
 - See [Assessment, Analysis, and Diagnosis](#) for more details on collaborating with community partners.
3. Implementing Cultural and Linguistic Training:
 - Developing curricula: create training programs that enhance cultural awareness and linguistic skills.
 - Promoting ongoing education: encourage continuous learning through workshops, seminars, literature, and online resources.
 - See [Planning Community Health Education](#) for more details on planning community education programs.
4. Leveraging Technology:
 - Using language assistance tools: implement technology that facilitates effective language translation and interpretation.

- Promoting telehealth services: ensure that virtual health care platforms accommodate individuals with diverse linguistic needs.

5. Policy Advocacy:

- Supporting legislative initiatives: advocate for policies that promote cultural and linguistic competence at local, state, and national levels.
- Aligning with accreditation standards: ensure that practices align with standards set by accrediting bodies.

6. Evaluating and Adapting Strategies:

- Monitoring outcomes: regularly assess partnership initiative effectiveness via feedback and data analysis.
- Iterating strategies: continuously refine and adapt strategies to meet evolving community needs.
- See [Implementation and Evaluation Considerations](#) for more details on evaluating program effectiveness.

Developing partnerships to support organizational cultural and linguistic competence is a dynamic and multifaceted process. Community health nurses, in collaboration with various community partners, can spearhead efforts to ensure that health care delivery aligns with the diverse needs of the communities they serve. Through thoughtful engagement, education, advocacy, technology utilization, and continuous evaluation, health care organizations can create an environment that truly resonates with all members of the community.

Chapter Summary

24.1 Culturally Responsive Care

Culturally and linguistically diverse populations continue to grow, and health care professionals, including nurses, are recognizing the need to consider cultural attitudes, beliefs, and values to provide equitable and effective health care to all clients. The CLAS standards provide a framework to provide culturally and linguistically appropriate services.

24.2 Health Care Tools to Identify Organizational Strengths and Areas for Improvement

There are a range of tools and strategies, including cultural competency self-assessments, communication, and interventions such as the ACCESS model, that are aimed at identifying strengths and pinpointing areas where improvements can be made in culturally responsive care. By focusing on these aspects, nursing professionals and health care organizations can create an environment where all

Key Terms

community engagement collaborating with community organizations and partners to develop culturally appropriate services and programs

cultural brokers individuals who act as intermediaries or go-betweens among different cultures, using their knowledge and understanding of different cultures to help facilitate communication, understanding, and advocacy on behalf of an individual or group

cultural safety an environment that is spiritually, socially, and emotionally safe, as well as physically safe for people where there is no assault, challenge, or denial of their identity, of who they are and what they need

limited English proficiency (LEP) individuals who do

clients, regardless of their cultural or linguistic background, feel understood, respected, and well-cared for.

24.3 The Nurse's Role in Promoting Organizational Cultural and Linguistic Competency

Nurses play an important role in promoting organizational cultural and linguistic competency. Nurses can integrate culturally competent behaviors into their daily interactions by putting their awareness, attitude, and knowledge into practice through effective and respectful communication and body language. Nurses, along with other health care professionals, should have the capacity to value diversity, conduct self-assessment, manage the dynamics of difference, acquire, and institutionalize cultural knowledge, and adapt to diversity and the cultural contexts of the communities they serve.

not speak English as their primary language and who have a limited ability to read, speak, write, or understand the English language

professional medical interpreter an individual who has passed a certification examination to demonstrate they have met nationally set standards to ensure client safety and compliance with federal guidelines and requirements

qualified bilingual staff member a staff member who has completed an assessment of their ability to communicate in a medical setting directly with clients who speak a target language

workforce diversity when the workforce of an organization resembles the population at large

Review Questions

1. Which action should the nurse perform when teaching a client with LEP and who is from a culture different than their own?
 - a. Use accurate medical terms
 - b. Assume the client has basic math skills
 - c. Perform a health literacy assessment
 - d. Research practices of the client's culture online

2. A community health nurse has taken the Promoting Cultural and Linguistic Competency Self-Assessment Checklist for Personnel Providing Primary Health Care Services and is reviewing the results. Which action describes how the results of this self-assessment checklist should be utilized?
 - a. To identify areas for self-improvement

- b. To determine readiness for job advancement
 - c. To rate job performance
 - d. To discipline an employee
3. Which action by a health care organization is an example of a leadership commitment to cultural competence?
- a. Developing a policy for use of trained interpreters
 - b. Enhancing client satisfaction
 - c. Improving health care outcomes
 - d. Increasing health care access to all individuals
4. Which action by a nurse promotes a welcoming environment for culturally diverse clients?
- a. Calling the client by the name on their birth certificate
 - b. Using a family member to interpret for a client with LEP
 - c. Displaying brochures and posters that represent diversity
 - d. Providing a client's bill of rights in languages other than English
5. Which action by a nurse working at a community health center is an example of using the ACCESS model of transcultural care?
- a. Utilizing a standardized plan of care
 - b. Developing the plan of care with the client
 - c. Using a plan of care developed for a specific cultural group
 - d. Collaborating with other nurses to develop the plan of care
6. Which action by a health care organization demonstrates the development of a culturally and linguistically competent plan to meet the needs of diverse populations of the community?
- a. Informing the community about their cultural needs
 - b. Collaborating with community leaders
 - c. Developing strategies that have worked at other health care organizations
 - d. Developing consistent strategies that will not change over time
7. A nurse is evaluating the effectiveness of a cultural competence training program. Which outcome is the nurse most likely to measure?
- a. Increase in client acuity levels
 - b. Reduction in health care costs
 - c. Improvement in client satisfaction scores
 - d. Decrease in client wait times
8. A nurse is a member of an interdisciplinary committee whose goal is to develop a culturally and linguistically competent organization. Which action by the committee would help to meet this goal?
- a. Develop an organizational mission statement for cultural competence
 - b. Encourage each department to develop a cultural competency plan
 - c. Encourage employees to find ways to develop their cultural competence
 - d. Hire individuals with the most work experience
9. Using the National CLAS as a guide, which service should be offered to clients who have LEP?
- a. Availability of interpreter services at a minimal fee
 - b. Language assistance in the client's preferred language
 - c. Interpretation services using family members
 - d. Trained interpretation within 48 hours of hospital admission
10. Which action by a community health center demonstrates its commitment to providing a welcoming environment for LGBTQIA+ individuals?

- a. Clearly marking restrooms for men and women
- b. Including options other than male/female on intake forms
- c. Using pronouns consistent with outward appearance
- d. Avoiding asking about sexual orientation

CHAPTER 25

Managing the Dynamics of Difference

FIGURE 25.1 Learning how to provide culturally responsive care is an ongoing process for nurses, enabling them to customize care based on a broad understanding and sincere appreciation of the rich diversity of humanity. (credit: modification of work by Mike Kaplan/U.S. Air Force/Flickr, CC BY 2.0)

CHAPTER OUTLINE

- 25.1 Strategies to Promote Culturally Responsive Nursing
- 25.2 Root Causes of Stereotypes and Biases
- 25.3 Managing Conflict
- 25.4 Creating an Atmosphere of Trust and Mutual Respect

INTRODUCTION Sarah, a new nurse from a middle-class neighborhood, works at a public health department in a culturally diverse community. She conducts home visits as part of a maternal and child health program, providing women's health services, hosting immunization clinics, and organizing community health fairs to promote preventive health measures. Though the community members Sarah works with come from cultural backgrounds different from her own, Sarah remains confident in her ability to provide clients with culturally responsive, high-quality care.

Health care is increasingly characterized by encounters between individuals from varied cultural backgrounds. Because nurses interact with clients, families, and colleagues with a rich tapestry of cultural beliefs, values, and practices, the need for nurses to manage cultural conflicts is paramount. Nurses foster an inclusive and respectful health care environment conducive to improved client outcomes. Cultivating cultural sensitivity and humility is an imperative for modern nursing practice.

This chapter provides guidance on effectively managing cultural conflicts. By understanding and implementing effective strategies, nurses can ensure that clients receive high-quality, client-centered care regardless of cultural differences. Building on prior chapters, this chapter highlights the significance of assessing personal biases and assumptions by participating in self-reflection and lifelong learning. The chapter will follow Sarah as she moves

through the process of managing conflict to promote culturally responsive care for the clients in her community.

25.1 Strategies to Promote Culturally Responsive Nursing

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 25.1.1 Describe strategies to integrate cultural humility into the five components of cultural competence.
- 25.1.2 Utilize the mnemonic A-S-K-E-D to promote cultural competency.
- 25.1.3 Differentiate between conscious impermeability and unconscious impermeability.
- 25.1.4 Describe the process of advancing from a state of unawareness to a heightened state of mindfulness.
- 25.1.5 Identify actions that promote cultural humility in providing client-centered care.
- 25.1.6 Differentiate between cultural sensitivity and cultural humility.

[Culturally and Linguistically Responsive Nursing Care](#) discusses the importance of cultural responsiveness, particularly the attributes of cultural awareness, knowledge, skills, encounters, and humility. These concepts are essential in establishing positive client relationships. This chapter builds on this foundation to address strategies to promote culturally responsive nursing.

Integrating Cultural Humility

As discussed in [Culturally and Linguistically Responsive Nursing Care](#), cultural humility is a lifelong process of self-awareness, self-reflection, and a willingness to learn from and engage with individuals from different cultural backgrounds that promotes effective health care interactions (Tervalon & Murray-García, 1998). Cultural humility goes beyond competency, emphasizing a continuous process of self-reflection and self-awareness. Nurses who practice cultural humility approach each interaction as an opportunity to learn, appreciating that they may not always have the answers but can seek better to comprehend the nuances of another person's cultural background.

The framework for cultural humility is based on two models: The Process of Cultural Competence in Healthcare (Campinha-Bacote, 2002) and A Biblically Based Model of Cultural Competence (Campinha-Bacote, 2013). These models form the foundation for cultural competency, “the synergistic process between cultural humility and cultural competence in which cultural humility permeates each of the five components of cultural competence: cultural awareness, cultural knowledge, cultural skill, cultural desire, and cultural encounters” ([Figure 25.2](#)) (Campinha-Bacote, 2018). **Conscious permeability** emerges when individuals actively apply cultural humility in their daily lives and interactions. It involves acknowledging that cultural competence is a continuous journey rather than a destination. Conscious permeability enables individuals to be flexible and adapt their behavior, communication style, and decision making in response to different cultural contexts.

FIGURE 25.2 This image depicts the infusion of cultural humility into each of the five components of cultural competence: cultural awareness, cultural knowledge, cultural skill, cultural desire, and cultural encounters. (attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

Campinha-Bacote (2019) contends that for nurses to enhance their journey toward cultural competency, they must humbly consider, “Have I ASKED myself the right questions?” The A-S-K-E-D mnemonic represents self-examination questions regarding one’s cultural awareness, skill, knowledge, encounters, and desire. The components of the mnemonic include:

- **Awareness:** Am I aware of my prejudices and biases and the presence of racism and other “isms”?
- **Skill:** Do I know how to conduct a culturally specific history, physical, mental health, medication, and spiritual assessment in a culturally sensitive manner?
- **Knowledge:** Do I have knowledge regarding different cultures’ worldview, the field of biocultural ecology, and the importance of addressing social determinants of health?
- **Encounters:** Do I have sacred and unremitting encounters with people from cultures different from mine, and am I committed to resolving cross-cultural conflicts?
- **Desire:** Do I really “want to” engage in the process of competency?

Cultural sensitivity in nursing care refers to the awareness, understanding, and consideration of clients and their families’ diverse cultural backgrounds, beliefs, practices, and preferences. It involves providing health care services that respect and accommodate cultural differences, ensuring clients receive care tailored to their needs that maintains their cultural dignity and values (Leininger, 2002). Cultural sensitivity and cultural humility are closely related concepts that work in tandem to promote cultural competency in health care. Both emphasize the importance of recognizing and respecting clients’ diverse cultural backgrounds, beliefs, and practices. Cultural sensitivity serves as a foundation for cultural humility, allowing health care professionals to recognize and appreciate cultural differences. Cultural humility goes further, requiring individuals to question their assumptions, engage in self-examination, and strive for a deeper understanding of other cultures (Tervalon & Murray-García, 1998). Cultural humility builds on cultural sensitivity to promote curiosity, respect, and a willingness to be corrected or educated by clients about their cultural beliefs. It encourages health care professionals to collaborate with clients, share power, and foster more effective partnerships in care.

Moving from a State of Becoming Aware to a State of Being Aware

The process of fully integrating cultural humility occurs across a continuum from impermeability to permeability (Campinha-Bacote, 2018). As nurses progress toward competency, they move through stages from being unaware of cultural humility to being mindful and spontaneously engaging in it during cultural encounters. **Unconscious impermeability** refers to a lack of recognition that cultural humility is necessary to become culturally competent. At this stage, the nurse may not be aware of power imbalances that influence care (Campinha-Bacote, 2019). Power imbalances, which arise due to various factors, including social status, language fluency, health system familiarity, and previous discrimination, can impede culturally sensitive care delivery.

At the stage of **conscious impermeability**, a nurse recognizes the importance of cultural humility but struggles to demonstrate it in practice (Campinha-Bacote, 2018). In contrast, conscious permeability is the mindful act of learning to become culturally humble and use a cultural lens throughout the entire client encounter (Campinha-Bacote, 2018). Finally, in **unconscious permeability**, the nurse can spontaneously operate from a place of cultural humility. These stages represent the process of moving from a state of becoming aware to a state of being aware. Integrating cultural humility into all aspects of cultural awareness, knowledge, skills, encounters, and desire can lead to unconscious permeability, as shown in [Table 25.1](#).

Attribute	Actions to Promote the Integration of Cultural Humility
Cultural Desire	<ul style="list-style-type: none"> Develop cultural competence out of genuine desire, not obligation Commit to understanding and appreciating diverse cultures with sincere curiosity and eagerness to engage
Cultural Awareness	<ul style="list-style-type: none"> Develop deep understanding of how cultural factors impact human interactions, relationships, and communication Be open-minded and receptive to learning about different cultures and be willing to examine one's cultural biases and assumptions Reflect on one's cultural background, experiences, and beliefs in relation to those of others
Cultural Knowledge	<ul style="list-style-type: none"> Acquire solid educational background in diverse groups to provide culturally sensitive care Learn from the community's lived experiences and stay curious about other cultures Ask questions, read diverse texts, watch films, learn another language, attend classes and workshops, and participating in cultural events
Cultural Skill	<ul style="list-style-type: none"> Effectively and sensitively integrate one's cultural awareness and knowledge into practical actions and interactions Assess clients with open-ended interviews, cultural competence tools, or questionnaires while respecting their autonomy and preserving confidentiality Be mindful that each client is unique and avoid cultural generalizations while remaining aware of biases
Cultural Encounters	<ul style="list-style-type: none"> Seek cultural encounters in various forms, from community events to immersive travel experiences, to interact with people from different cultural backgrounds, fostering mutual respect and enhancing cultural competence Learn to navigate diverse and globalized environments effectively Recognize the limits of one's understanding and be willing to learn from others Acknowledge that each person's experiences are unique and cannot be fully understood without active engagement

TABLE 25.1 Actions to Promote the Integration of Cultural Humility into the Five Components of Cultural Competence (See Campinha-Bacote 2011, 2018.)

25.2 Root Causes of Stereotypes and Biases

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 25.2.1 Explore various techniques to assess cultural and social identity.
- 25.2.2 Distinguish between the factors that create and reinforce stereotypes and biases.
- 25.2.3 Recognize the principles of decolonization in nursing.
- 25.2.4 Define privilege.
- 25.2.5 Explain how privilege can affect health care interactions.
- 25.2.6 Examine how nurses can utilize privilege to promote health equity and address health care disparities.
- 25.2.7 Identify areas for growth and development.

The process of developing cultural humility involves addressing bias and stereotypes and managing conflicts. On this journey, nurses shift from being unaware of their biases and cultural stereotypes (unconscious impermeability) to heightened awareness of their biases and active commitment to self-reflection and learning (active engagement). To accomplish these goals, nurses must understand where their stereotypes and biases come from.

Assessing One's Own Cultural and Social Identity

Cultural and social identity are related but distinct concepts that refer to different aspects of a person's sense of self and belonging. An individual's cultural and social identities combine to form their cultural background. The [ANA Code of Ethics](https://openstax.org/r/nursingworldethics) (<https://openstax.org/r/nursingworldethics>) (2021) emphasizes the need for nurses to be aware of their cultural background to avoid letting personal biases affect the therapeutic relationship. This requires introspection into one's cultural beliefs, perceptions, and assumptions. Nurses should recognize and understand the effects of oppression, racism, discrimination, and stereotyping personally and professionally (ANA, 2015).

As discussed in [Cultural Influences on Health Beliefs and Practices](#), cultural identity refers to a sense of belonging and identification with a particular cultural group. Cultural identity provides a foundation of cultural values, beliefs, and practices that contribute to how individuals engage with their community and express themselves culturally. On the other hand, social identity encompasses the various aspects of an individual's identity that are shaped by their membership in different social groups beyond just culture.

Assessing one's cultural identity is a process of self-reflection and exploration that helps individuals better understand their cultural background, beliefs, values, and experiences. While there is no definitive tool to fully capture an individual's cultural identity, various methods and exercises can aid in this process; examples include:

- **Cultural genogram:** A cultural genogram depicts family members' cultural identities, traditions, and migration histories. Creating a cultural genogram helps individuals understand the interplay of cultural influences within their family and how it has shaped their cultural identity (Haber et al., 2022).
- **Cultural autobiography:** This written account of an individual's cultural experiences, upbringing, and identity development allows individuals to reflect on significant cultural events, interactions, and how they have shaped their sense of self and cultural identity. Telling one's life story can promote self-reflection on power dynamics, but it can also reinforce harmful biases (Bruewer et al., 2021).

Social identity refers to an individual's self-concept derived from social groups. [Cultural Influences on Health Beliefs and Practices](#) discusses how individuals define themselves according to the social groups to which they belong. The Social Identity Wheel can aid nurses in exploring and comprehending their social identity ([Figure 25.3](#)). The Social Identity Wheel visually represents the different social identity categories that a person may hold by dividing a circle into sections or categories. These categories can include but are not limited to (University of Michigan LSA Inclusive Teaching, 2021):

- Race and Ethnicity
- Gender
- Sexual Orientation
- Religion
- Socioeconomic Status
- Age
- Nationality
- Disability Status
- Language
- Education
- Occupation
- Geographic Location

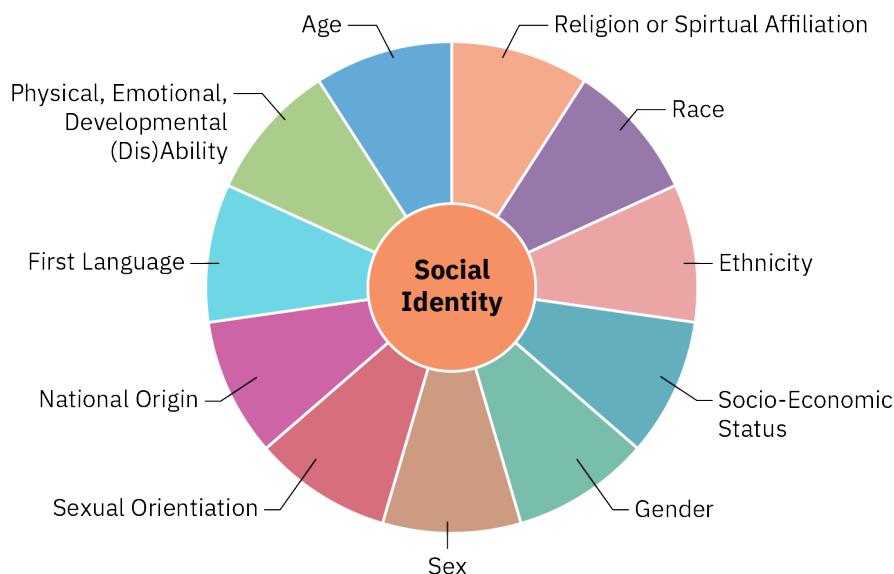

FIGURE 25.3 The Social Identity Wheel is a tool for promoting self-awareness and exploring the complexity of one's identity. (See University of Michigan LSA Inclusive Teaching, 2021; attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

The Social Identity Wheel helps individuals reflect on their many intersecting identities and understand how they impact their experiences and interactions with others. It can foster empathy when it helps an individual to acknowledge the privileges and disadvantages of their different identities. This awareness is crucial in promoting a more inclusive and equitable environment, as it helps individuals recognize their biases and become more sensitive to the experiences of others. By utilizing this tool, nurses can gain insights into their identities and develop a deeper appreciation for the diversity within themselves and others (University of Michigan LSA Inclusive Teaching, 2021).

SOCIAL IDENTITY WHEEL

The non-profit organization Facing History and Ourselves provides a template for creating your own [Social Identity Wheel](https://openstax.org/r/facinghistory) (<https://openstax.org/r/facinghistory>). Visit the site, create your own wheel, and then respond to the following questions.

1. Which identities most substantially impact how you perceive or define yourself?
2. Which identities strongly impact how you think other people perceive or label you?
3. Which identities most substantially impact how you perceive or define others?
4. How do factors of your identity inform your decision making in nursing practice?
5. How does your identity align with or differ from (conflict with) the identities of others?
6. What privileges and advantages are associated with your identity?
7. Describe how your social identity may inform your unconscious biases.
8. What have you learned about yourself from the process of creating your Social Identity Wheel?

Let's return to the scenario from the beginning of the chapter. For a few weeks, Sarah kept a journal and listened mindfully during client interactions. She realized that her viewpoints differed significantly from those of her clients and worried that she might have unconscious biases that could hinder her ability to show cultural humility and responsiveness. To overcome this challenge, Sarah decided to explore her own social identity by completing a Social Identity Wheel and assessing how her identity influences client care.

By recognizing the filters through which she views the world, Sarah became aware of potential biases and assumptions that may unconsciously influence her client interactions. This first step enabled Sarah to approach client interactions more openly, free from preconceived notions. Recognizing the impact of personal biases on client interactions prompted Sarah to question her assumptions to ensure she doesn't impose her values on clients and remains receptive to diverse perspectives. Sarah's decision to explore her social identity reflects a commitment to continuous learning. She understands that cultivating cultural humility is an ongoing process, and humility comes from a willingness to learn and adapt. This translates into more effective and empathetic care.

The insights Sarah gains from self-reflection directly inform her approach to client care. She becomes more attuned to each client's unique needs and values, ensuring that her care is culturally sensitive and respectful and increasing the likelihood that her clients feel seen, heard, and understood, fostering a therapeutic relationship built on trust.

Nurses can better understand their biases and stereotypes by acknowledging their cultural backgrounds and social identities. This helps nurses avoid making inaccurate assumptions about clients and mitigates their impact on client care. The next section explores the impact of cultural and social identity on biases and stereotypes.

Factors That Inform Stereotypes and Biases

As discussed in [Cultural Influences on Health Beliefs and Practices](#), values and beliefs can shape how individuals perceive the world and others. When these values and beliefs are based on limited information about others, they can lead to stereotypes and biases.

Cultural values and beliefs can shape biases that affect interpersonal interactions and decision-making processes. Ingrained through upbringing and societal influences, these values and beliefs can lead to the development of unconscious biases that impact how people interact with individuals from different cultural backgrounds, and these biases can influence judgments, attitudes, and behaviors toward others.

Social identity plays a role in shaping how individuals perceive themselves in relation to different social groups, and it can contribute to the development of biases and stereotypes toward others. The nested-levels framework developed by Skinner-Dorkenoo et al. (2021) depicts how different systemic levels influence individual attitudes and how individual attitudes also impact systems ([Figure 25.4](#)). For example, personal and interpersonal encounters, which are nested within communities and institutions that set the local context for interpersonal experiences, are the most immediate influences on racial bias. Communities are situated within broader cultural contexts that shape society's norms, values, and beliefs. At the outermost level, temporal influences capture how past manifestations of these systems continue to influence members of society (Skinner-Dorkenoo et al., 2021).

Skinner-Dorkenoo et al. (2021) contend that each level influences racial bias bidirectionally across the nested levels of the framework. At the innermost level, personal and interpersonal experiences, such as socialization from caregivers and interracial friendships, have the most proximal influence on individual-level racial bias, nested within communities and institutions that set the local context for interpersonal experiences. Communities are situated within a broader cultural context that shapes the norms, values, and beliefs that structure society. At the outermost level, temporal influences capture how past interpersonal, institutional or community, and societal influences continue to affect individuals throughout their lives.

While this model's primary focus is on how each level of influence affects individual-level attitudes, the levels also influence one another. For instance, culture can shape organizations and interpersonal experiences within that culture, as well as individual-level biases. Likewise, individual-level racial biases can mold interpersonal experiences, which can shape factors at the organizational and community level.

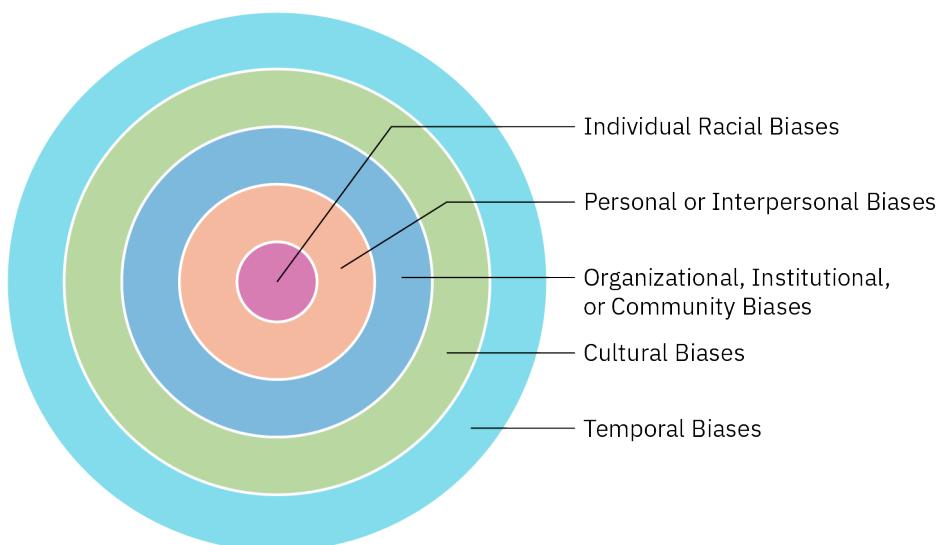

FIGURE 25.4 The nested-levels framework focuses on how each systemic level of influence influences individual-level attitudes and how individual-level attitudes influence systems. (See Skinner-Dorkenoo et al., 2023; attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

In-group favoritism, or **in-group bias**, is a psychological phenomenon referring to people's tendency to favor members of their own social or cultural in-group. This bias can manifest in various ways, including positive judgments, greater willingness to cooperate, and allocation of resources in a more favorable manner toward members of the in-group compared to individuals from other groups—*out-groups*. In 1979, both Tajfel & Turner and Brewer published research establishing the foundation for understanding in-group favoritism and its implications for intergroup relations. This knowledge is essential for comprehending theories on social identity, categorization, and cognitive biases that contribute to forming and maintaining in-group favoritism. [Table 25.2](#) outlines various factors that shape and influence stereotype and bias development.

Action	Description
In-Group Favoritism	People tend to show a preference for members of their social identity groups. This bias can lead to a more positive evaluation of individuals within one's group and a tendency to perceive them more favorably than those from different groups (Brewer, 1979; Tajfel & Turner, 1979).
Out-Group Homogeneity	Individuals may perceive members of other social identity groups as more similar than they are. This bias can result in oversimplified and generalized views of others from different groups and may influence social judgments and behaviors (Andreychik et al., 2020).
Confirmation Bias	Individuals may be more likely to notice and remember information confirming their biases or stereotypes about certain social identity groups. This confirmation bias reinforces and strengthens these biases over time (Velez et al., 2021).
Media and Cultural Influences	The portrayal of certain social identity groups in media can reinforce or perpetuate stereotypes or create new biases based on intersections of race, gender, and other social categories (Mastro, 2020).
Limited Interactions	Limited or negative interactions with individuals from certain social identity groups can contribute to forming biases and stereotypes. Lack of exposure to diverse perspectives may perpetuate inaccurate beliefs about these groups and contribute to developing and reinforcing negative stereotypes and biases (Craig et al., 2018).
Cognitive Efficiency	When information is presented in a format that is easy to understand, individuals tend to be more easily persuaded by that information, which can lead to biased perceptions and decision making (Critcher & Gilovich, 2021).

TABLE 25.2 Factors That Shape and Strengthen Stereotypes and Biases

Nurses need to understand how these factors shape their beliefs and values to comprehend their influence on

nursing decision making. Here are some effective techniques to create an inventory of personal values and beliefs:

- Performing Self-Reflection: Using introspection and thinking critically about personal values, beliefs, and cultural heritage can provide insight into how these factors influence perceptions, decisions, and interactions. This process also helps nurses recognize unconscious biases that might impact client care, encouraging them to question their assumptions and consider alternative perspectives (Richardson & Storr, 2020).
- Writing Down Values and Beliefs: Documenting personal values and beliefs, including those related to nursing practice, allows for clarity and deeper exploration. Consider how personal values align or conflict with professional standards and ethical guidelines. Writing down specific values related to respect, empathy, and client-centered care can be a foundation for ethical decision making (Gallagher, 2020).
- Evaluating Influence on Decision Making: After identifying values and beliefs, evaluate how they shape one's nursing practice. For example, how do they impact interactions with clients, colleagues, and health care team members? Reflect on instances where values might have influenced decisions and consider whether these decisions were aligned with client needs and cultural considerations (Epstein & Hundert, 2002).
- Identifying Areas for Improvement: Recognize areas where values and beliefs may differ from those of clients, colleagues, or the broader health care environment. Identifying potential conflicts helps one proactively address them. Consider situations where values might unintentionally affect one's ability to provide unbiased and culturally sensitive care (Haas & Greiner, 2020).

YOUR IDENTITY IS YOUR SUPERPOWER

[Access multimedia content \(<https://openstax.org/books/population-health/pages/25-2-root-causes-of-stereotypes-and-biases>\)](https://openstax.org/books/population-health/pages/25-2-root-causes-of-stereotypes-and-biases)

In this video, actor, director, and activist America Ferrera discusses her experiences with cultural stereotypes in the entertainment industry.

Watch the video, and then respond to the following questions.

1. In the presentation, America Ferrera describes the challenges she faced based in the entertainment industry based on cultural stereotypes. How did these challenges impact her personally and professionally?
2. America Ferrera mentions a casting director asking her to “sound more Latina.” What does this request reveal about the stereotypes and expectations placed on individuals based on their cultural background, and how does it connect to the broader issue of representation in the media?
3. America Ferrera received messages throughout her life that her identity was an obstacle. How did these messages affect her perception of herself, and what steps did she take to overcome these obstacles?
4. How can America Ferrera’s emphasis on the importance of questioning our own fundamental values and beliefs for change to occur be applied to the nursing field? Why is it essential for nurses to understand and reflect on their beliefs about others in the context of decision making?
5. America Ferrera states, “My identity is not my obstacle. My identity is my superpower.” How can this shift in perspective contribute to a more inclusive and diverse health care environment, and what lessons can nurses draw from this statement in their interactions with clients?

Privilege

The nursing profession has been shaped by Western perspectives and beliefs, representing a Eurocentric viewpoint, and by colonial ideologies which have been imposed on other cultures and societies. The ANA (2022) has urged the **decolonization** of nursing by addressing the lasting effects of colonialism on practice, education, and research. Decolonization in nursing is a process of critically examining and deconstructing the Eurocentric and colonial ideologies that have influenced nursing. It also promotes practices that center on decolonization and cultural humility. To promote decolonization in nursing, it is necessary to challenge these influences and create a health care system that is culturally sensitive and inclusive. This process requires challenging and dismantling historical and ongoing systems of oppression, including the privilege of specific knowledge systems and cultural perspectives over others (Zappas et al., 2021). This involves recognizing and valuing diverse cultural knowledge, traditional healing practices, and worldviews. A decolonization approach prioritizes culturally competent care that recognizes and

respects clients' unique cultural backgrounds and experiences (Fedje & Bissonette, 2019).

Decolonizing nursing requires acknowledging past injustices, establishing meaningful partnerships with diverse communities, integrating cultural humility into nursing practice, and advocating for policies that address health disparities and promote social justice. By doing so, nurses can contribute to providing equitable and respectful health care services that meet the unique needs and preferences of all individuals and communities, regardless of their cultural background. By adopting a decolonizing approach, nurses can help to eliminate health disparities and promote health equity for marginalized communities (Fedje & Bissonette, 2019).

The decolonization of nursing practice is closely related to the concept of privilege. **Privilege** refers to the advantages and benefits that specific individuals or groups enjoy due to their social identities, such as race, gender, sexual orientation, socioeconomic status, or other factors. Privilege can influence access to quality care, treatment decisions, and health outcomes. According to the ANA (2022), nursing students should develop a solid moral character and undergo professional formation to promote fair and respectful care while advocating effectively. To accomplish this, ANA (2022) contends that students must acknowledge their social privileges and ethically take responsibility to address unjust systems and structures. This requires critically analyzing beliefs, biases, and social structures contributing to health disparities.

The concept of privilege significantly impacts the provision of health care services, affecting both nurses and clients. Those who are privileged often have better access to health care resources, including insurance coverage, transportation, and medical facilities, which gives them an advantage over others (Togioka et al., 2023). The impact of privilege on health care encounters is explained in the following:

- Privilege can consciously or unconsciously lead to biases and stereotypes among health care providers. *For example*, providers with privilege may make assumptions or have preconceived notions about clients from marginalized groups, potentially leading to unequal treatment, discrimination, or neglect of certain clients' needs (Hobbs, 2018).
- Privilege can influence the dynamics of communication and trust between clients and health care providers (Togioka et al., 2023). *For example*, clients who belong to marginalized groups may be more skeptical or wary of providers who hold privileged identities, leading to challenges in establishing trust and effective communication.
- Privilege often results in a lack of diversity and representation in the nursing workforce (Togioka et al., 2023). Although the nursing population is becoming more diverse, minority nurses remain underrepresented. *For example*, the most common ethnicity of nurses in 2022 was White: 73.6 percent; Black or African American: 14.5 percent; Asian: 8.9 percent; and Hispanic or Latino: 8.1 percent (U.S. Bureau of Labor Statistics, 2023). This lack of representation can result in a deficiency of cultural understanding and sensitivity among nurses, causing cultural gaps. In addition, clients from marginalized groups may feel more comfortable and understood when they have health care providers with similar backgrounds or experiences.
- Privilege is intertwined with social determinants of health (SDOH) and health disparities. *For example*, clients who belong to marginalized groups often face higher rates of disease, limited access to health care, and poorer health outcomes than privileged individuals (Brown & White, 2020). Nurses need to be aware of these disparities and work toward mitigating them through advocacy, culturally competent care, and addressing SDOH. [Social Determinants Affecting Health Outcomes](#) provides a more in-depth discussion of SDOH.

To grasp the concept of privilege, it is crucial to differentiate between the agent and target groups. The **agent group** refers to those who hold a dominant social status either by birth or acquisition and may knowingly or unknowingly take advantage of their position over the target group. The **target group**, on the other hand, includes individuals belonging to social identity groups who experience discrimination, marginalization, oppression, or exploitation at the hands of the agent and the institutionalized system that they represent (Garran et al., 2020).

Systemic oppression has distinct features, one of which is the dominant group's ability to impose their version of reality and dictate what is considered normal, authentic, and right. The target group's culture, history, and language are often misrepresented or dismissed, while the dominant cultures are enforced. This type of oppression takes many forms, such as racism, sexism, ableism, and ageism, and is present at all levels of society, contributing to systemic injustices and unequal power dynamics. These forms of oppression can be deeply ingrained in cultural norms, institutions, policies, and practices, resulting in marginalization, discrimination, and disadvantage for certain

groups of people (Garren et al., 2020). See [Structural Racism and Systemic Inequities](#) for more information.

Discrimination and unequal treatment can arise from stereotypes and prejudice based on characteristics such as race, gender, disability, age, and more. Additionally, societal norms can perpetuate oppressive systems like gender roles or hierarchical power structures that limit opportunities for marginalized groups. Institutional biases also exist in policies, procedures, hiring practices, and decision-making processes, leading to unequal outcomes for individuals and communities who face discrimination. [Table 25.3](#) depicts target groups that experience discrimination, marginalization, oppression, or exploitation by the agent by types of oppression (Garren et al., 2020).

Type of Oppression	Target Group	Agent
Racial	BIPOC (Black, Indigenous, and People of Color)	White People
Religion	Non-Christian	Christian
Class	Working Class	Middle and Upper Class
Gender	Women, Transgender People	Men, Anti-Transgender
Sexual Orientation	Lesbian, Gay, Bisexual, Queer, Pansexual People	Heterosexual People
Ability	People with Disabilities	People without Disabilities
Age	People over Age 65	Young People
Immigrant Status	Immigrant	U.S. Born
Language	Non-English Speaking	English Speaking

TABLE 25.3 Examples of Oppression, Target Groups, and Agents in the United States Today (Adapted from University of Southern California, 2020.)

Privilege exists within and perpetuates the framework of systemic inequalities and historical injustices. It can vary in type and degree depending on an individual's identity and life circumstances. Acknowledging and comprehending privilege is crucial for addressing disparities and promoting social equity (Johnson, 2020).

Nurses have access to various assessment tools that can help them better understand their privilege and how it affects their interactions with others. For example, the Privilege Checklist lists different privileges associated with various social identities. By reflecting on these statements, individuals can recognize the privileges they may possess based on their social identities. In addition, the Privilege and Responsibility Curricular Exercise (PRCE) offers a hands-on learning experience that encourages participants to reflect on their own privileges, consider the responsibilities that come with those privileges, and develop a deeper awareness of the impact of privilege on individuals and communities. This tool guides participants through a process that promotes critical thinking, self-reflection, and open dialogue (Matthews et al., 2020).

Acknowledging one's privilege and being mindful of its influence are critical to fostering empathy, understanding, and promoting social justice. Recognizing privilege does not diminish an individual's struggles or challenges but addresses systemic inequities and creates a more equitable and inclusive society. When discussing privilege, it is essential to ask questions that prompt self-reflection, foster awareness, and promote a deeper understanding of how privilege operates in society.

Nurses can use their professional status to promote health equity and address health care disparities by advocating for policies and practices. They can collaborate with community organizations and policymakers to address social determinants of health, improve access to health care services in underserved areas, and support community health initiatives. Nurses can also advocate for language access services, like interpreter services and translated health care materials, to enable clients with limited English proficiency to understand and participate in care.

One way for nurses to tackle privilege-based issues is to focus on improving health literacy. As discussed in [Culturally and Linguistically Responsive Nursing Care](#), health literacy refers to an individual's ability to obtain, comprehend, assess, and apply health-related information to make informed decisions about their well-being and health care. It encompasses various skills related to health information and activities, such as reading, writing, numeracy, communication, and critical thinking (Institute of Medicine (US) Committee on Health Literacy, 2021). By tailoring health education materials and resources to the client's health literacy level, nurses can ensure that

everyone can access relevant and easily comprehensible information, regardless of socioeconomic status or educational background. Addressing health literacy empowers clients to take charge of their health and make informed choices about their health care (Frosch, 2020; Trachtenberg et al., 2021).

As a nurse, it is essential to reflect on one's privileges, comprehend how they contribute to health care disparities, and actively strive to provide fair and equitable care to all clients.

Identifying Areas for Growth and Development

Self-assessment improves a nurse's ability to provide culturally and linguistically competent care by identifying areas of growth and strengths.

As a nurse, it is essential to possess the knowledge and awareness of different cultures to provide appropriate care. This includes understanding customs, traditions, languages, family structures, religious practices, and health care beliefs. While one cannot be an expert on every cultural nuance, learning about the cultural groups in the community or client population being served is a crucial aspect of providing culturally responsive care.

When interacting with individuals from different cultures, it can be useful to categorize them based on their cultural traits. [Cultural Influences on Health Beliefs and Practices](#) discusses how cultural generalizations can provide a foundation for understanding and anticipating what to expect when interacting with individuals from a specific culture. These generalizations play a role in intercultural communication, helping nurses comprehend new experiences and information. However, generalizations should not be applied to every person within a cultural group and should not be confused with cultural stereotypes. Unlike stereotypes, which are fixed and often negative, generalizations are flexible and can change as new information is integrated. Generalizing about cultural groups can help nurses determine which questions to ask and provide a starting point to understand the extent to which the client adheres to cultural characteristics. To manage cultural differences effectively, nurses must cultivate skills in differentiating between generalizations and stereotypes ([Figure 25.5](#)).

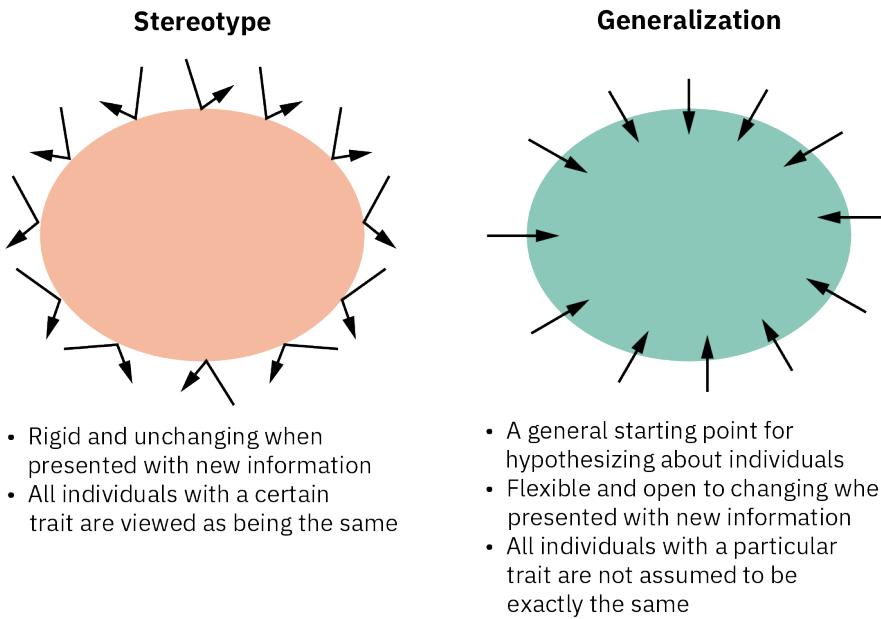

FIGURE 25.5 When projecting inward, generalizations may involve reflecting on one's own cultural background and recognizing common patterns or values. The use of stereotypes in projecting outward involves applying fixed beliefs to individuals from a particular culture without considering their unique qualities. This can lead to unfair judgments and discriminatory behavior. Conversely, projection inward with stereotypes involves accepting and internalizing biased beliefs about one's own culture, which can lead to self-limiting beliefs and internalized prejudices. (attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

To become culturally aware, one must also recognize and acknowledge their culture, experiences, feelings, thoughts, and surroundings without imposing them on others from different backgrounds. As defined by Purnell (2005), cultural self-awareness involves a deliberate and conscious process of understanding oneself, including personality, values, beliefs, professional knowledge standards, and ethics, and how these factors impact interactions with individuals from diverse backgrounds. Suggestions within this chapter that focus on promoting cultural self-awareness include practicing mindfulness, cultivating cultural humility, evaluating one's cultural

identity, and creating an inventory of one's cultural background. [Cultural Influences on Health Beliefs and Practices](#) provides additional information on the utilization of assessment tools to measure cultural competence.

Remember Sarah? She was initially confident in her ability to provide culturally appropriate care when she joined the public health department. However, during the first few weeks, she had several encounters with clients who had views and health practices that differed from her own, making her realize she needed to become more aware of the cultural groups her agency served.

After assessing her cultural knowledge and skills, Sarah recognized she was unfamiliar with Vietnamese culture and expressed a desire to learn more about its customs and traditions. As a result, Sarah set goals to understand cultural norms concerning health beliefs, family involvement, and communication styles. She participated in cultural competency workshops and welcomed feedback from her colleagues to improve her understanding of the diverse cultures in the public health service region. Additionally, Sarah engaged in self-reflection to identify and challenge her own biases and stereotypes about Vietnamese culture. She consciously tried to suspend judgment and assumptions based on cultural differences, recognizing that cultural humility requires a willingness to confront and overcome personal biases.

SARAH DEMONSTRATES PROVIDING CLIENT-CENTERED CARE

One day, Sarah attends to Mrs. Nguyen, an older client who appears hesitant and reserved. Sarah recognizes the importance of cultural humility in providing client-focused care and takes the necessary steps to demonstrate it.

Respectful and open communication:

Sarah approaches Mrs. Nguyen with a warm smile and greets her using a respectful greeting in Vietnamese, such as “Xin chào.” Sarah learns that Mrs. Nguyen is fluent in English and will not require the services of a medical interpreter. Nevertheless, she uses simple, straightforward language to communicate with Mrs. Nguyen, avoiding medical jargon and ensuring that Mrs. Nguyen understands the information she shares.

Active listening and valuing the client's perspective:

Sarah takes the time to actively listen to Mrs. Nguyen's concerns and preferences and any cultural practices that may be important to her. She respects and values Mrs. Nguyen's perspective, allowing her to express her feelings and thoughts without interruption.

Collaborative decision making:

Sarah involves Mrs. Nguyen and her family in the decision-making process. She seeks their input and respects their autonomy and preferences. Sarah recognizes that the Nguyens are the experts in their own cultural practices and integrates their input into the client's care plan.

Adapting care practices:

Sarah modifies her care practices to align with Mrs. Nguyen's cultural preferences and needs. For example, she works with Mrs. Nguyen to create a diet plan to include traditional Vietnamese dishes that are familiar and acceptable to Mrs. Nguyen.

By becoming culturally knowledgeable and demonstrating cultural humility in her interactions with Mrs. Nguyen, Sarah ensures that she provides client-centered care that is respectful, inclusive, and responsive to Mrs. Nguyen's cultural background and needs. Sarah's actions foster trust, promote effective communication, and contribute to a positive health care experience for her client.

25.3 Managing Conflict

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 25.3.1 Recognize the many forms that biases and stereotypes can take.
- 25.3.2 Analyze factors contributing to conflicts arising from differences in values, beliefs, communication styles, and expectations.
- 25.3.3 Apply strategies and methodologies to effectively confront biases resulting from one's cultural and social identity.
- 25.3.4 Differentiate between emotional intelligence (EI) and cultural intelligence (CQ).
- 25.3.5 Explain how emotional intelligence (EI) and cultural intelligence (CQ) contribute to conflict resolution in diverse health care environments.
- 25.3.6 Describe the effects of power imbalances on nurse-client relationships in health care while distinguishing between different power dynamics.
- 25.3.7 Identify client-centered strategies to mitigate power imbalances and promote equitable and client-centered care.
- 25.3.8 Apply mindful practices to enhance cultural competence in health care interactions.

In nursing practice, cultural diversity can sometimes cause conflict between health care providers and clients who come from different cultural backgrounds. This is often due to differences in values, beliefs, communication styles, and expectations. Such conflicts can have a negative impact on client care and communication, as well as overall health care outcomes. Effective communication, empathy, cultural understanding, and a commitment to respectful resolution are necessary to manage conflicts that arise from cultural diversity. It is essential to address both conscious and unconscious biases, which can help to reduce stereotypes and assumptions. By continuously striving to be culturally responsive, health care providers can achieve better client outcomes, higher levels of client satisfaction, and improved overall health care quality.

Confronting Biases

As discussed in [Culturally and Linguistically Responsive Nursing Care](#), implicit biases can lead individuals to unknowingly treat people from certain groups differently based on their race, gender, sexual orientation, or other characteristics. Implicit biases can affect health care outcomes, resulting in disparities in treatment and client experiences (Belton et al., 2018). Providers' implicit biases may also play a role in causing racial health disparities (FitzGerald & Hurst, 2017), and clinical decision making can be influenced by these biases (Hoffman et al., 2016).

Health care professionals, including nurses, have demonstrated unconscious biases toward clients based on irrelevant characteristics such as weight, mental health, clients with AIDS, clients with brain injuries who may have contributed to their injury, clients who are intravenous drug users, and clients with disabilities, in addition to race, ethnicity, gender, socioeconomic status, and age. These biases can affect the care provided to these individuals and contribute to health disparities (FitzGerald & Hurst, 2017). Unconscious processes may affect judgments, negatively impacting the nurse-client relationship and compromising client care (Greenwald et al., 2022). [Table 25.4](#) presents examples of common forms of bias that may be either implicit or explicit.

Type of Bias	Definition	Implications in Health Care
Gender	The differential treatment, attitudes, and expectations toward individuals based on their gender, leading to unequal opportunities and outcomes	Can manifest in various ways, affecting client care, medical research, and career opportunities for health care professionals (Piercey & Fletcher, 2020). For example, studies have shown that women are often undertreated for their pain, wait longer to receive a diagnosis or treatment, and are less likely to be the subjects of research studies. Gender bias also affects women's reproductive health, and the stigma associated with sexual assault may lead women to avoid seeking care following an attack (Concern Worldwide US, 2022).
Age (ageism)	Discrimination or stereotyping of individuals based on age, either old or young	Older individuals may face challenges accessing appropriate health care due to age-related stereotypes and assumptions. Health care providers might attribute specific symptoms to aging rather than considering underlying medical conditions, leading to delayed diagnoses, inadequate care, and a lack of attention to the unique health care needs of older clients (Levy & Macdonald, 2020).
Weight	Involves negative attitudes and stereotypes toward individuals based on their weight or size	Health care providers may hold prejudiced beliefs about clients with obesity, leading to substandard care, misdiagnoses, or stigmatization. Clients with obesity may receive incomplete assessments, and their health concerns may be attributed solely to their weight rather than addressing underlying medical issues (Puhl & Suh, 2020).
Socioeconomic	Differential treatment based on an individual's economic status or social class	Clients from lower socioeconomic backgrounds may face barriers to accessing health care services and may receive less personalized care than those with higher socioeconomic status. Socioeconomic bias can also result in disparities in health care quality and health outcomes (Hohl et al., 2020).
Disability	Prejudices and discrimination against individuals with disabilities	Health care providers and settings may not fully accommodate the needs of clients with disabilities. Inadequate communication, inaccessible facilities, and a lack of consideration for the specific challenges this population faces in seeking and receiving health care services lead to disparities in health care access and outcomes (McMahon et al., 2020).
Sexual orientation, also known as LGBTQ+ (lesbian, gay, bisexual, transgender, and queer/questioning) bias	Discrimination or prejudices against individuals based on their sexual orientation or gender identity	This bias can affect access to health care services, health insurance, quality of care, and nurse-provider communication for LGBTQ+ individuals (National LGBTQIA+ Health Education Center, 2020; MAP, 2023a). Bias also includes heteronormative assumptions that clients are cisgender or heterosexual.

TABLE 25.4 Common Forms of Bias with Examples

Addressing biases is a critical aspect of providing client-centered care for nurses. Negative impacts such as unequal treatment, misdiagnosis, and reduced client trust can be avoided by addressing biases. Nurses can achieve this by increasing their self-awareness, being culturally responsive, and adopting humility through education. By doing so, they can provide equitable care that respects clients' diverse backgrounds and needs.

BECOMING SELF-AWARE OF UNCONSCIOUS BIAS

As described in [Culturally and Linguistically Responsive Nursing Care](#), the Implicit Association Test (IAT) can help the nurse become more self-aware and reflect on any implicit biases they may have related to gender, race, age, or other social categories.

Select an [Implicit Association Test \(<https://openstax.org/r/implicit>\)](https://openstax.org/r/implicit) (IAT) from a list of possible topics. Complete the assessment. Reflect on the findings, and then respond to the following questions.

1. Are there any discrepancies between your explicit beliefs and the implicit biases indicated by the test?
2. What actions could you take to address biases?

Maintaining a balance between personal and professional obligations is crucial for nurses to avoid client misunderstandings. Self-awareness plays a vital role in reducing biases. Having cultural sensitivity is important in reducing biases and promoting inclusivity. As a nurse, it is important to appreciate diversity in all forms and recognize that cultural differences enrich society and provide opportunities for learning and growth. Respectfully celebrating cultural practices, holidays, and traditions without appropriating or trivializing them is essential to fostering inclusivity, mutual respect, and understanding among diverse cultural groups.

To recognize and mitigate the impact of implicit biases, nurses must make a conscious effort to challenge them. Nurses must redirect their responses and counteract implicit biases when dealing with individual interactions. Recognizing one's implicit biases requires self-reflection, observation, and a willingness to confront and examine one's thoughts and beliefs. Nurses can prevent conflicts, promote effective communication, and prioritize client well-being by addressing personal biases.

Strategies to mitigate unconscious biases typically include training programs that increase awareness of personal beliefs, implicit attitudes, and stereotypes (Schmader et al., 2022). Identifying contexts that may lead to bias expression and creating plans to regulate behavior actively are also essential. Similarly, interventions to reduce unintentional biases involve effectively training individuals to regulate their beliefs, implicit attitudes, and stereotypes. Examples of strategies to reduce biases are presented in [Table 25.5](#).

Strategy	Description
Stereotype replacement	<ul style="list-style-type: none"> • Consciously challenging and replacing stereotypical beliefs and assumptions with more accurate and nuanced understandings • Actively recognizing and questioning stereotypes and replacing them with diverse, individualized perceptions
Counter-stereotypic imaging	<ul style="list-style-type: none"> • Deliberately representing individuals or groups in a way that challenges or counters traditional stereotypes associated with them • This action helps the nurse to break away from stereotypical portrayals, challenge biases, promote inclusivity, and encourage more accurate perceptions.
Evaluative conditioning	<ul style="list-style-type: none"> • Repeatedly pairing a target stimulus (the one for which the attitude change is desired) with positive or negative stimuli to influence or modify attitudes or evaluations toward the target stimulus • Repeated pairing links emotional response to target stimulus with associated stimulus. Evaluative conditioning creates positive associations to combat negative biases and stereotypes.
Individuation	<ul style="list-style-type: none"> • Seeing individuals as unique and distinct rather than as part of a broad category or stereotype • This action helps nurses recognize and appreciate people's individuality, complexity, and diversity and can help replace biases and promote a more accurate understanding of others.

TABLE 25.5 Strategies to Mitigate Biases (See Devine et al., 2012; FitzGerald et al., 2019.)

Strategy	Description
Perspective taking	<ul style="list-style-type: none"> • Empathizing with others to comprehend their thoughts, emotions, and experiences • Helps minimize biases, develop empathy, and foster mutual understanding
Identifying self with the outgroup	<ul style="list-style-type: none"> • Participating in tasks that lessen barriers between oneself and others • Finding commonalities and shared identities with people from different social or cultural backgrounds can reduce biases and promote empathy, understanding, and a greater sense of connectedness.
Cultural immersion and engagement	<ul style="list-style-type: none"> • Proactively engaging with people from diverse racial, ethnic, gender, and sexual orientation groups through various means, such as participating in cultural events, traveling to a different country, living in a culturally diverse community, or forming meaningful relationships with individuals from that culture • Deepens one's understanding of a culture beyond surface interactions

TABLE 25.5 Strategies to Mitigate Biases (See Devine et al., 2012; FitzGerald et al., 2019.)

Recall that Sarah, a home health nurse, has been assigned to conduct a home visit for a new client, Mr. Ramirez, who recently relocated to the community from a Latin American country. Arriving at Mr. Ramirez's residence, Sarah observes the neighborhood and senses a subtle discomfort within herself. Unbeknownst to her, this discomfort is driven by implicit biases that influence her perceptions and attitudes. During the visit, Sarah unintentionally makes assumptions about Mr. Ramirez's health practices, family dynamics, and overall lifestyle based on her own cultural background and preconceived notions. These biases may manifest subtly, such as in nonverbal cues or unintentional microaggressions, impacting the quality of care and communication.

SARAH'S STEPS TO REDUCE THE IMPACT OF HER IMPLICIT BIASES

Sarah reflects on her interactions with Mr. Ramirez and becomes aware of the implicit biases that may have influenced her perceptions. Recognizing the need to address these biases to provide culturally congruent care, Sarah undergoes training and education to increase her cultural awareness and seeks guidance from her supervisor on strategies to overcome implicit biases.

Self-awareness and reflection:

- Sarah acknowledges her reaction to her client's neighborhood and reflects on her biases and assumptions.
- She recognizes that her biases can influence her interactions and decisions and commits to addressing them.

Cultural sensitivity:

- Sarah engages in ongoing education and training to enhance her cultural responsiveness and sensitivity.
- She seeks to understand the experiences, values, and beliefs of the diverse population she serves. This includes learning about the cultural practices, health care beliefs, and community resources relevant to the Latin American community.

Building rapport and trust:

- Sarah focuses on building rapport and trust with Mr. Ramirez and other community members.
- She recognizes that establishing a respectful and trusting relationship is essential for effective communication and engagement. She actively listens to their concerns, values their perspectives, and involves them in their health care decisions.

Challenging stereotypes and assumptions:

- Sarah consciously challenges stereotypes and assumptions she may have about individuals from different cultures or backgrounds. She reminds herself that each person is unique, with their own strengths, challenges, and aspirations.

- She avoids making assumptions based on external factors, such as neighborhood appearance or socioeconomic status.

Seeking diverse perspectives:

- Sarah actively seeks opportunities to engage with members of the Latin American community and learn from their experiences.
- She attends community events, participates in cultural celebrations, and seeks input from community leaders to better understand their needs, values, and concerns.

Reflective practice and continuous learning:

- Sarah regularly reflects on her experiences and interactions with the community to identify any moments where implicit biases may have influenced her actions or decisions.
- She self-reflects, accepts feedback, and commits to continuous learning and improvement.

Sarah's actions reflect her commitment to providing equitable and culturally sensitive care to the community. She acknowledges the potential impact of her implicit biases on health care delivery and tries to overcome them. Sarah prioritizes self-awareness, cultural competence, collaboration, and reflection to provide unbiased care that respects her client's needs and values.

Emotional and Cultural Intelligence

Emotional and cultural intelligence are essential in managing cultural conflicts in nursing practice. Understanding emotional intelligence (EI) and cultural intelligence (CQ) is crucial for effectively navigating interactions and relationships, particularly in diverse and multicultural environments. Although they have some similarities, they are separate concepts that deal with different aspects of human behavior and interpersonal abilities.

Emotional intelligence (EI) refers to the ability to recognize, understand, and manage one's emotions and the emotions of others effectively. Daniel Goleman coined the term in his 1995 book *Emotional Intelligence: Why It Can Matter More Than IQ*, where he introduced EI's significance in personal and professional success. Goleman argues that traditional measures of intelligence, such as IQ (intelligence quotient), do not fully predict a person's success in life. EI involves several key components (Goleman, 1995):

- **Self-awareness:** The ability to recognize and understand one's emotions, strengths, weaknesses, and values
- **Self-management:** The capacity to manage and regulate one's emotions, impulses, and behaviors
- **Motivation:** Harnessing emotions to drive and sustain motivation, set, and achieve goals
- **Empathy:** The ability to understand and share the feelings and perspectives of others, demonstrating sensitivity and compassion
- **Social skills:** Proficiency in building and maintaining positive relationships, effective communication, conflict resolution, and teamwork

EMOTIONAL INTELLIGENCE (EI) TEST

This Emotional Intelligence Test from the Global Leadership Foundation consists of 40 questions derived from the Global *EI Capability Assessment* instrument and is based on Goleman's four-quadrant Emotional Intelligence Competency Model (2002). You may use your test results as a guide to assess areas where you are doing well and others you may need to develop further. The test generally takes 10 minutes.

1. Take the [Emotional Intelligence Test \(<https://openstax.org/r/eitest>\)](https://openstax.org/r/eitest).
2. Click on the Score Test button, and wait for the computer to generate an EI profile of your scores.
3. Reflect on the capability level within each of the EI quadrants.
4. Discuss how EI can contribute positively to promoting cultural humility.

Emotional intelligence (EI) aids individuals in managing stress, navigating social interactions, and making sound decisions. In various fields, such as leadership, management, and health care, emotional intelligence is vital in establishing solid relationships, motivating others, and resolving conflicts.

Developing **cultural intelligence** (CQ) is another means for addressing cultural conflicts in nursing practice. In *Cultural Intelligence: Individual Interactions Across Cultures*, Earley and Ang (2003) define cultural intelligence as the ability to adapt and interact effectively with people from different cultural backgrounds. It involves having knowledge, awareness, and skills related to cultural diversity. The components of cultural intelligence include:

- **Cultural knowledge:** Understanding of norms, values, beliefs, and practices of different cultural groups
- **Cultural understanding:** Unbiased recognition and appreciation of cultural differences and similarities
- **Cultural skills:** Interpersonal and communication skills to effectively interact and communicate across cultures
- **Cultural adaptability:** Willingness and ability to adjust one's behaviors, attitudes, and beliefs to fit into different cultural contexts

Cultural intelligence enables individuals to navigate diverse settings, foster inclusive relationships, and avoid misunderstandings or conflicts stemming from cultural differences. As health care professionals, nurses must regularly reflect on their emotional and cultural intelligence to identify their strengths and areas for growth in providing culturally competent care.

To assess their emotional and cultural intelligence, nurses can use the following techniques:

1. Consider taking an emotional intelligence assessment to identify personal strengths and areas for growth.
2. Reflect on emotional reactions in various social situations, including the workplace, mainly when dealing with colleagues and clients. Analyze how emotions may impact decision making and interactions with others.
3. Seek feedback to gain insight into how one is perceived regarding emotional and cultural intelligence. This can help nurses identify their **blind spots**, or unconscious or implicit biases they are unaware of (Banaji & Greenwald, 2016). Blind spots can influence a person's perceptions, judgments, and decision making without their conscious knowledge or intention. They are often formed and reinforced by societal norms, cultural influences, personal experiences, and media portrayals.
4. Observe interactions with others to identify how one responds to situations that involve cultural differences. Consider how interactions may reflect one's level of cultural intelligence.
5. Engage in continuous education to improve emotional and cultural intelligence. This can include reading books or articles, attending cultural competency workshops, or seeking mentorship from colleagues skilled in providing culturally responsive care.
6. Use self-reflection to identify personal cultural biases and beliefs. Then, consider how one's cultural background may influence interactions with clients and colleagues from different cultural backgrounds.

Emotional and cultural intelligence enable empathy and comprehension and promote effective communication when interacting with people from cultures that are different from one's own. With these skills, nurses can foster inclusive and harmonious interactions in personal and professional settings. EI equips nurses to manage conflicts constructively, while CI enhances their capacity to navigate disputes arising from cultural differences. EI and CI enable nurses to manage misunderstandings, bridge cultural gaps, and establish positive relationships across cultures. Conflict resolution and relationship building are essential to cultural competency, as they foster collaboration, trust, and mutual respect in culturally diverse environments.

Addressing Power Imbalances

In nursing, **power imbalances** can create conflicts and hinder effective communication between health care providers and between providers and clients. Imbalances can arise in the nurse-client relationship due to differing roles, knowledge, and authority (Foronda, 2019; Foronda et al., 2016). For example, nurses may perceive themselves as having more power than their clients due to their professional knowledge and authority, while clients often feel a sense of vulnerability and dependence on the health care system (Karim, 2023). Addressing these imbalances is essential for promoting client autonomy and improving outcomes.

In health care organizations, nurses hold varying levels of authority and responsibility compared to clients. This hierarchical structure can impact communication patterns and make clients feel subordinate. Nurses often have decision-making authority in health care settings, which can limit client autonomy and control over their own health care decisions. How power is distributed affects how nurses and clients communicate and make decisions. For example, clients may feel uncomfortable sharing their concerns or preferences because they worry about upsetting

or questioning the nurse's authority. Meanwhile, nurses may find it challenging to balance empowering clients and maintaining control over the care process (Karim, 2023). When power is used in an authoritarian manner, clients may feel disempowered and less trusting of the health care system (Karim, 2023). Cultural context can also play a role in shaping power dynamics within nurse-client interactions. In some cultures, clients may defer to the authority of health care professionals, leading to a more pronounced power imbalance (Karim, 2023).

To provide client-centered care, nurses should engage clients in shared decision making, honor their preferences and values, and offer the information they need to make informed choices about their care ([Figure 25.6](#)). When nurses advocate for client involvement in decision making and respect their autonomy, it increases client trust and satisfaction (Ringdal et al., 2017). Advocacy and autonomy are principles in the Nursing Code of Ethics (ANA, 2015). Advocacy ensures that clients' voices are heard, their rights are respected, and their needs are met. Autonomy empowers clients to actively participate in their health care decisions, giving them a sense of ownership and control over their well-being. These principles are the foundation of client-centered care and ethical nursing practice.

FIGURE 25.6 To provide client-centered care, nurses should engage clients in shared decision making, respect their preferences and values, and provide them with the information they need to make informed choices about their care. (credit: "A Navy nurse speaks to a woman about medications aboard USNS Comfort (T-AH 20)" by Morgan K. Nall/U.S. Navy/Flickr, CC BY 2.0)

To create a safe and respectful environment, nurses should promote open and respectful communication, actively listen to clients, and encourage them to voice their concerns and preferences without fear of judgment or retribution. To empower clients and promote participation in their care, nurses should strive to create a trusting and supportive environment where clients feel comfortable expressing their needs and preferences (Ringdal et al., 2017). Addressing power imbalances requires nurses to adopt a client-centered approach, promoting partnership and collaboration rather than paternalistic attitudes. Here are some strategies nurses can implement:

- Practice cultural humility and respect clients' unique perspectives and values (Foronda, 2019).
- Foster open and honest communication, ensuring clients feel comfortable asking questions and expressing their concerns (Ringdal et al., 2017).
- Allow clients to have a voice and actively involve them in shared decision-making processes (Molina-Mula et al., 2020), providing them with information and options to make informed choices about their care (Ringdal et al., 2017).
- Engage in relationships that support clients' health care preferences (Pelletier & Stichler, 2014).
- Advocate for client rights and autonomy within the health care system (Molina-Mula et al., 2020).
- Continuously reflect on one's power and privilege and work toward mitigating the impact of power imbalances in the nurse-client relationship.

Cases where power and resources are unevenly distributed can result in health inequalities (National Academies of Sciences, Engineering, and Medicine, 2017). Nurses can tackle power imbalances and encourage care by prioritizing the client, leading to more autonomy and a fairer and more empowering health care setting.

Engaging in Mindful Awareness

Understanding the connection between mindful awareness and cultural humility is essential for creating culturally sensitive interactions in different situations, especially in health care settings. These concepts can help nurses better appreciate cultural diversity and provide client-centered care. **Mindful awareness** means being present in the moment and observing thoughts, emotions, and sensations without judgment. Being consciously or mindfully aware and receptive in the context of cultural responsiveness means actively and intentionally seeking to understand, respect, and appreciate the diverse cultural backgrounds, perspectives, and practices of individuals and communities. It involves recognizing the influence of culture on people's behaviors, values, beliefs, and norms, consciously bridging cultural gaps, and fostering inclusive interactions.

To cultivate mindful awareness, nurses can actively engage in several practices:

- **Mindful Listening:** Practice active listening by entirely focusing on the speaker. Seek to understand the speaker's perspective without interrupting or judging prematurely.
- **Suspension of Judgment:** Be aware of automatic judgments and biases that arise and consciously set them aside. Instead, aim to understand the reasoning behind different viewpoints before forming an opinion.
- **Empathy and Perspective Taking:** To gain a better understanding of someone's experiences, emotions, and motivations, try to adopt their perspective. Cultivate empathy by imagining oneself in the same circumstances.
- **Continuous Learning:** Foster a growth mindset, and embrace a lifelong learning attitude. Seek new information, engage in diverse experiences, and be open to changing personal beliefs based on new evidence or insights.
- **Reflection and Self-Awareness:** Regularly reflecting on thoughts, biases, and reactions helps develop self-awareness of times when one may resist new information.

Practicing mindfulness can benefit everyone involved, including clients, professionals, and personal well-being. ANA's Scope and Standards of Practice acknowledges the significance of mindfulness in nursing practice, emphasizing the need for nurses to "practice with presence, intention, and focused attention" to enhance client-centered care and promote a culture of safety (ANA, 2020, p. 10). This requires nurses to possess a heightened self-awareness to cultivate an authentic presence. This means being attuned to their own thoughts, emotions, and reactions as they engage with clients, colleagues, and various clinical situations. Being fully present involves acknowledging and managing distractions that might hinder effective communication or decision making. This concept goes beyond the nurse's physical presence—it requires being mentally present, actively listening, and responding empathetically to clients' needs and concerns. This requires the nurse to have the skill set to adapt their behavior according to their self-awareness and situational awareness. Nurses can employ practical tools to cultivate compassionate habits that support well-being, communication, resilience, and success. These mindfulness practices are not just quick fixes for stress; they can serve as a solid foundation for developing more empathetic nursing practice. Mindfulness practice can enhance engagement, a sense of purpose, and the ability to manage difficult client conversations while fostering empathy (Bertin, 2020; Mindful Communications, n.d.).

MINDFUL BREATHING: PRACTICING SELF-CARE

[Access multimedia content \(<https://openstax.org/books/population-health/pages/25-3-managing-conflict>\)](https://openstax.org/books/population-health/pages/25-3-managing-conflict)

Mindful breathing, or intentionally focusing on each inhalation and exhalation, can help increase muscle relaxation and improve sleep and overall mental health and well-being. This video guides the viewer through a short exercise in this technique.

Play the video, complete the exercise, and then respond to the following questions.

1. How can the practice of taking seven mindful breaths, following the rhythm of inhaling, and exhaling on one, help individuals improve their overall health and well-being?
2. How might incorporating the practice of taking seven mindful breaths in moments of crisis or before

challenging situations contribute to building stronger interpersonal relationships and fostering a more compassionate society?

3. How does grounding oneself through mindful breathing practice align with the goal of mindful communications to promote healthier and more mindful ways of interacting with oneself and others?

Mindfulness in nursing practice can equip nurses to better manage the challenges of caring for clients from diverse cultural backgrounds. Mindfulness practices can enhance emotional intelligence and empathy (Brewer et al., 2019). Integrating mindfulness into cultural care delivery can help health care providers better comprehend and address the psychological aspects of clients' experiences related to their cultural background (Zandbelt et al., 2017).

By practicing mindfulness, nurses can gain a deeper understanding of their own biases and assumptions. This promotes the nurse's ability to approach client interactions with openness and sensitivity to cultural differences. Nurses can adapt their care strategies and communication styles to meet the unique needs of clients from diverse backgrounds by heightening awareness of cultural variations.

For example, Sarah, the newly hired nurse from the previous examples, is passionate about delivering quality care to her clients. She is keenly aware of the importance of cultural humility but feels overwhelmed by her clients' diverse cultural backgrounds. Struggling to bridge cultural gaps and foster inclusivity, Sarah embarks on a journey to integrate mindfulness principles into her nursing practice.

Sarah started practicing mindful awareness during client interactions. She observes her thoughts, emotions, and assumptions without judgment, allowing her to gain insight into her biases. Utilizing mindfulness practices, Sarah focuses on cultivating emotional intelligence. This involves understanding her emotions and those of her clients, fostering a deeper connection. Sarah extends mindfulness to comprehend the psychological aspects of clients' experiences related to their cultural background. This helps her address the unique emotional needs of each client. As Sarah integrates mindfulness into her nursing practice, she experiences transformative outcomes. Mindfulness allows Sarah to gain a deeper understanding of her biases and assumptions. This self-awareness becomes the foundation for her approach to client interactions. Sarah's mindfulness practices promote openness and sensitivity to cultural differences. She learns to approach each client nonjudgmentally, fostering trust and mutual respect. Heightened awareness of cultural variations empowers Sarah to adapt her care strategies and communication styles. She tailors interventions to meet the unique needs of clients from diverse backgrounds. Sarah's case illustrates the transformative power of integrating mindfulness into nursing practice, particularly in cultural humility and competency, through mindful awareness, emotional intelligence, and a commitment to ongoing learning.

Mindfulness is a practice that teaches personal growth as a never-ending journey. Sarah understands that becoming culturally responsive is a continuous process that requires constant learning and adaptation and encourages humility in approaching different cultures. Being present in the moment allows nurses to engage with their clients fully. This is crucial in understanding subtle cues, nonverbal communication, and nuances that may carry cultural significance, resulting in increased cultural sensitivity. Mindfulness helps to cultivate an open-minded approach to every client interaction, enabling nurses to approach situations with curiosity instead of preconceived notions and creating an environment that values and respects diverse perspectives.

25.4 Creating an Atmosphere of Trust and Mutual Respect

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 25.4.1 Describe factors that lead to mistrust of the U.S. health care system.
- 25.4.2 Identify strategies to promote trust in the U.S. health care system.
- 25.4.3 Establish goals that encourage cultural responsiveness and humility.
- 25.4.4 Engage in regular self-reflection to actively challenge and unlearn biases.

The level of trust that different groups have in the health care system differs. Factors that can contribute to this variance include historical experiences, cultural beliefs, socioeconomic status, language barriers, and access to health care. Historical experiences of discrimination, mistreatment, or disparities in health care can significantly impact an individual's or a community's trust in the health care system.

Factors Influencing Trust of the Health Care System

As discussed in [Structural Racism and Systemic Inequities](#), certain cultural groups have experienced systemic injustices, leading to mistrust of the U.S. health care system. For instance, from 1932 to 1972, the U.S. Public Health Service conducted the Tuskegee Syphilis Study, deliberately misleading Black men about its purpose and withholding penicillin from them when it became available as a treatment. The study had a lasting impact on the Black community's trust in health care providers and the health care system (CDC, 2022; Freimuth et al., 2001).

Negative stereotypes about certain groups of people have led these groups to mistrust government and institutions. For instance, those living in rural areas with low incomes have been stigmatized since the earliest colonial times. At that time, poor White colonists were viewed as unwanted vagrants who were not entitled to their rights and dignity as American citizens. Rural communities tend to be more skeptical of government and institutions. This is largely because these communities face numerous challenges in obtaining affordable, timely, and quality health care services. Such obstacles often stem from financial limitations, transportation issues, and differences in the quality of health care provided (Rural Health Information Hub, 2022).

Members of the LGBTQ+ community have also been subject to high rates of health care discrimination historically, ranging from harassment and humiliation to being turned away for care. For example, although the Affordable Care Act prohibits discrimination on the basis of sex, including pregnancy, sexual orientation, gender identity, and sex characteristics by federally funded health care providers (U.S. Department of Health and Human Services, 2021), nine U.S. states have laws that allow medical professionals to decline service to LGBTQ+ clients based on religious beliefs (Movement Advancement Project [MAP], 2023b). In 2023, 15 U.S. states banned some forms of best practice medical care for transgender youth, and nine states banned Medicaid from providing coverage for medically necessary health care for all transgender individuals (MAP, 2023a).

Other factors that result in clients' distrust of the health care system include:

- The impact of cultural beliefs and values surrounding health and healing practices and how they affect an individual's trust in the system. Certain cultural groups have traditional or spiritual healing practices that may not align with Western medicine, and it is crucial to respect and acknowledge these beliefs to establish trust.
- Communication difficulties and language barriers. Limited proficiency in the dominant language can make it difficult for individuals from specific cultural groups to effectively express their health concerns, understand medical information, or build rapport with health care providers.
- A lack of diversity and representation in the health care workforce hurts trust. When individuals from specific cultural groups do not see health care providers who share their cultural background or resemble them, it can lead to mistrust and a feeling of being misunderstood or disrespected.

Fostering Trust Through Cultural Responsiveness

Eradicating stereotypes and negative perceptions toward certain groups is a necessary step in establishing community trust in the health care industry. This can be achieved when nurses and other health care providers display an understanding of and respect for diverse cultural practices, beliefs, values, and ways of life. Doing so can enhance trust and strengthen the relationship between clients and health care providers.

To promote trust, the nurse can:

- Take steps to learn about the populations they serve (Association of Public Health Nursing [APHN], n.d.).
- Advocate for a workforce that reflects the diversity of the populations served (APHN, n.d.).
- Practice inclusiveness, listen to understand, and recognize the knowledge and power of each individual and group (APHN, n.d.).
- Role model and exemplify the principles of social justice (APHN, n.d.).
- Use effective communication and resolution strategies respectfully to address conflicts (APHN, n.d.).
- Establish community-engaged partnerships, including rural residents from historically marginalized groups (APHN, n.d.).
- Advocate for rural-centered health care delivery models (Lister & Joudrey, 2022).
- Practice with cultural sensitivity by developing a deep understanding of clients' cultural backgrounds and their impact on health and healing (Seeleman et al., 2015).

Community support and advocacy efforts can play an important role in building trust. When marginalized populations have community organizations, leaders, or advocates actively addressing health disparities and advocating for equitable health care, it can help foster trust and engagement with the health care system.

Recall Nurse Sarah. She is organizing a community health fair to raise awareness about preventive health measures. She wants to ensure that community members feel comfortable and trust the information and services provided at the event. The box below presents actions that Sarah initiates to create an environment of trust.

SARAH'S STEPS TO CREATE AN ENVIRONMENT OF TRUST

When organizing a community health fair, Sarah takes the following actions to create an environment of trust.

Transparent and clear communication:

Sarah shares information about the health fair, its purpose, and what community members can expect with community members and partners. She provides details about the services, workshops, and resources available and openly addresses any concerns or questions.

Cultural sensitivity and inclusivity:

Recognizing the diversity within the community, Sarah takes steps to ensure cultural sensitivity and inclusivity by involving representatives from various cultural groups in the planning process to ensure that the health fair addresses the needs and preferences of different communities. Sarah tries incorporating diverse perspectives, languages, and cultural practices into the event.

Building relationships and partnerships:

Sarah actively builds relationships with community leaders, organizations, and concerned parties. She collaborates with local community-based organizations, faith-based groups, and other agencies to establish partnerships that can enhance the credibility and reach of the health fair. Sarah engages these partners in the planning and implementation to ensure community ownership and involvement.

Active listening and empathy:

Sarah listens attentively to community members' concerns, feedback, and suggestions. She demonstrates empathy by validating their experiences and emotions. Sarah encourages open dialogue, creates a safe space for sharing, and assures community members that their voices are valued and will be considered.

Confidentiality and privacy protection:

Sarah ensures that all personal health information is treated with confidentiality. She explains to community members how their data will be managed and stored, assuring them that their information will only be used for the intended purposes and in compliance with relevant privacy laws and regulations.

Professional competence and integrity:

Sarah maintains high professional competence and integrity in her work. She stays current with the latest evidence-based practices, research, and guidelines in public health. Sarah provides accurate and reliable information, avoiding misinformation or bias that could undermine trust. She follows ethical guidelines and acts in the best interest of the community.

Sarah's actions foster an environment of trust within the public health department and its community. She prioritizes open communication, cultural sensitivity, and inclusivity while maintaining professionalism and integrity. Her efforts are instrumental in strengthening relationships, promoting community engagement, and ultimately, improving health outcomes. Such interactions build trust over time. Sarah knows that earning and maintaining trust involves cultivating humility and demonstrating her commitment to culturally responsive care through her actions, words, and consistent efforts. Sarah's approach involves ongoing self-reflection, a commitment to learning, and a deep appreciation for the diversity within her community. Through these efforts, she fosters sensitivity and humility and contributes to creating a culturally responsive and inclusive health care environment.

Taking Action to Promote Cultural Humility

To create an inclusive, equitable health care environment, nurses should establish goals that encourage cultural humility. It is essential to review and assess these goals frequently, to ensure they align with ongoing growth and development in these areas. Display the goals in a prominent location and replace accomplished goals with new ones. Here are some suggestions for setting these goals:

- Expand cultural awareness: Make it a goal to learn more about different cultures, including their beliefs, values, practices, and health care disparities. This can involve reading books, attending cultural competency workshops or webinars, and conversing with people from different cultural backgrounds.
- Improve cross-cultural communication skills: Set a goal to actively listen, use appropriate language and tone, and be mindful of nonverbal cues. Practice empathetic and nonjudgmental listening to understand clients' unique cultural perspectives better.
- Reflect on biases and assumptions: Regularly reflect on personal biases, assumptions, and stereotypes that may impact one's interactions with clients from different cultures. Seek to challenge and unlearn these biases through self-reflection, self-education, and feedback from colleagues or mentors.
- Seek cultural immersion experiences: Actively engage in cultural immersion experiences to deepen one's understanding of different cultures. This can involve participating in community events, volunteering with diverse populations, or undertaking cultural exchange programs.
- Foster self-awareness: Enhance self-awareness regarding one's cultural identity and how it influences interactions with others. Explore one's cultural background, values, and beliefs to better understand one's cultural perspective and how it may differ from others.
- Build cross-cultural relationships: Seek opportunities to interact and build meaningful relationships with people from different cultural backgrounds within and outside the health care setting.
- Promote cultural competence in practice policies: Advocate for integrating cultural competence into a health care organization's policies and practices. Suggest implementing cultural assessment tools, providing staff cultural competence training, and promoting a diverse and inclusive work environment.
- Engage in ongoing education: Commit to learning and professional development related to cultural competence. Stay informed about emerging research, best practices, and evolving cultural dynamics. Attend conferences, seminars, or online courses to expand knowledge and skills in providing culturally sensitive care.

THEORY IN ACTION

Creating an Action Plan

Now that you have explored the concepts of cultural competence and cultural humility, it is time to develop an action plan.

1. Review findings from the learning activities conducted in the previous sections:
 - Cultural Competence Self-Evaluation Checklist
 - Social Identity Wheel
 - Inventory of Values, Beliefs, and Cultural Heritage
 - How to Deal with Unconscious Bias
 - Implicit Bias
2. Project READY is a program funded by the Institute of Museum and Library Services focused on racial equity and culturally sustaining pedagogy. Use this [template \(<https://openstax.org/r/ready>\)](https://openstax.org/r/ready) from Project READY: Reimagining Equity & Access for Diverse Youth to set three goals for becoming culturally competent and practicing cultural humility: one short-term goal that you can accomplish immediately, one medium-term goal that you can accomplish over the next several months, and one long-term goal that you can accomplish over the next year.

Chapter Summary

25.1 Strategies to Promote Culturally Responsive Nursing

To provide culturally responsive care, nurses must respect clients' values, customs, and beliefs. Cultural responsiveness encompasses cultural awareness, knowledge, skills, encounters, and humility. Cultural humility should be considered in combination with cultural awareness, knowledge, skills, encounters, and desire. Nurses can adopt this approach to develop cultural competence, which ultimately leads to "conscious permeability."

25.2 Root Causes of Stereotypes and Biases

An exploration of factors that inform stereotypes and biases is essential to promoting client-centered care. Nurses can develop a deeper understanding of how their cultural backgrounds and social identities influence their biases and stereotypes by employing effective self-exploration techniques. Learning self-reflection skills, documenting values and beliefs, evaluating the influence on decision making, and pinpointing areas for improvement will help nurses navigate these complexities in client care.

Key Terms

- agent group** those with dominant social status either by birth or acquisition who may knowingly or unknowingly take advantage of their position over the target group
- blind spots** unconscious or implicit biases that individuals are unaware of
- confirmation bias** a tendency to notice and remember information confirming one's existing beliefs; can reinforce and strengthen those beliefs over time
- conscious impermeability** when the nurse recognizes cultural humility's importance but struggles to demonstrate it in practice
- conscious permeability** the mindful act of learning to become culturally humble and use a cultural lens throughout the entire encounter with the client
- counter-stereotypic imaging** the deliberate representation of individuals or groups that challenges or counters traditional stereotypes associated with them
- cultural adaptability** adapting one's behaviors, communication styles, and approaches to fit different cultural environments
- cultural autobiography** a written account of an individual's cultural experiences, upbringing, and identity development

25.3 Managing Conflict

Dealing with conflict in client care, particularly when cultural differences are involved, requires excellent communication skills, empathy, cultural awareness, and a dedication to respectful resolution. Addressing conscious and unconscious biases is crucial when managing conflicts. This can go a long way in reducing biases and stereotypes. Cultural responsiveness can enhance client outcomes, boost client satisfaction rates, and ultimately elevate health care quality.

25.4 Creating an Atmosphere of Trust and Mutual Respect

A variety of factors, such as historical experiences, cultural beliefs, socioeconomic status, language barriers, and access to health care, influence the degree to which particular groups trust the health care system. By approaching client interactions with cultural humility, nurses can work toward creating an inclusive, equitable health care environment that builds client trust and encourages open communication and collaboration.

cultural genogram a genogram depicting family members' cultural identities, traditions, and migration histories

cultural immersion proactively engaging with people from diverse racial, ethnic, gender, and sexual orientation groups

cultural intelligence (CQ) an individual's ability to understand, appreciate, and adapt to different cultural contexts

cultural knowledge understanding different cultural norms, values, beliefs, practices, and historical contexts

cultural sensitivity the awareness, understanding, and consideration of clients and their families' diverse cultural backgrounds, beliefs, practices, and preferences

cultural skills the possession of interpersonal and communication skills to effectively interact and communicate across cultures

cultural understanding the recognition and appreciation of cultural differences and similarities without judgment or bias

decolonization a process of critically examining and deconstructing the Eurocentric and colonial ideologies that have influenced nursing

emotional intelligence (EI) the ability to recognize,

understand, and manage one's emotions and effectively interact with the emotions of others; involves self-awareness, self-regulation, empathy, and social skills	privilege the advantages, entitlements, or prospects bestowed upon individuals based on their social identities, such as race, gender, and economic status, among other factors
empathy the capability to understand and share the feelings and perspectives of others, demonstrating sensitivity and compassion	self-awareness the ability to recognize and understand one's emotions, strengths, weaknesses, and values
evaluative conditioning a psychological concept that explains how repeated pairing with positive or negative stimuli can influence or modify people's attitudes or evaluations toward a particular stimulus	self-management the capacity to manage and regulate one's emotions, impulses, and behaviors in various situations
in-group bias a psychological phenomenon referring to people's tendency to favor members of their own social or cultural in-group	social skills proficiency in building and maintaining positive relationships, effective communication, conflict resolution, and teamwork
individuation the process of seeing individuals as unique and distinct, rather than lumping them into broad categories or stereotypes	stereotype replacement consciously challenging and replacing stereotypical beliefs and assumptions with more accurate and nuanced understandings
mindful awareness being present in the moment and observing thoughts, emotions, and sensations without judgment	systemic oppression the dominant group's ability to impose their version of reality and dictate what is considered normal, true, and right
motivation harnessing emotions to set and achieve goals	target group individuals belonging to social identity groups who experience discrimination, marginalization, oppression, or exploitation at the hands of the agent and the institutionalized system that they represent
perspective taking empathizing with others by putting oneself in their shoes and trying to comprehend their thoughts, emotions, and experiences	unconscious impermeability a lack of recognition that cultural humility is necessary to become culturally competent
power imbalances imbalances in the nurse-client relationship within the health care setting that stem from the differing roles, knowledge, and authority that nurses and clients hold	unconscious permeability spontaneously operating from a place of cultural humility

Review Questions

1. A nurse, concerned that unconscious bias might hinder their cultural humility in providing care to clients with backgrounds different from their own, completes the Social Identity Wheel. Which statement describes the nurse's purpose for using this assessment tool?
 - a. To learn about the client's cultural identity
 - b. To learn to ignore biases and focus on client care
 - c. To assess how the nurse's identity influences client care
 - d. To confirm that the nurse is culturally sensitive
2. What action by a nurse demonstrates cultural humility in client-centered care?
 - a. Using complex medical terminology to show expertise
 - b. Assuming that the nurse's cultural practices are universally applicable
 - c. Adapting care practices to align with the client's cultural preferences
 - d. Disregarding the client's input and family's opinions in decision making
3. Which action by a nurse represents the practice of decolonization?
 - a. Enforcing Eurocentric ideologies to maintain cultural uniformity
 - b. Prioritizing certain cultural perspectives over others
 - c. Recognizing and challenging dominating colonial influences
 - d. Eliminating all traditional healing practices to standardize care
4. A community health nurse critically examines their practice to decrease the influence of privilege when

- providing care to clients in a low-income area. Which statement does the nurse understand to be a critical aspect of privilege in nursing?
- The nursing profession is not influenced by privilege.
 - Privilege is solely determined by socioeconomic status.
 - Acknowledging one's privilege is critical to addressing unjust systems.
 - Privilege has no impact on health disparities or health outcomes.
5. Which action by a nurse demonstrates conscious impermeability in the continuum of developing cultural humility?
- The nurse spontaneously operates from a place of cultural humility.
 - The nurse is aware of social inequities but struggles to demonstrate cultural humility in practice.
 - The nurse performs a mindful act of learning how to become culturally humble.
 - The nurse synergistically combines cultural competence and humility.
6. Which outcome is a potential consequence of power imbalances in nurse-client interactions?
- Increased client autonomy and decision making
 - Enhanced trust and rapport between the nurse and client
 - Unequal treatment and compromised client autonomy
 - Improved communication and understanding between parties
7. According to Campinha-Bacote's "Process of Cultural Competemility in the Delivery of Healthcare Services" model, which question by a nurse represents the "E" in the mnemonic "A-S-K-E-D" for self-examination?
- "Am I aware of my prejudices and biases and the presence of racism and other 'isms'?"
 - "Do I know how to conduct a culturally specific history, physical, mental health, medication, and spiritual assessment in a culturally sensitive manner?"
 - "Do I have knowledge regarding different cultures' worldviews, the field of biocultural ecology, and the importance of addressing social determinants of health?"
 - "Do I have sacred and unremitting encounters with people from cultures different from mine, and am I committed to resolving cross-cultural conflicts?"
8. Which action can a nurse take to cultivate mindful awareness in interactions with clients?
- Practicing active listening and seeking to understand the speaker's perspective without interruptions
 - Making quick judgments and forming opinions based on automatic biases and assumptions
 - Avoiding reflection and self-awareness to maintain a detached approach in client care
 - Embracing a fixed mindset and resisting new information or diverse experiences
9. Which action is the nurse performing when they show a preference for members of their social identity group, leading to a more positive evaluation of individuals within their own group?
- Out-Group Homogeneity
 - Confirmation Bias
 - In-Group Favoritism
 - Limited Interactions
10. What action can a nurse take to reduce biases in nurse-client interactions?
- Providing care based on past encounters with individuals of the same background
 - Explaining the nurse's values and beliefs to the client
 - Reflecting on how their background influences their perception of others
 - Limiting interactions with individuals from certain social identity groups

CHAPTER 26

Health Promotion and Maintenance Across the Lifespan

FIGURE 26.1 Because they care for clients of all ages, nurses must be aware of how health needs change throughout the lifespan. (credit: modification of work “Harrison Ranch in Okfuskee County, Oklahoma” by Preston Keres/USDA/Flickr, Public Domain)

CHAPTER OUTLINE

- 26.1 Maternal Health
 - 26.2 Newborn, Infant, and Toddler Health
 - 26.3 Preschool, School-Age, and Adolescent Health
 - 26.4 Adult Health
 - 26.5 Older Adult Health
-

INTRODUCTION As a nurse at the City Clinic, Kai sees many clients of different ages. Today, an extended family arrives seeking care. The family consists of Charles, his partner Cody, and their children: 18-year-old Louisa, who is pregnant with her first child; 10-year-old Devon; and 4-year-old Kris. Charles’s mother Pearl also lives with the family and accompanies them to the clinic. Throughout the visit with the family and each member individually, Kai has many opportunities to provide health promotion and maintenance education. This requires Kai to be knowledgeable about the health promotion needs of childbearing, older adult, adult, adolescent, school-age, and preschool clients.

As mentioned in [Health Promotion and Disease Prevention Strategies](#), health promotion is the process of empowering people to increase control over, and to improve, their health. Disease prevention involves specific, population- and individual-based interventions geared toward decreasing the burden of communicable and noncommunicable diseases and their associated risk factors. As clients grow and age, their health needs change. Nurses like Kai, who provide care to various clients, must understand the basics of health promotion and

maintenance concerning clients throughout their lifespan. Nurses present individuals, families, and communities with disease-prevention and injury-prevention services, including immunizations, screenings, health education, and counseling. This means knowing current standards, outcomes, disease prevention strategies, and risk factors. To implement prevention strategies effectively, nurses must develop activities targeted to all age groups throughout the lifespan. Doing so provides clients with anticipatory guidance as they move through their lifespan.

26.1 Maternal Health

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 26.1.1 Assess the global and national health status of childbearing clients.
- 26.1.2 Examine major risk factors influencing the health of childbearing clients.
- 26.1.3 Create evidence-based educational interventions to promote self-care for health promotion, illness prevention, and illness management of childbearing clients.
- 26.1.4 Identify Healthy People 2030 goals established for childbearing clients.
- 26.1.5 Describe health promotion and disease prevention actions applicable to maternal health.
- 26.1.6 Discuss evidence-based strategies for integrating sociocultural and linguistically responsive health promotion and disease prevention interventions in maternal health clinical practice.

Maternal health begins at preconception and continues throughout the pregnancy. Childbearing is a critical period that requires special attention, as it impacts the health of the pregnant person and the child. This section describes the current health status of childbearing clients in the United States and globally, identifies risk factors that influence their health, and describes educational interventions and Healthy People 2030 goals specific to this population. It also reviews health promotion and disease prevention actions applicable to maternal health and health literacy efforts related to this population.

National and Global Health Status of Childbearing Clients

The **infant mortality rate** is an important measure of the well-being of infants, children, and pregnant clients. This is the number of children dying under 1 year of age divided by the number of live births that year. The infant mortality rate is associated with factors such as maternal health, quality of and access to medical care, socioeconomic conditions, and public health practices.

In the United States, the 2020 infant mortality rate was 5.4 deaths per 1,000 live births (Centers for Disease Control and Prevention [CDC], 2022g). The top five causes of infant death in 2020 were congenital anomaly, preterm birth and **low birth weight** (LBW), **sudden infant death syndrome** (SIDS), injuries such as suffocation, and maternal pregnancy complications. Many of these deaths may have been prevented by improving the childbearing client's health. According to the CDC (2022g), about 1 in every 33 babies has a congenital disorder. Some examples include cleft lip or palate, heart defects, and hearing loss. Managing health conditions and adopting healthy behaviors before pregnancy can increase the chances of a healthy baby. **Preterm birth** occurs when a baby is born before 37 weeks of pregnancy. In 2021, preterm birth affected about 1 of every 10 infants born in the United States, increasing from 10.1 percent in 2020 to 10.5 percent in 2021. In Black women, the rate of preterm births is about 50 percent higher than that among White or Hispanic women (CDC, 2022q).

The CDC (2023g) also monitors trends in pregnancy-related mortality ratios in the United States through the [Pregnancy Mortality Surveillance System \(<https://openstax.org/r/cdcreproductivehealth>\)](https://openstax.org/r/cdcreproductivehealth). Since 1987, the number of reported pregnancy-related deaths has increased from 7.2 deaths per 100,000 live births to 17.6 deaths per 100,000 live births in 2019 (CDC, 2023g). The most common causes of these deaths from 2017 to 2019 included infections, cardiomyopathy, hemorrhage, and other cardiovascular and non-cardiovascular medical conditions (CDC, 2023g). Non-Hispanic Native Hawaiian or other Pacific Islanders, non-Hispanic Blacks, and non-Hispanic American Indian or Alaska Native (AIAN) clients had two or more times more pregnancy-related deaths than non-Hispanic White, non-Hispanic Asian, or Hispanic clients (CDC, 2023g).

Globally, the infant mortality rate in 2021 was 28 deaths per 1,000 live births (CDC, 2023g). An estimated 287,000 maternal deaths occurred in 2020, with an overall global maternal mortality rate of 223 maternal deaths per 100,000 live births (WHO, 2023c). This equates to about 800 maternal deaths daily and one every two minutes globally. The WHO (2023c) indicates that “almost all of these deaths occurred in low-resource settings, and most

could have been prevented” (para. 1). The WHO (2022a) emphasized that maternal mortality is a health indicator that “shows very wide gaps between rich and poor and between countries” (para. 1). This has led to the World Health Organization et al. (2023) developing a Sustainable Development Goal, Target 3.1: Reduce the global maternal mortality ratio to less than 70 per 100,000 live births with a target date of 2030.

THE ROOTS OF HEALTH INEQUITIES

Maternal Mortality in the United States

The U.S. Department of Health and Human Services Office of Disease Prevention and Health Promotion (ODPHP, n.d.-g) indicated that in 2016, women in the United States were more likely to die from childbirth than those in other developed countries. Subsequently, a study by Tikkannen et al. (2020) found that the United States has the highest maternal mortality rate among developed countries despite the fact that most maternal deaths are preventable. The study also found that about one-third of the pregnancy-related deaths happen after the client has given birth, which is considered the period up to a year post-birth.

(See Tikkannen et al., 2020.)

Risk Factors Influencing the Health of Childbearing Clients

Existing health conditions, age, and the client’s lifestyle can make a pregnancy high risk. Some risk factors related to health issues can occur before and during pregnancy, which the Eunice Kennedy Shriver National Institute of Child Health and Human Development (2018) refers to as “conditions of pregnancy” (para. 7).

Existing Health Conditions

[Table 26.1](#) presents some of the most common existing health conditions that can lead to a high-risk pregnancy. Because each pregnancy is individual, an existing condition may not lead to a risky pregnancy. It is necessary for the nurse, however, to be aware of risk factors.

Existing Condition	Management	Complications
Hypertension	<ul style="list-style-type: none"> • Before pregnancy, client should schedule a preconception appointment with their provider. • Recommend losing weight before pregnancy if overweight. • Monitor client frequently during pregnancy. • Client should keep prenatal appointments. • Client should take medications as prescribed. • Client should stay active. • Client may receive daily low-dose (81 mg) aspirin starting late in the first trimester. 	<ul style="list-style-type: none"> • Uncontrolled hypertension damages the client's kidneys. • Uncontrolled hypertension increases the risk for a low birth weight (LBW) newborn. • Preeclampsia (a sudden spike in the client's high blood pressure) reduces the blood supply to the fetus, providing less oxygen and fewer nutrients. • Eclampsia (when clients with preeclampsia develop seizures or coma) may occur.
Polycystic ovary syndrome (PCOS)	<ul style="list-style-type: none"> • Symptoms include absence of ovulation, high androgen levels, ovarian growths, acne, insulin resistance, and obstructive sleep apnea, which may prevent pregnancy. • Clients with PCOS should exercise regularly and monitor weight and blood sugar levels. 	<ul style="list-style-type: none"> • Clients with PCOS have higher rates of losing a pregnancy before 20 weeks, developing diabetes or preeclampsia, and requiring cesarean section.
Diabetes	<ul style="list-style-type: none"> • Childbearing clients living with diabetes must manage their blood sugar levels before and throughout pregnancy. • Metabolism changes during pregnancy may require special treatment even if diabetes is well-controlled (National Institute of Diabetes and Digestive and Kidney Diseases, 2017). 	<ul style="list-style-type: none"> • High blood sugar levels in the pregnant client can lead to congenital disorders. • Babies born to clients with diabetes may have low blood sugar upon birth and may be large for gestational age.
Kidney disease	<ul style="list-style-type: none"> • Specific diet changes, medication, and follow-up appointments are often necessary to promote a healthy birth (National Institute of Diabetes and Digestive and Kidney Diseases, 2017). 	<ul style="list-style-type: none"> • May lead to difficulty getting pregnant or maintaining a pregnancy • May lead to preterm delivery, LBW, and preeclampsia

TABLE 26.1 Existing Health Conditions That Can Lead to a High-Risk Pregnancy

Existing Condition	Management	Complications
Autoimmune disease, such as lupus, multiple sclerosis (MS), and myasthenia gravis (MG)	<ul style="list-style-type: none"> Some medications used in their treatment may harm the fetus, requiring the client to work closely with the health care team throughout the pregnancy (Office on Women's Health, 2021a). 	<ul style="list-style-type: none"> Clients with lupus and MS may have difficulties during pregnancy and birth. Clients with lupus may have preterm birth or stillbirth. Clients with MG may have difficulty breathing during pregnancy.
Thyroid disease (hypothyroidism or hyperthyroidism)	<ul style="list-style-type: none"> Clients with hypothyroidism planning to become pregnant should optimize their thyroid hormone dose preconception, and early dose adjustments may be necessary (Ross, 2023). Childbearing clients with Graves' disease who take levothyroxine before pregnancy should have their thyroid receptor binding antibody (TRAB) level checked early in pregnancy and at 18–22 weeks gestation if it was found to be elevated initially. Clients with positive antibodies require close observation during and after pregnancy, with serial fetal ultrasounds and postnatal thyroid function tests (Sharma, 2020). The goal of treatment for childbearing clients with hyperthyroidism should be to maintain persistent, but mild, hyperthyroidism in the mother (Ross, 2022). 	<ul style="list-style-type: none"> Uncontrolled thyroid disease can lead to problems with the fetus, such as heart failure, poor weight gain, and brain development problems. There is increased risk of placental transfer and resulting fetal/neonatal hyperthyroidism related to positive TRAB levels. The goal is to prevent fetal hypothyroidism, as the fetal thyroid is more sensitive to the action of antithyroid drugs.
Obesity (adult body mass index [BMI] of 30 or higher)	<ul style="list-style-type: none"> Clients who are obese should only gain between 11 and 20 pounds total during pregnancy (Ramsey & Schenken, 2022). 	<ul style="list-style-type: none"> Associated with risk of developing diabetes during pregnancy, a larger fetus that makes the birth process more difficult, disordered sleep breathing and sleep apnea, an increased risk of fetal structural heart problems, and increased weight gain that can lead to other poor pregnancy outcomes

TABLE 26.1 Existing Health Conditions That Can Lead to a High-Risk Pregnancy

Existing Condition	Management	Complications
Human immunodeficiency virus (HIV), acquired immunodeficiency syndrome (AIDS)	<ul style="list-style-type: none"> Effective treatments have been discovered to reduce and prevent the spread of HIV from mother to fetus or infant (Hughes & Cu-Uvin, 2023). Surgical delivery prior to “water breaking” and feeding formula rather than breastfeeding can also prevent HIV transmission (Hughes & Cu-Uvin, 2023). 	<ul style="list-style-type: none"> HIV can pass to a fetus during pregnancy, labor and delivery, and breastfeeding.
Sexually transmitted infections (STIs)	<ul style="list-style-type: none"> Other STIs can be transmitted intrauterine or during the perinatal period to the fetus or baby. Clients should be screened at the initial prenatal visit for hepatitis B, syphilis, chlamydia, and gonorrhea. Additional follow-up and repeat screening will occur later during gestation (Ghanem & Tuddenham, 2022). 	<ul style="list-style-type: none"> STIs in the childbearing client can lead to premature labor, infection in the uterus after birth, LBW, eye infections, pneumonia, sepsis, brain damage, lack of coordination in body movements, blindness, deafness, acute hepatitis, meningitis, chronic liver disease, and stillbirth. Some STIs can pass to the baby during breastfeeding (Office on Women’s Health, 2021b).
Zika infection	<ul style="list-style-type: none"> Symptomatic pregnant clients with recent travel to areas with a risk of Zika infection should be tested (CDC, 2022x). Pregnant clients infected with Zika should receive an ultrasound between 18 and 20 weeks of pregnancy and again in the second and third trimesters, as indicated (CDC, 2021o). Further testing of amniotic, placental, and fetal tissues may be performed (CDC, 2022x). 	<ul style="list-style-type: none"> The fetus of childbearing clients who are infected with Zika just before or during pregnancy is at higher risk for brain and nervous system problems, including microcephaly (a condition where the head is smaller than normal) (Oduyebo et al., 2017). Zika can also increase the risk for pregnancy loss and stillbirth.

TABLE 26.1 Existing Health Conditions That Can Lead to a High-Risk Pregnancy

Age

The U.S. birth rate per 1,000 females ages 15 to 19 decreased steadily from its peak of 61.8 births in 1991 to 15.4 in 2020 (Osterman et al., 2022). The birth rate for women ages 40 to 44 was 11.8, for women ages 45 to 49 was 0.9, and for women ages 50 and over was 1.0 (Osterman et al., 2022). Age at pregnancy can correlate with pregnancy risks and childbirth and fetal issues.

Pregnant adolescents are more likely to develop pregnancy-related high blood pressure and anemia and to have preterm labor and delivery. Adolescents may have unknown STIs, and they are less likely to seek prenatal care, which can lead to other risk factors. For example, a pregnant adolescent may not know to take certain medications or may not realize the importance of good nutrition (Chacko, 2023).

First-time pregnancies after age 35 are considered “older first-time mothers” and consist of nine percent of births in the United States (Fretts, 2022). These childbearing clients are at higher risk for spontaneous abortion or pregnancy loss, ectopic pregnancy, chromosomal abnormalities (particularly cardiac anomalies), placental problems, LBW newborns, and preterm delivery. Fretts (2022) also indicated that childbearing clients “40 years or older are at a sixfold increased risk of maternal death when compared with women less than 20 years of age” (para. 48); Black childbearing clients aged 40 or older are over three times more likely to die during pregnancy than White childbearing clients in this age group.

Lifestyle Factors

Drinking alcohol during pregnancy can increase the baby’s risk for problems such as **fetal alcohol spectrum disorders** (FASDs) and SIDS. FASDs are completely preventable; if a client does not drink alcohol during pregnancy, their child will not have an FASD (CDC, 2022s). Alcohol use can also lead to miscarriage or stillbirth. There is no safe amount of alcohol to drink during pregnancy (CDC, 2022s). Different FASD diagnoses are based on particular symptoms, as shown in [Table 26.2](#).

Diagnosis	Symptoms
Fetal alcohol syndrome (FAS)	Central nervous system (CNS) problems, minor facial features, growth problems; problems with learning, memory, attention span, communication, vision, and/or hearing. May have difficulties in school and trouble getting along with others.
Alcohol-related neurodevelopmental disorder (ARND)	Intellectual disabilities; problems with behavior and learning. May have difficulties in school, particularly with math, memory, attention, judgment, and poor impulse control.
Alcohol-related birth defects (ARBD)	May have problems with the heart, kidneys, bones, and/or hearing.
Neurobehavioral disorder associated with prenatal alcohol exposure (ND-PAE)	The delivering client must have consumed more than 13 alcoholic drinks per month of pregnancy (that is, any 30-day period of pregnancy) or more than two alcoholic drinks in one setting. For diagnosis with ND-PAE, the child must have problems in: <ol style="list-style-type: none"> Thinking and memory, where the child may have trouble planning or may forget material they have already learned Behavior problems, such as severe tantrums, mood issues, and difficulty shifting attention from one task to another Trouble with day-to-day living, which can include problems with bathing, dressing for the weather, and playing with other children

TABLE 26.2 FASD Diagnoses

Smoking can have adverse health effects before, during, and after pregnancy. The CDC (2020a) indicates that childbearing clients who smoke tobacco have more difficulty becoming pregnant. Smoking tobacco during pregnancy can lead to preterm birth, LBW, miscarriage, congenital disorders, and SIDS. Pregnant clients exposed to secondhand smoke are more likely to have LBW babies. Babies exposed to secondhand tobacco smoke are more likely to die from SIDS and have weaker lungs, which can lead to additional health problems (CDC, 2020a). Childbearing clients who smoke marijuana may double their risk of stillbirth; using marijuana during pregnancy can interfere with fetal brain development (Chang, 2023).

Childbearing clients who use other drugs during pregnancy can experience problems with fetal and infant health. Use of opioids such as heroin, diverted or misused prescription opioids, or other morphine-like drugs is associated with substantial maternal, fetal, and neonatal risks (Seligman et al., 2023). Cocaine use by the pregnant client also leads to preterm birth and LBW. Methamphetamine exposure during pregnancy has been associated with maternal and neonatal morbidity and mortality (Chang, 2023). Self-reported data from 2019 indicated that 6.6 percent of pregnant clients reported prescription opioid use during pregnancy, and 21.2 percent of these reported drug misuse

(Ko et al., 2020). The drug overdose mortality rate per 100,000 for pregnant or postpartum persons almost doubled from 2017 (6.56) to 2020 (11.85) in the United States (Bruzelius & Martins, 2022).

Neonatal abstinence syndrome (NAS) is a treatable condition in newborns exposed to certain drugs, particularly opioids, while in utero. The term **neonatal opioid withdrawal syndrome** (NOWS) specifically describes the symptoms experienced by infants exposed to opioids. Both NAS and NOWS include intense irritability, difficulty with feeding, respiratory issues, and seizures. To mitigate or prevent negative outcomes associated with NAS and NOWS, nurses and health care providers must engage the pregnant client with opioid and substance use disorders in substance use treatment and other supportive services as part of prenatal care (National Center on Substance Abuse and Child Welfare, n.d.).

Challenges and Complications of Childbearing

[Table 26.3](#) lists other challenges and risks that can arise during pregnancy, childbirth, and the postpartum period for the childbearing client. Understanding the challenges and complications of childbearing is crucial for health care professionals. The goal is to support informed decision-making, promote proactive prenatal care, and ultimately contribute to the well-being of childbearing clients and their babies. Due to the risks and concerns with a rising rate of cesarean section deliveries, the WHO (2018) and ACOG et al. (2014) have suggested interventions to reduce the rate of unnecessary cesarean deliveries.

Challenge	Risk Factors	Complications
Multiple gestation	<ul style="list-style-type: none"> • Giving birth after age 30 • Use of fertility drugs 	<ul style="list-style-type: none"> • Increases the risk of premature birth • Will likely require cesarean section delivery • Newborn likely to be smaller • If born prematurely, likely to have difficulty breathing (Chasen, 2022)
Preeclampsia	<ul style="list-style-type: none"> • Preeclampsia in a previous pregnancy • Multiple gestation • Preexisting diabetes, hypertension, kidney disease, or an autoimmune disease • First pregnancy • Has not delivered a baby in 10 years or more • Obesity • Family history of preeclampsia • Complications in a previous pregnancy • Use of in vitro fertilization (IVF) • Age 35 or older (March of Dimes, 2023) 	<ul style="list-style-type: none"> • Childbearing client's kidneys and liver may work abnormally • Often leads to preterm birth • Difficulties with blood clotting • Progression to eclampsia • Stroke • Preterm birth to prevent serious problems for the childbearing client and the infant • Placental abruption leading to a lack of oxygen and nutrition for the infant • Intrauterine growth restriction (IUGR) in the infant due to narrowing of blood vessels in the uterus and placenta • Can increase childbearing client's risk for heart disease, diabetes, and kidney disease later in life • Can lead to post-partum preeclampsia (within 48 hours to up to 6 weeks after birth), which can lead to HELLP syndrome, seizures, pulmonary edema, thromboembolism, stroke, and death (March of Dimes, 2023)

TABLE 26.3 Pregnancy, Childbirth, and the Postpartum Challenges and Risks

Challenge	Risk Factors	Complications
Gestational diabetes	<ul style="list-style-type: none"> Normal hormonal changes and weight gain during pregnancy may lead to insulin resistance, increasing the body's need for insulin Insulin resistance prior to pregnancy Having gestational diabetes during a previous pregnancy Giving birth previously to a baby who weighed over 9 pounds Overweight or obese Age over 25 Family history of type 2 diabetes PCOS Black or African American, Hispanic, Latino, AIAN, Native Hawaii, or Pacific Island ethnicity (CDC, 2022v, para. 4) 	<ul style="list-style-type: none"> Increases risk of hypertension during pregnancy Increases risk of having low blood sugar and developing type 2 diabetes later in life Places the baby at risk of premature birth and being large for gestational age (9 pounds or larger) (CDC, 2022v)
Preterm birth	<ul style="list-style-type: none"> Previous preterm birth (ACOG, 2022) Becoming pregnant within 12 months of previous delivery (Shachar & Lyell, 2023) 	<ul style="list-style-type: none"> Short-term complications include hypothermia, respiratory abnormalities, cardiovascular abnormalities such as patent ductus arteriosus or low blood pressure, intraventricular hemorrhage, glucose abnormalities, necrotizing enterocolitis, infection, and retinopathy of prematurity (Mandy, 2021). Long-term complications include need for hospitalizations, neurodevelopmental impairments, vision problems, growth impairments, lung disease, and other chronic health issues (Mandy, 2023).

TABLE 26.3 Pregnancy, Childbirth, and the Postpartum Challenges and Risks

Challenge	Risk Factors	Complications
Delivery via cesarean section	<ul style="list-style-type: none"> • Complications during pregnancy or complications that affect the baby, labor, and birth 	<ul style="list-style-type: none"> • Risk of surgical site infection • Blood loss that may require transfusion • Injury to organs near the uterus, such as the bladder or intestines • Development of thromboembolism • Development of an amniotic fluid embolism • Difficulty breastfeeding after delivery • More likely in future pregnancies to require a cesarean section • Baby having difficulty breathing • Baby being affected by anesthesia administered during the cesarean section, leading to inactivity or sluggishness • Injury to the baby during surgery (Berghella, 2023, WHO, 2018)
Maternal infections	<ul style="list-style-type: none"> • Entering pregnancy carrying an infection such as genital herpes or another STI • Pregnancy diverts a large portion of the childbearing client's immune system toward supporting the developing baby 	<ul style="list-style-type: none"> • Urinary tract infection can impact the client's kidneys or lead to a high fever, which could harm the client and baby. • Uterine infections can cause premature labor. • Fifth disease increases the chances of miscarriage. • Many STIs can cause early labor and contraindicate vaginal delivery (i.e., gonorrhea can lead to blindness in a vaginally delivered baby). • TORCH (toxoplasmosis, others [syphilis, Zika virus, varicella-zoster virus], rubella, cytomegalovirus, and herpes simplex virus) can cause fetal and neonatal mortality and abnormal growth, developmental anomalies, and other early and later childhood morbidities (Johnson, 2023).

TABLE 26.3 Pregnancy, Childbirth, and the Postpartum Challenges and Risks

Challenge	Risk Factors	Complications
Postpartum hemorrhage	<ul style="list-style-type: none"> • Previous postpartum hemorrhage • Previous cesarean or other uterine surgery • History of postpartum hemorrhage in the maternal line • Obesity • High parity • Conception by assisted reproductive technology • Anemia • Multiple gestation • Pregnancy with a large-for-gestational-age baby • Post-term pregnancy • Hypertension during pregnancy • Precipitous labor 	<ul style="list-style-type: none"> • Short-term complications: anemia, need for hysterectomy, organ failure related to hemodynamic instability, thromboembolism, and abdominal compartment syndrome • Long-term complications: Sheehan syndrome (postpartum hypopituitarism) and Asherman syndrome (intrauterine adhesions that can lead to menstrual abnormalities and infertility) • Maternal death (Belfort, 2023)
Postpartum depression	<ul style="list-style-type: none"> • Depression during pregnancy • History of depression • Stressful life events • Poor social and financial support in the first six weeks after childbirth • Perinatal anxiety symptoms and disorders • Age less than 25 years • Single marital status • Multiparity 	<ul style="list-style-type: none"> • Impaired bonding with baby • Poor health care of the baby • Abnormal infant and child development • Cognitive impairment and psychopathology in the child • Marital discord • Suicide • Infanticide (Viguera, 2023)

TABLE 26.3 Pregnancy, Childbirth, and the Postpartum Challenges and Risks

In some cases, fetal anomalies or genetic conditions may be detected and treated in utero or immediately following birth. For example, spina bifida may be repaired before birth (Bowman, 2022). Certain heart problems common among infants with Down syndrome will require immediate surgical correction following birth (Altman, 2022).

Educational Interventions to Promote Self-Care in Childbearing Clients

Self-care for the childbearing client begins preconception and involves many of the same health promotion activities clients should engage in throughout their lifespan, including during adolescence. Education regarding risk assessment and screening, health promotion and counseling, and any appropriate topic based on identified risk factors will promote optimal health promotion and self-care during pregnancy. Once a pregnancy is identified, education moves toward anticipatory guidance, or what the childbearing client may expect to occur during pregnancy. This may include the normal discomforts during pregnancy, body changes, weight gain expectations, signs and symptoms of problems and when/how to report them, available community resources, nutritional needs,

newborn care, and other topics (Lockwood & Magriples, 2023).

Healthy People 2030 Goals for Childbearing Clients

The overarching goal of Healthy People 2030 related to pregnancy and childbirth is to “prevent pregnancy complications and maternal deaths and improve women’s health before, during, and after pregnancy” (ODPHP, n.d.-g, para. 1). Healthy People 2023 includes several pregnancy and childbirth objectives related to this goal.

HEALTHY PEOPLE 2030

Pregnancy and Childbirth

Healthy People 2030 [Pregnancy and Childbirth Objectives](https://openstax.org/r/healthhealth) (<https://openstax.org/r/healthhealth>) focus on the broad goals of preventing pregnancy complications and maternal deaths while also helping women stay healthy before, during, and after pregnancy. They specifically address prenatal care; drug, alcohol, and tobacco abstinence during pregnancy; family planning; reduction of sexually transmitted infections; and vaccination of pregnant clients.

Health Promotion and Disease Prevention Activities to Improve the Health of Childbearing Clients

Health promotion activities can help prevent complications during pregnancy and childbirth, promote healthy behaviors throughout the lifespan, and improve the client’s and child’s overall health outcomes. The goal is to empower this population to take an active role in their health and well-being while promoting positive health outcomes for the pregnant person and child. A range of health promotion activities is available, including:

- Promoting healthy lifestyles (e.g., healthy diet, exercise, abstaining from alcohol and tobacco)
- Encouraging regular prenatal care
- Providing education on childbirth and parenting
- Supporting breastfeeding
- Providing education to decrease postpartum depression

Health promotion activities can also address social determinants of health (SDOH), such as access to health care, housing, and nutrition, ensuring these clients have the resources necessary to maintain good health. Collaboration among health care providers, community organizations, and other partners will provide childbearing clients with the support and resources they need for a healthy and successful pregnancy and birth.

Childbearing clients can take prevention efforts before and during pregnancy. The Client Teaching feature below lists some of the most important preventive measures for childbearing clients.

CLIENT TEACHING GUIDELINES

Preventive Measures for Childbearing Clients

The community health nurse may teach childbearing clients the following:

- Get regular medical checkups.
- Eat healthy foods and maintain a healthy weight.
- Make sure any medical conditions are under control.
- Take a vitamin with folic acid every day.
- Do not smoke, drink alcohol, or use drugs.
- Talk with your doctor about any medications you are taking or thinking about taking, including prescription and over-the-counter medications and dietary and herbal products.
- Avoid exposure to toxic secondhand smoke, chemicals, and fumes.
- Get tested for infectious diseases and get these recommended vaccinations (Lockwood & Magriples, 2023):
 - COVID-19

- Influenza, if pregnant during flu season, regardless of stage of pregnancy
- Tetanus and diphtheria (Tdap) immunizations and boosters should be up-to-date; receive Tdap in the third trimester of each pregnancy to protect the infant from pertussis regardless of prior maternal vaccination (Yawetz, 2023)
- Wash your hands often, especially after contact with diapers or secretions associated with a child who is in daycare.
- Avoid kissing children under age 6 on the mouth or cheek and sharing food or drinks with young children; clean all surfaces and toys that may come into contact with children's secretions.
- Avoid contact with those who have fevers that could be infectious.
- Avoid changing or cleaning cat litter boxes.
- Avoid x-rays and other radiation.
- Use condoms during sex to prevent exposure to STDs.
- Avoid ingesting contaminated, undercooked, or cured meat or meat products; soil-contaminated fruits or vegetables; and contaminated unfiltered water.
- Wash utensils and surfaces that are used to prepare raw fish with hot, soapy water.
- If not immune to varicella infection, Varizig (VZIG) is recommended during pregnancy to prevent maternal complications.
- Avoid Zika virus by postponing travel to areas with ongoing mosquito transmission of the virus.

(See Office of the Surgeon General, 2020.)

Even if a childbearing client takes prevention measures, there is still a risk of having a child with a congenital disorder. Following healthy habits early and consistently throughout the pregnancy gives the best chance of having a healthy baby (New York State Department of Health, 2017).

Primary Prevention

Primary prevention for childbearing clients refers to activities aimed at preventing health problems before they occur. Some examples of primary prevention strategies to improve the health of childbearing clients include:

- Healthy lifestyle promotion
- Immunizations
- Preconception care
- Education on safe sex and family planning
- Screening for infectious diseases

Secondary Prevention

Secondary prevention for childbearing clients refers to activities aimed at detecting and treating health problems at an early stage, before they are even problematic, to prevent subclinical disease progression. Some examples of secondary prevention strategies to improve the health of childbearing clients include:

- Prenatal care
- Screening for genetic disorders
- Screening for gestational diabetes
- Early detection and treatment of infections
- Screening for postpartum depression

Tertiary Prevention

Tertiary prevention for childbearing clients refers to activities aimed at managing and treating health problems that have already occurred and preventing their recurrence or further complications. Some examples of tertiary prevention strategies to improve the health of childbearing clients include:

- Management of chronic health conditions, such as diabetes, hypertension, and asthma
- Treatment of postpartum complications, such as postpartum hemorrhage, infection, and thromboembolism
- Support for breastfeeding
- Mental health treatment

- Family planning to prevent unintended pregnancy in the postpartum period

Table 26.4 summarizes these three levels of prevention and includes primordial and quaternary prevention as well.

Levels of Prevention	Specific Example of Level of Prevention
Primordial	A state's governmental policy increases taxes on cigarettes to discourage smoking.
Primary	Local advertisements are provided via different forms of media depicting the dangers of smoking to childbearing clients and their babies.
Secondary	A local women's health center offers free tobacco cessation programs to childbearing clients.
Tertiary	The nurse provides care to a LBW newborn whose mother smoked during pregnancy and educates the mother to prevent further complications.
Quaternary	Over-screening for gestational diabetes during the first half of pregnancy is prevented by targeting early pregnancy screening to those at increased risk of undiagnosed type 2 diabetes.

TABLE 26.4 Five Levels of Prevention for the Childbearing Client

Integration of Sociocultural and Linguistically Responsive Interventions in Maternal Health

Providing high-quality maternal health care requires the nurse to integrate sociocultural and linguistically responsive interventions. Pregnancy and childbirth are influenced by a complex set of social, cultural, and linguistic factors that can affect health outcomes for the client and the baby. Nurses must consider their clients' sociocultural and linguistic backgrounds and provide care sensitive to their needs and preferences. This section explores the reasons for integrating sociocultural and linguistically responsive interventions in maternal health care and provides examples of interventions that can improve health outcomes for childbearing clients.

Sociocultural Interventions

Addressing the sociocultural preferences of maternal clients is necessary to provide client-centered care. The WHO (2017) [Standards for Improving Quality of Maternal and Newborn Care in Health Facilities \(<https://openstax.org/r/cdn>\)](https://openstax.org/r/cdn) recommend that health care professionals participate in regular education to improve their interpersonal communication, counseling skills, and cultural competence to encourage respectful maternity care. The Joint Commission, the National Institutes of Health, the International Confederation of Midwives, and the International Federation of Gynecology and Obstetrics have issued similar initiatives (Hodin, 2018).

Interventions to provide culturally appropriate maternal health services, specifically related to clients' ethnicity, language, and religion, have positively affected pregnant people's continual use of maternity care, particularly prenatal care (Jones et al., 2017). In a review of 15 studies to examine how such interventions affected the use of pregnancy care, 10 studies found this to be true, and four themes evolved to describe the barriers and facilitators to ensuring socioculturally appropriate maternity care. These included (Jones et al., 2017, pp. 5–7):

- Access—Interventions should consider broader economic, geographic, and social factors that affect ethnic minority groups' access to service.
- Community participation—Interventions should include community participation to understand problems with existing services and potential solutions from a community perspective as well as in developing and implementing interventions.
- Person-centered care—Respectful, person-centered care should be at the core of all interventions.
- Continuum of care—Interventions should be spread all along the continuum of care. For example, rather than focusing interventions on prenatal care, effective partnerships should extend interventions between the socioculturally appropriate service and all other health care professionals clients and their families encounter along the continuum of care from detection of pregnancy until after birth.

Several sociocultural interventions can be integrated into maternal health to positively impact maternal health outcomes. Providing cultural competency training for all health care workers will help them better understand the cultural beliefs, practices, and values of the populations they serve and promote the provision of care that is sensitive to that population's needs and preferences. Community-based interventions, such as peer groups and community health workers, can help connect maternal clients with culturally appropriate resources and support. Addressing stigma and discrimination related to pregnancy and childbirth, such as discrimination against teen or

single parents or those with HIV, can help promote equitable and respectful care for all clients. By providing each of these interventions, the nurse can work to improve the health outcomes for childbearing clients and their children.

CONVERSATIONS ABOUT CULTURE

Addressing Racial and Ethnic Disparities in Maternal and Child Health Through Home Visiting Programs

[Access multimedia content \(<https://openstax.org/books/population-health/pages/26-1-maternal-health>\)](https://openstax.org/books/population-health/pages/26-1-maternal-health)

[Aligning Early Childhood and Medicaid \(<https://openstax.org/r/chcs>\)](https://openstax.org/r/chcs) is a national initiative funded by the Robert Wood Johnson Foundation that works to better align Medicaid and state agencies responsible for early childhood programs. Its goal is to improve the health and social outcomes of low-income infants, young children, and families. The initiative included eight states: Colorado, Minnesota, New Jersey, New York, Oregon, Rhode Island, Vermont, and Washington. A specific intervention taken within this initiative involved addressing racial and ethnic disparities in maternal and child health through home visiting programs.

Watch the video, and then respond to the following questions.

1. Describe three sociocultural nursing interventions described in the video that could be used to positively impact the health of maternal clients in any sociocultural population.
2. Now, connect these three nursing interventions to one of the five social determinants of health (SDOH).

Linguistically Responsive Interventions

A variety of interventions are available to provide linguistically responsive care, some of which are included in [Culturally and Linguistically Responsive Nursing Care](#). Nurses can use the services of professional medical interpreters to ensure that the client can communicate with others effectively. Communication is essential when educating the client about prenatal care, labor and delivery, and postpartum care. Nurses should provide educational materials written in the client's preferred language that consider the client's sociocultural beliefs and practices. They can provide visual aids to explain more complex concepts to clients with limited English proficiency and use plain language to ensure clients understand the information being provided. Nurses should encourage clients to ask questions and clarify doubts regarding the pregnancy or other issues.

Nurses should also assess their clients' health literacy levels and communicate accordingly to allow clients to best understand their health conditions and improve their health outcomes. Health literacy skills such as "reading, listening, analyzing, decision-making, and using these skills in health situations" (Solhi et al., 2019, p. 3), regardless of the client's educational level or general reading ability, will have a definite impact on the health outcomes of a client and their child. The maternal client must be involved in health promotion and preventive care, but if they do not understand health concepts, they will have difficulty making informed decisions (Solhi et al., 2019). Even for those with health literacy skills, the first pregnancy may be full of surprises if their education is not specifically in this realm. Also, the maternal client's understanding of health information directly impacts their child's health. Solhi et al. (2019) determined that adopting interventions to increase health literacy in maternal clients, such as those previously described, promoted physical and mental self-care during pregnancy, particularly over time.

26.2 Newborn, Infant, and Toddler Health

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 26.2.1 Assess the global and national health status of the newborn, infant, and toddler.
- 26.2.2 Examine major risk factors influencing the health of the newborn, infant, and toddler.
- 26.2.3 Create evidence-based educational interventions to promote self-care for health promotion, illness prevention, and illness management of newborns, infants, and toddlers.
- 26.2.4 Identify Healthy People 2030 goals established for the newborn, infant, and toddler.
- 26.2.5 Describe health promotion and disease prevention actions applicable to the newborn, infant, and toddler.
- 26.2.6 Discuss evidence-based strategies for integrating sociocultural and linguistically responsive health promotion and disease prevention interventions in clinical practice of the newborn, infant, and toddler.

Newborns, infants, and toddlers (children aged 0 to 3 years) undergo rapid developmental changes in their first years of life. Addressing their health needs helps them reach critical developmental milestones, such as sitting, crawling, and walking. This age group is more susceptible to illnesses and infections than older children due to immature immune systems. Addressing their health needs can help prevent illness or its complications and ensure they receive appropriate medical care. Managing health needs early on can help prevent the later development of chronic health conditions. Additionally, when the nurse provides education that allows caregivers to feel confident in their ability to care for their child, they are better equipped to provide the necessary care and support. Finally, addressing this population's health needs can have broader social and economic benefits. Healthy children are more likely to become healthy adults, leading to a more productive and economically stable society (Office of Child Care, n.d.; Prenatal-to-3 Policy Impact Center, 2021)

National and Global Status of Newborn, Infant, and Toddler Health

Many statistics are gathered regarding newborn, infant, and toddler health. Beyond the infant mortality rate, the United States gathers other data that illustrate the health of this population. The CDC divides data into infants and children up to age 4. According to the National Center for Health Statistics (NCHS, 2023c), in 2022, 1.5 percent of children in the United States aged 0 to 4 years were in fair or poor health, and 97.5 percent of children in the United States aged 0 to 4 years had a usual place of health care. In 2021, 3,816 deaths occurred in children aged 1 to 4 years, which is 25 deaths per 100,000 (NCHS, 2023c). The leading causes of death in this population were accidents (unintentional injuries); congenital malformations, deformations, and chromosomal abnormalities; and assault (homicide) (NCHS, 2023c).

Globally, most data are provided for children aged 0 to 5, and various other statistics are used to provide a snapshot of the health of this population. These include (World Bank Group, 2023):

- Prevalence of anemia: 40 percent (2019)
- Prevalence of wasting (low weight for height): 6.8 percent (2021 and 2022)
- Prevalence of severe wasting (low weight for height more than 3 standard deviations below the median): 2.1 percent (2022)
- Prevalence of underweight (low weight for age): 12.3 percent (2022)
- Global mortality rate: 28 deaths per 1,000 live births (2021)
 - Males: 31 deaths per 1,000 live births
 - Females: 26 deaths per 1,000 live births

One outlier of the data collection is immunization rates, as this is reported in children aged 12 to 23 months.

According to the World Bank Group (2023), 81 percent of this global population was immunized for diphtheria, pertussis, and tetanus (DPT) and 82 percent for measles in 2021.

According to the WHO (2023b), in 2018, 5.3 million children under age 5 died, nearly half of them in sub-Saharan Africa. Globally, this population's leading causes of death are preterm birth complications, pneumonia, birth asphyxia, diarrhea, and malaria (WHO, 2023b). More than half of deaths in this age group result from preventable diseases that are treatable through simple and affordable interventions, such as vaccines and adequate nutrition, particularly early and continued breastfeeding. Nutrition-related factors contribute to about 45 percent of deaths in this population (WHO, 2023b). Data regarding immunizations and nutrition coverage worldwide can be viewed at the [Maternal, Newborn, Child, and Adolescent Health and Ageing \(<https://openstax.org/r/platform>\)](https://openstax.org/r/platform) data portal.

Risk Factors Influencing the Health of Newborns, Infants, and Toddlers

Risk factors for this population are numerous, and the previous section discussed some of them. A lack of prenatal care, the lack of immunizations during pregnancy, and continuing to smoke or use alcohol are some behaviors of the childbearing client that will lead to an increased risk of health problems for their child. At the time of birth, if the delivery does not occur in a health facility with a skilled birth attendant, this is a risk factor. Other risks to child health include not breastfeeding, malnutrition, overcrowded conditions, unsafe drinking water and food, and poor hygiene practices. Finally, a lack of knowledge regarding safety and a lack of identifying and seeking appropriate care for illnesses in this population can lead to poor health outcomes (WHO, 2023b). While these may sound like risk factors for lower socioeconomic income regions, many are risk factors in the United States. Many risk factors for this population are often interconnected and can have cumulative effects on children's health and development. See

[Social Determinants Affecting Health Outcomes](#) for more risk factors for this population.

Educational Interventions to Promote Care in Newborns, Infants, and Toddlers

Educational interventions focus on this population's parents or caregivers and target preventing their leading causes of death and morbidity and the risk factors previously identified. Nurses play a critical role by providing caregivers with education on preventing unintentional injuries or accidents in this population. Education may involve safe sleep, play, and medication administration; sibling interactions, family members, and other visitors; and motor vehicle safety. Other significant topics of education include:

- Immunizations
- Nutrition (including the promotion of breastfeeding and healthy foods and drinks in early feeding)
- Oral health care
- Avoidance of exposure to environmental hazards (including lead, secondhand smoke, access to drugs and alcohol, firearms, violence, and trauma)
- Importance of recognizing abnormalities or illness in newborns, infants, and toddlers
- Developmental milestones for the age group as well as developmental needs to promote the attainment of these milestones

LEARN THE SIGNS, ACT EARLY TOOLS, AND RESOURCES

[Access multimedia content \(<https://openstax.org/books/population-health/pages/26-2-newborn-infant-and-toddler-health>\)](https://openstax.org/books/population-health/pages/26-2-newborn-infant-and-toddler-health)

Visit the CDC webpage [Learn the Signs. Act Early. \(<https://openstax.org/r/ncbddd>\)](https://openstax.org/r/ncbddd) to learn more about the CDC's various milestone tools and resources for caregivers, early learning center providers, health care providers, and other population health professionals, and view the following videos:

- CDC's Milestone Tracker Promotional Video
- Milestones Matter for Families!
- "Learn the Signs. Act Early." One Director's Story
- "Learn the Signs. Act Early." One Doctor's Story

Watch the videos, and then respond to the following.

1. Describe one benefit of using the tools and resources for caregivers.
2. Describe one benefit of using the tools and resources for early learning center providers.
3. Describe one benefit of using the tools and resources for nurses and other health care providers.

At the toddler stage, nurses may provide some age-appropriate health education directly to the child. Education should focus on helping them develop healthy habits and understand basic health and wellness concepts. [Table 26.5](#) provides some examples of age-appropriate health education topics for this population.

Topic	Education to Toddlers	Rationale
Personal Hygiene	Teach how to wash their hands, brush their teeth, and bathe properly	Good hygiene habits can help prevent the spread of germs and infections.
Nutrition	Encourage to eat a balanced diet including fruits, whole grains, and lean proteins; teach about healthy snacks and the importance of drinking plenty of water	Eating a balanced diet early can help develop a positive attitude toward food, recognize hunger and fullness cues, and build a strong foundation for healthy eating.
Physical Activity	Teach about the importance of active play, such as running, jumping, and climbing with supervision, as fun ways to stay active	Physical activity will help them develop strong bones and muscles and assist in the development of coordination and balance.

TABLE 26.5 Age-Appropriate Health Education for Toddler Clients

Topic	Education to Toddlers	Rationale
Safety	Teach basic safety rules, such as not touching hot stovetops or electrical outlets, wearing a helmet when riding a bike, being buckled into the car seat when riding in a vehicle, and looking both ways before crossing a street	Making safety a part of daily life will allow them to become aware of dangers to avoid and simple solutions for how to avoid them.
Emotional Wellness	Teach how to express their emotions in healthy ways, such as talking about their feelings, taking deep breaths when they feel upset, and going to a quiet space when overwhelmed; educate about the importance of getting enough sleep and rest	Those who are socially and emotionally healthy tend to demonstrate and continue to develop several important behaviors and skills they can use in social settings.

TABLE 26.5 Age-Appropriate Health Education for Toddler Clients

When developing education for toddlers, the nurse should consider their short attention spans and recognize that they cannot understand complex health concepts. Ways to provide simple and interactive education may include songs, games, role-play with dolls or stuffed animals, and storytelling. Separation from parents or caregivers may cause anxiety, so this should also be considered (UCSF Benioff Children's Hospital, 2023a).

Healthy People 2030 Goals for Newborns, Infants, and Toddlers

Childhood, particularly the early years, is a critical period for growth and development. Experiences, behaviors, and health problems can have long-term impacts during the infant and toddler years. Healthy People 2030 focuses on directly and indirectly improving health, safety, and well-being during this time. These include timely developmental screenings and recommended health services and the development of positive health behaviors, such as getting enough sleep and nutrition, to prevent diseases and injuries. Unfortunately, there are racial/ethnic and income disparities in the United States that impact these behaviors. To address these disparities, it is necessary to focus health promotion and prevention strategies on families, early childhood education programs, and neighborhoods.

HEALTHY PEOPLE 2030

Healthy People 2030 Objectives for Infants and Toddlers

[Healthy People 2030 Infants Objectives](https://openstax.org/r/infants) seek to “improve the health and safety of infants” (ODPHP, n.d.-c, para. 1). The health of the childbearing client before, during, and after pregnancy impacts their child’s health and well-being through their first year of life. After birth, many of the strategies to promote health focus on increasing breastfeeding rates, promoting vaccinations, promoting developmental screenings, encouraging safe sleep practice, and encouraging the correct use of car seats during transportation.

[Healthy People 2030 Children Objectives](https://openstax.org/r/healthchildren) address outcomes for those aged 1 through 19. Some objectives are geared specifically toward the toddler years. These include objectives related to vision, hearing, and developmental screenings; reducing emergency department visits for medication overdoses or asthma; reducing blood lead levels; reducing iron deficiency; increasing service access to children with autism spectrum disorder; increasing physical activity; and increasing vaccination rates (ODPHP, n.d.-b).

Health Promotion and Disease Prevention Activities to Improve the Health of Newborns, Infants, and Toddlers

Health promotion activities are necessary to improve the health and well-being of this population. The nurse should encourage people to breastfeed their newborns exclusively for the first six months of life, as breast milk provides all the necessary nutrients and antibodies for optimal growth and development (U.S. Department of Agriculture, 2020). Nurses should also ensure that children in this age group receive all the recommended immunizations to protect against serious infectious diseases and all the recommended screenings to identify health issues early. Various genetic, endocrine, and metabolic disorders; hearing loss; and critical congenital heart defects screenings are provided to newborns before discharge home after a hospital or birthing-center birth (CDC, 2021n). Nurses should encourage caregivers to maintain regular checkups with a health care provider for their child throughout this time

frame to monitor their growth and development and address any health concerns or developmental delays.

Nurses should promote safe infant sleep practices to prevent **sudden unexpected infant death** (SUID). SUID is the umbrella category that describes all sudden, unexpected infant deaths from known causes, such as injury or accident, and those from unknown causes (Eunice Kennedy Shriver NICHD, n.d., para. 2). **Sudden infant death syndrome** (SIDS) is defined as the sudden death of a baby younger than 1 year of age that does not have a known cause even after full investigation (Eunice Kennedy Shriver NICHD, n.d., para. 3). About 3,400 babies in the United States die from SUID annually, including those from SIDS, accidental suffocation in a sleeping environment, and other deaths from unknown causes (CDC, 2022h).

CLIENT TEACHING GUIDELINES

Prevention of SUID

The community health nurse should teach caregivers to do the following:

- Place the infant on their back for all sleep—naps and at night.
- Use a firm, flat (not angled or inclined) sleep surface, such as a mattress in a safety-approved crib, covered by a fitted sheet.
- Keep your baby's crib or bassinet in the same room where you sleep until the infant is at least 6 months old.
- Keep soft bedding such as blankets, pillows, bumper pads, and soft toys out of the infant's sleep area.
- Do not cover the infant's head or allow the infant to get too hot while sleeping.
- Do not smoke or use nicotine during pregnancy, and do not smoke or allow smoking around the infant.
- Do not drink alcohol or use illegal drugs during pregnancy.
- Feed the infant breast milk.
- Visit the infant's health care provider for regular checkups and immunizations.
- Offer your infant a pacifier at naptime and bedtime. If breastfeeding, consider waiting to use a pacifier until breastfeeding is well established.

(See CDC, 2022i.)

Once the child is older and eating solid foods, nurses should encourage caregivers to provide a nutritious diet to promote healthy growth and development. Encourage physical activity to promote motor skills development and reduce the risk of obesity. Promoting oral health includes brushing teeth twice a day and scheduling regular dental checkups. Finally, the nurse should support caregivers in positive mental health practices, such as providing a safe and nurturing environment, fostering positive relationships, and seeking help if needed (CDC, 2022j).

Injury prevention education is imperative to reduce the risk of accidents and injuries in the infant population (CDC, 2022a). The CDC has a variety of fact sheets on [safety in the home and community \(<https://openstax.org/r/cdcinfants>\)](https://openstax.org/r/cdcinfants) for infants and toddlers. These include carbon monoxide poisoning prevention, child passenger safety, safe places for childcare, emergency preparedness, food safety, medicine safety, sun safety, and water safety.

Health promotion activities for this population should also include education on preventing physical, sexual, and emotional child abuse and neglect, incorporating the following strategies (CDC, 2022a):

- Interventions that can assist parents in strengthening household financial security
- Family engagement
- Referral to quality childcare agencies that are licensed or accredited
- Education regarding parenting skills and family relationships
- Behavioral parent training programs

Abusive head trauma (AHT), which includes shaken baby syndrome, is a preventable, life-threatening form of physical child abuse that injures an infant's or child's brain and can lead to serious brain injury or death (National Center for Chronic Disease Prevention and Health Promotion, 2022a). AHT typically occurs when a caregiver forcefully shakes or jerks an infant or young child. Infants' vulnerable neck muscles and large, heavy heads make them particularly susceptible to injury. AHT can happen in a matter of seconds, even with seemingly minor force.

Injuries that can result from AHT include subdural hematomas (bleeding between the brain and its protective coverings), diffuse axonal injury (widespread damage to nerve fibers in the brain, disrupting communication between brain cells), retinal hemorrhages (bleeding in the retina, which lines the back of the eye), cerebral edema (swelling of the brain), and/or skull fractures. These injuries can lead to long-term consequences such as developmental delays, intellectual disabilities, seizures, and even death.

Preventing AHT requires a multifaceted approach involving education, awareness, and support. Nurses should identify at-risk families and provide appropriate intervention and support services, including information about the dangers of shaking infants and alternative strategies for soothing a crying baby. Offering resources and support for caregivers, including stress management techniques, counseling services, and parenting classes, can help reduce frustration and improve coping mechanisms. It is mandatory that any suspected case of child abuse is reported to the appropriate services (National Center for Chronic Disease Prevention and Health Promotion, 2022a).

A variety of information for caregivers of infants and toddlers (aged 0 to 3) can be found at the CDC (2022a) [Parent Information website \(<https://openstax.org/r/cdcparents>\)](https://openstax.org/r/cdcparents). This website discusses the above topics in greater detail and provides schedules for developmental milestones, growth charts, and immunizations.

In addition to the strategies to prevent congenital disorders and prenatal infections discussed in this section, other newborn concerns include jaundice and vitamin K deficiency. As the child moves out of the newborn stage, other diseases and conditions, such as developmental delays, developmental disabilities, and infections, are a concern. Nurses should educate caregivers on how to prevent or detect these diseases and conditions early to mitigate complications (CDC, 2022f).

A child with a developmental delay has not gained the skills or reached the milestones that experts expect of children their age. Most developmental delays resolve independently over time (Cleveland Clinic, 2023b). Examples include delays rolling over, sitting up, crawling, and walking; trouble with fine motor skills; difficulty understanding or communicating with others; or a lack of age-appropriate social skills. Nurses should encourage caregivers to speak to their pediatrician immediately if they suspect a developmental delay or deviation from expected milestones (CDC, 2022f). Developmental screening can detect delays early, ensuring the child has early intervention services and allowing them to catch up to their peers and reach their full potential. A referral to an appropriate health care provider, such as an audiologist, speech therapist, developmental pediatrician, neurologist, physical therapist, occupational therapist, or another provider of early intervention services, may also be necessary. Early intervention is the best way to prevent long-term developmental delays or disabilities. If the child is eligible, a care team will develop an Individualized Family Service Plan (IFSP) based on the child's and family's particular needs.

Developmental disabilities are “a group of conditions due to an impairment in physical, learning, language, or behavior areas, which begin during the developmental period, may impact day-to-day functioning, and usually last throughout the lifetime” (CDC, 2022f, para. 1). They often begin before birth, but some can occur after birth due to injury, infections, or other factors. The cause of some developmental disabilities is unknown. Still, they are believed to be caused by a combination of factors, including genetics, parental health and behaviors during pregnancy, complications during birth, maternal infections during pregnancy, infant infections early in life, and exposure of the pregnant person or child to environmental toxins (CDC, 2022f). About one in six, or 17 percent, of children aged 3 through 17 years have one or more developmental disabilities, according to the CDC (2022f). These occur among all racial, ethnic, and socioeconomic groups. Examples include attention deficit hyperactivity disorder (ADHD), autism spectrum disorder, cerebral palsy, fragile X syndrome, Tourette syndrome, hearing loss, intellectual disabilities, learning disabilities, and vision impairment.

Infectious disease prevention in this population is very similar to any infectious disease prevention. Nurses should encourage caregivers to limit visitors during the newborn stage, especially those who are sick. Children younger than 2 are at especially high risk of developing complications from infections such as influenza, respiratory syncytial virus (RSV), or COVID-19 (CDC, 2022l). Anyone with cold-like symptoms should be taught to avoid close contact, follow cough etiquette, wash their hands often with soap and water for at least 20 seconds, and clean frequently touched surfaces. Avoiding infection can prevent complications such as pneumonia, myocarditis, and sepsis.

Primary Prevention

Primary prevention involves taking measures to prevent health problems or injuries. There are a variety of primary preventions that can be taken for newborns, infants, and toddlers. Some examples include:

- [Immunizations per the recommended schedule \(https://openstax.org/r/cdcvaccines\)](https://openstax.org/r/cdcvaccines) (CDC, 2023b)
- Breastfeeding exclusively through age 6 months
- Placing newborns and infants to sleep on their backs
- Proper car seat use for infants and toddlers until they are at least 2 years old or until they reach the highest weight or height permitted by the car seat manufacturer
- Good handwashing by the caregiver or toddler
- Regular medical checkups

Primary prevention as early as possible in infancy can also promote health and prevent the development of chronic diseases later in life (National Center for Chronic Disease Prevention and Health Promotion, 2022a).

Secondary Prevention

Secondary prevention measures identify problems as early as possible, usually before symptoms arise. Some examples of appropriate secondary prevention measures for newborns, infants, and toddlers include:

- Developmental screenings
- Hearing and vision screenings
- Early intervention services
- Violence screening aimed at protecting children who live in high-risk environments where overt abuse has not yet occurred but is likely to occur in the future
- Testing newborns for bilirubin levels

Tertiary Prevention

Tertiary prevention aims to minimize the negative impacts of an existing health condition or disability. For newborns, infants, and toddlers, tertiary prevention might include:

- Rehabilitation services, such as physical therapy, occupational therapy, and speech therapy, can assist in improving the function of those with developmental disabilities.
- Medical or surgical interventions, such as surgery, medication, and medical devices, may be needed to manage congenital heart defects, hyperbilirubinemia, or other conditions.
- Nutritional support, such as feeding tubes, special diets, or supplements, may be needed if the child has feeding difficulties or gastrointestinal issues.
- Behavioral interventions, such as parent training, behavior modification, or social skills training, can help with behavioral issues in toddlers.
- Supportive services, such as respite care, counseling, and support groups, can help families cope with the challenges of caring for a child with a disability.

Integration of Sociocultural and Linguistically Responsive Interventions for Newborns, Infants, and Toddlers

Ensuring that health promotion and disease prevention interventions are culturally and linguistically appropriate can positively impact the overall well-being of this population. Cultural and linguistic diversity itself impacts child development. Language and culture shape a child's cognitive, social, and emotional development. Because of this, the nurse should understand the importance of building relationships with the child and their caregivers, recognize cultural and linguistic diversity, and value family involvement.

The National Center on Parent, Family, and Community Engagement (2020), part of the HHS Administration for Children and Families, has recently focused on learning how understanding families' cultural perspectives can help build positive relationships. Nurses who work with families in this way can strengthen family engagement efforts.

Family engagement is the process used to build genuine relationships with families to promote strong parent-child relationships, family well-being, and better outcomes. Understanding families' cultural beliefs, values, and priorities is the key to the family engagement process. The distinct family cultures provide meaning and direction to the lives of children. The various factors influencing families' cultural beliefs will inform decisions about the child and the family, including health care and education decisions.

THEORY IN ACTION

Partnerships for Change: Listening to the Voices of Families

[Access multimedia content \(<https://openstax.org/books/population-health/pages/26-2-newborn-infant-and-toddler-health>\)](https://openstax.org/books/population-health/pages/26-2-newborn-infant-and-toddler-health)

This video shows how one program effectively partnered with families and local organizations to build a strong community to contribute to community wellness, family well-being, and children's healthy development.

As you watch the video, look for examples of the following:

Strategies

- Community partnerships
- Family partnerships
- Committed program leadership
- Culturally responsive program environment

Outcomes

- Positive goal-oriented relationships with families
- Family well-being
- Families as advocates and leaders
- Family connections to peers and community

The Public Education Foundation (2015) video [Literacy, Early Learning & Family Engagement \(<https://openstax.org/r/literacy>\)](https://openstax.org/r/literacy) provides another glimpse of collaboration between families, educators, and health care professionals.

Sociocultural Interventions

Sociocultural interventions for this population should aim to create a safe, welcoming, and inclusive environment that recognizes and values the unique background of each child and their family. Before working with this population, nurses should benefit from training in recognizing and respecting applicable cultural differences. Family-centered care is a specific type of family engagement, described above. Family-centered care involves working collaboratively with families to understand their cultural preferences and needs to provide health care that is sensitive to their beliefs, values, and traditions. This approach may prove helpful when caring for newborns, infants, and toddlers as it promotes shared decision-making and respect between the family and the nurse.

When performing interventions with infants and toddlers, nurses should celebrate diversity. This may involve incorporating clients' cultures through books, music, art, or other activities. Nurses can adapt play-based interventions to various cultures to support children's cognitive, social, and emotional development. Golsäter et al. (2023) refer to this as "the ability to culturally adjust the health care" (p. 1431).

Linguistically Responsive Interventions

For families who speak languages other than the community's dominant language, providing bilingual education and language support can be useful in fostering the child's development. For example, a nurse could provide materials in the client's home language and then work with bilingual staff to support communication with the family. Once again, competence training for the nurse, focused on linguistic differences, may help the nurse provide care that is responsive to the unique needs of each child and their family.

Fibla et al. (2022) describe how babies begin to learn and develop language before birth, and for many children, this includes learning multiple languages. By the year 2060, it is estimated that Latino children will constitute one-third of the three-to-four-year-old population, many of whom are **dual language learners** (DLLs) (Unidos U.S., 2020). DLLs are children learning two or more languages simultaneously or learning a second language while still learning their first language (Head Start, 2023). The language one speaks is instrumental in forming one's identity, and many bilingual infants with high levels of support for both languages grow to become highly proficient in both (Fibla et al., 2022). Fibla et al. (2022) also described research that found DLLs positively contribute to reading and oral language skills across languages. They recommend the use of linguistically responsive practices to:

- promote the visible respect and value of all languages;
- encourage family members to support their child's continued home language development;
- accept all instances of communication from a child—especially when they mix two languages, known as **code-switching**, which should be recognized as a strength rather than a problem;
- support every child to develop secure and nurturing relationships regardless of their home language or prior experience with English; and
- support the continued development of a child's home language and the acquisition and development of English.

26.3 Preschool, School-Age, and Adolescent Health

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 26.3.1 Assess the global and national health status of preschool, school-age, and adolescent health.
- 26.3.2 Examine major risk factors influencing the health of the preschool, school-age, and adolescent population.
- 26.3.3 Create evidence-based educational interventions to promote self-care for health promotion, illness prevention, and illness management of preschool and school-age children and adolescents.
- 26.3.4 Identify Healthy People 2030 goals established for preschool, school-age, and adolescent health.
- 26.3.5 Describe health promotion and disease prevention actions applicable to preschool, school-age, and adolescent health.
- 26.3.6 Discuss evidence-based strategies for integrating sociocultural and linguistically responsive health promotion and disease prevention interventions in clinical practice of preschool, school-age, and adolescent health.

The preschool, school-age, and adolescent population includes children aged 4 to 17. Health promotion and disease prevention are important for children in this age range as this is a crucial period of growth and development when children form habits and behaviors that will impact their health and well-being throughout their lives. Children who learn healthy habits early are more likely to continue them into adulthood. Many chronic diseases, such as diabetes, heart disease, and obesity, begin in childhood. Helping children develop these healthy habits and behaviors may reduce their risk of such diseases occurring. Children are also building strong bones and muscles, which will reduce their risk of injury as they age. Finally, children in this age group are developing the social and emotional skills they will take into adulthood. For example, children build self-esteem and confidence by participating in physical activity such as sports. Learning good hygiene practices can help build social skills and respect for others (National Center for Chronic Disease Prevention and Health Promotion, 2022b).

National and Global Status of Preschool, School-Age, and Adolescent Health

There are wide differences between children aged 4 and children aged 17. As such, health data for this population are often divided into different groups. [Table 26.6](#) presents some of the health data from the National Center for Health Statistics. Additional U.S. health data for children and adolescents can be seen at the [Health, United States, 2020–2021 – Data Finder \(<https://openstax.org/r/cdcnchs>\)](#).

	Children	Adolescents
Health Status		
Percent of children who are in fair or poor health (2022) as identified by asking adults “Would you say [child’s name]’s health in general is excellent, very good, good, fair, or poor?”	2.2% Ages 5 to 11	3.8% Ages 12 to 17
Percent of children who missed 11 or more days of school in the past 12 months due to illness, injury, or disability (2022)	8% Ages 5 to 11	9.9% Ages 12 to 17
Obesity		
Percent of children who are obese (2017–March 2020)	20.7% Ages 6 to 11	22.2% Ages 12 to 19

TABLE 26.6 Selected U.S. Health Data for Children Aged 4 to 17 (See NCHS, 2023a, 2023b, 2023c.)

	Children	Adolescents
Access to Care		
Percent of children with a usual place of health care (2022)	97.2% Ages 5 to 11	96.4% Ages 12 to 17
Mortality		
Number of deaths (2021)	5,975 Ages 5 to 14	13,407 Ages 15 to 19
Deaths per 100,000 population (2021)	14.3 Ages 5 to 14	62.2 Ages 15 to 19

TABLE 26.6 Selected U.S. Health Data for Children Aged 4 to 17 (See NCHS, 2023a, 2023b, 2023c.)

Immunization rates affect child and adolescent health. Rates for certain vaccinations (measles, mumps, and rubella; varicella; diphtheria; tetanus; and acellular pertussis) decreased by 1 percent from the 2020–2021 school year to the 2021–2022 school year in incoming kindergarteners (Seither et al., 2022). For 2021–2022, 2.6 percent of kindergarteners were exempted from at least one state-required vaccination per their caregivers’ requests.

CHILD VACCINATION ACROSS AMERICA

The American Academy of Pediatrics interactive map, “[Child Vaccination Across America \(https://openstax.org/r/downloads\)](https://openstax.org/r/downloads),” allows viewers to compare state and national immunization rates.

Visit the map, and do the following:

1. Watch the video “How to explore the interactive map.”
2. Hover over your state and learn about the percentage of children immunized by the various vaccines. How does your state compare with the national rates?
3. Hover over one area designated with a recent disease outbreak, and then click on the area to learn more about this specific disease and outbreak.
4. Click on the “Explore Data” button and learn more about vaccination gaps related to insurance, race and ethnicity, poverty, and geographic area.
5. Were you surprised by what you learned? Why or why not?

Global health data regarding immunizations is not promising. A 2022 systematic review confirmed a worldwide decline or delay in vaccination during the COVID-19 pandemic (SeyedAlinaghi et al., 2022). This followed indications that 13.5 million children were not vaccinated in 2018 (Vanderslott et al., 2022). Although there has been a global decline in vaccine-preventable diseases (VPDs), they are still responsible for 1.5 million deaths annually. Although studies have found that most people worldwide think that vaccines are important for children to have, support for vaccination varies (Vanderslott et al., 2022). This is described further in [Pandemics and Infectious Disease Outbreaks](#).

Globally, obesity in children aged 5 to 19 is considered a major health concern as it is a significant risk factor for many noncommunicable diseases, including cardiovascular disease, diabetes, and some cancers (endometrial, breast, ovarian, prostate, liver, gallbladder, kidney, and colon) as well as for musculoskeletal disorders. In 2016, the WHO reported that the share of those aged 5 to 19 who are overweight or obese has increased from 4 percent in 1975 to around 18 percent in 2016. Also in 2016, over 340 million children and adolescents aged 5 to 19 were overweight or obese, while 39 million children under age 5 were overweight or obese in 2020 (WHO, 2021).

▶ CHILDHOOD OBESITY GLOBALLY

[Access multimedia content \(https://openstax.org/books/population-health/pages/26-3-preschool-school-age-and-adolescent-health\)](https://openstax.org/books/population-health/pages/26-3-preschool-school-age-and-adolescent-health)

Once considered a high-income country problem, overweight and obesity are now increasing in low- and middle-income countries, particularly in urban areas. For example, “in Africa, the number of overweight children under age 5 has increased by nearly 24 percent since 2000, and almost half of the children under age 5 who were

overweight or obese in 2019 lived in Asia” (WHO, 2021, para. 7). These low- and middle-income countries now face what the WHO refers to as a “double burden” of malnutrition. Children in these countries are more vulnerable to inadequate nutrition prenatally and as newborns and infants, and then they are introduced to “high-fat, high-sugar, high-salt, energy-dense, and micronutrient-poor foods, which tend to be lower in cost” (WHO, 2021, para. 12).

Watch the video, and then respond to the following questions.

1. What two lifestyle behaviors put children like Avoca at risk for obesity?
2. Children who are overweight or obese are at greater risk for developing which three diseases?
3. What is one solution that could decrease the consumption of cheap and unhealthy foods?

In 2020, the global mortality rate for those aged 5 to 14 was 7 per 1,000 children, and in 2021 the rate for those aged 15 to 19 was 4.6 per 1,000 (WHO, 2022b, 2022c). Infectious diseases have declined in the last decade for both groups. For those aged 5 to 14, injuries (including road traffic injuries and drowning) remain the leading causes of death and lifelong disability (WHO, 2022b). In those aged 15 to 19, accidents and injuries, self-harm, and interpersonal violence the leading causes of death (WHO, 2022b, 2022c).

Risk Factors Influencing Preschool, School-Age, and Adolescent Health

As children and adolescents grow and develop, numerous environmental, social, and physical risk factors can influence their health and well-being (see [Table 26.7](#)).

	Preschool	School Age	Adolescent
Environmental	<ul style="list-style-type: none"> • Exposure to lead and environmental toxins • Poor air quality • Inadequate access to clean water, sanitation, and healthy food • Poor housing conditions • Limited access to safe outdoor spaces 	<ul style="list-style-type: none"> • Noise pollution • All the same risk factors listed for the preschool population 	<ul style="list-style-type: none"> • Substance use and misuse • All the same risk factors listed for the preschool and school-age populations
Social	<ul style="list-style-type: none"> • Poverty and low socioeconomic status • Lack of access to quality early childhood education and care • Limited social support • Exposure to violence and crime • Family dysfunction • Discrimination and racism • Limited access to transportation and safe pedestrian infrastructure 	<ul style="list-style-type: none"> • Limited access to educational opportunities • Peer pressure and social norms • All the same risk factors listed for the preschool population 	<ul style="list-style-type: none"> • Stigma and discrimination related to sexual orientation, gender identity, and other aspects of identity • All the same risk factors listed for the preschool and school-age populations
Physical	<ul style="list-style-type: none"> • Prenatal and perinatal factors • Genetic factors • Infections and communicable diseases • Developmental delays and disabilities • Allergies and asthma • Chronic health conditions • Nutritional deficiencies or imbalances • Sleep disturbances 	<ul style="list-style-type: none"> • Hormonal changes during puberty • All the same risk factors listed for the preschool population 	<ul style="list-style-type: none"> • All the same risk factors listed for the preschool and school-age populations

TABLE 26.7 Risk Factors Influencing Health (See Centers for Disease Control and Prevention, 2021a, 2021b, 2021c, 2021d, 2021e.)

Environmental and social risk factors can have long-lasting effects on the health and development of this population (National Institute of Environmental Health Sciences [NIEHS], 2023). See [Social Determinants Affecting Health Outcomes](#) for more information. Physical or biological risk factors can also influence the health of the preschool, school-age, and adolescent population (Negussie et al., 2019). The same prenatal and perinatal factors and genetic factors mentioned previously can continue to affect children as they age. Any developmental delays or disabilities continue to impact cognitive, physical, and socio-emotional development. Infections and communicable diseases can adversely affect physical health acutely and can also lead to long-term health problems. Allergies and asthma have negative effects on respiratory health and quality of life. Other chronic health conditions have long-term health and development consequences. These may include diseases such as diabetes or congenital heart defects. Nutritional deficiencies or imbalances, including obesity, can impact growth, development, and overall health. Sleep disturbances may negatively influence cognitive and behavioral development (Negussie et al., 2019). Hormonal changes during puberty can impact physical, cognitive, and emotional development.

Lifestyle-related risk factors may play a huge role in a child's risk of developing some conditions, such as childhood cancers, ADHD, and asthma (American Cancer Society, 2019; Cleveland Clinic, 2023a; Mayo Clinic, 2019). As mentioned, childhood cancers are a leading cause of death for preschool and school-age children. Cancer prevention can begin prenatally and continue through early childhood. In addition to getting enough folic acid, avoiding alcohol and tobacco use prenatally, and breastfeeding postpartum, childbearing clients may lower a child's cancer risk through other behaviors (CDC, 2021k). Safe, stable, and nurturing relationships and environments can help protect children against many harms and ensure they reach their full potential. This includes keeping children away from exposures to secondhand smoke, traffic-related air pollution, carcinogens, and excessive radiation used during medical tests. However, many childhood cancers cannot be prevented (American Cancer Society, 2019).

ADHD and asthma are other common health concerns in this population. While there is no known cause for ADHD, prevention efforts involve addressing maternal substance use and misuse, premature birth, and exposure to environmental toxins (Mayo Clinic, 2019). Researchers have not determined the exact cause of childhood asthma, which often develops when the child's immune system is developing (Cleveland Clinic, 2023a). Asthma may have genetic components, and exposure to allergens, such as tobacco smoke, and viral infections, such as the common cold, at an early age have also been associated with its development in children (Cleveland Clinic, 2023a). Gender, racial, and geographic disparities also exist with individuals who are assigned male at birth, BIPOC children, and children who live in urban environments or around high amounts of air pollution at higher risk of developing asthma (Cleveland Clinic, 2023a).

Poor mental health can be a risk factor for substance misuse, sexual health issues, and suicide. Suicide is the second most common cause of death in those aged 10 to 14 years and the third most common cause of death in those aged 15 to 24 years (CDC, 2022r). Many factors can increase the risk for suicide or protect against it ([Table 26.8](#)). It is often connected to other forms of injury or violence. Those who have experienced violence such as child abuse, bullying, or sexual violence have a higher risk for a suicide attempt.

Circumstances That Increase Suicide Risk

Individual Risk Factors	<ul style="list-style-type: none"> • Previous suicide attempt • History of depression and other mental illnesses • Serious illness such as chronic pain • Criminal/legal problems • Job/financial problems or loss • Impulsive or aggressive tendencies • Substance misuse • Current or prior history of adverse childhood experiences (ACEs) • Sense of hopelessness • Violence victimization and/or perpetration
-------------------------	--

TABLE 26.8 Child and Adolescent Suicide (See Centers for Disease Control and Prevention, 2022r.)

Relationship Risk Factors	<ul style="list-style-type: none"> Bullying Family/loved one's history of suicide Loss of relationships High-conflict or violent relationships Social isolation
Community Risk Factors	<ul style="list-style-type: none"> Lack of access to health care Suicide cluster in the community Stress of acculturation Community violence Historical trauma Discrimination
Societal Risk Factors	<ul style="list-style-type: none"> Stigma associated with help-seeking and mental illness Easy access to lethal means of suicide among people at risk Unsafe media portrayals of suicide
Circumstances That Protect Against Suicide Risk	
Individual Protective Factors	<ul style="list-style-type: none"> Effective coping and problem-solving skills Reasons for living (family, friends, pets, etc.) Strong sense of cultural identity
Relationship Protective Factors	<ul style="list-style-type: none"> Support from partners, friends, and family Feeling connected to others
Community Protective Factors	<ul style="list-style-type: none"> Feeling connected to school, community, and other social institutions Availability of consistent, high-quality physical and behavioral health care
Societal Protective Factors	<ul style="list-style-type: none"> Reduce access to lethal means of suicide among people at risk Cultural, religious, or moral objections to suicide

TABLE 26.8 Child and Adolescent Suicide (See Centers for Disease Control and Prevention, 2022r.)

Adolescent girls and adolescents identifying as LGBTQIA+ experience high levels of violence, sadness, mental health challenges, and suicide risk (CDC, 2023k). In 2021, among adolescents, almost twice as many girls as boys reported persistent sadness or hopelessness ([Figure 26.2](#)), and nearly one in three girls reported that they had seriously considered attempting suicide (CDC, 2023c).

Percent of Teen Girls Who Reported Persistent Feelings of Sadness or Hopelessness Increased Sharply from 2011 to 2021

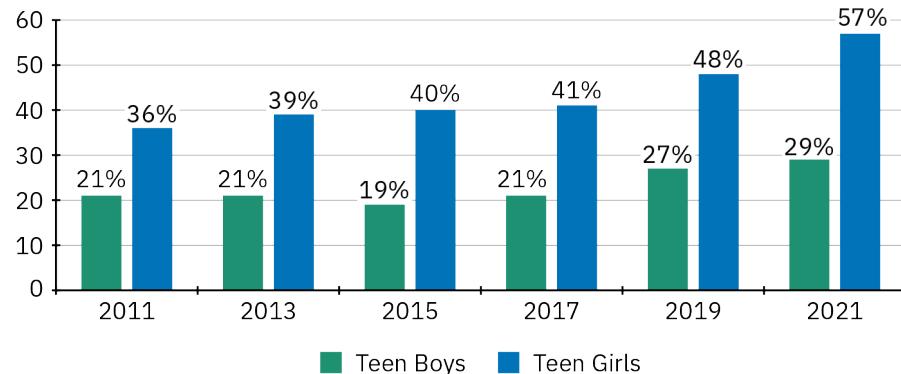

FIGURE 26.2 This graphic shows the increase in the percentage of adolescent boys and girls who persistently felt sad or hopeless over a 10-year period. (data source: CDC, 2023c; attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

Another area of health risk for this population is **concussion** or brain injury. Anyone who experiences a bump, blow,

or jolt to the head or hit to the body that causes the head and brain to move rapidly back and forth could suffer a concussion, with youth athletes particularly at risk (CDC, 2022b). School and community health nurses may educate youth athletes, caregivers, coaches, and officials in preventing concussions, recognizing their signs and consequences, and identifying a safe return to activity following a concussion.

Risk factors for adolescents related to sexual health include activities that can lead to adverse health outcomes such as HIV infection, other STIs, or pregnancy. **Sexual risk behavior** is any behavior—typically condom-unprotected oral, vaginal, or anal intercourse—that puts one at risk for these adverse health outcomes (Senn, 2020).

Recognizing these many risk factors that can adversely impact this population's health and well-being is the first step in promoting health. Children and adolescents from marginalized or disadvantaged backgrounds may be at higher risk for experiencing risk factors. The HEADSS (Home, Education, Activities, Drug use and abuse, Sexual behavior, Suicidality, and depression) for Adolescents tool is a psychosocial risk assessment instrument that health care professionals may find useful in finding out about issues in adolescents' lives (Cohen et al., 1991).

Educational Interventions to Promote Self-Care in Preschool, School-Age, and Adolescent Populations

Educational interventions geared toward this population and their caregivers should focus on preventing their leading causes of death and morbidity, and the risk factors identified above. To promote self-care and the development of healthy habits, nurses should provide education directly to the child or adolescent. Educating adults on how to support their child's development can be an effective way of introducing and maintaining the child's health. Educational interventions may occur as individual instruction, group workshops, or classes ([Table 26.9](#)).

	Education for the Caregiver	Education for the Child/ Adolescent	Education Techniques for the Child/Adolescent
Preschool	<ul style="list-style-type: none"> Regular health screenings and vaccinations Child development Safety and accident prevention Nutrition Positive discipline Mental health Encouragement to promote a healthy school environment 	<ul style="list-style-type: none"> Importance of physical activity Importance of healthy eating habits Proper hygiene practices Safety to prevent accidents and injuries (fire, water, automobile, pedestrian, and environmental navigation safety) 	<ul style="list-style-type: none"> Use imagination Explore through words, play, and fantasy Storytelling Music, movement, hands-on activities, and visual aids Include caregivers in education
School Age	<ul style="list-style-type: none"> All topics listed above Sexual education 	<ul style="list-style-type: none"> All topics listed above Nutrition (portion control, balanced diets) Safety to prevent accidents and injuries (bike and technology safety) Management of emotions Healthy communication and conflict management Substance misuse (risks and consequences and how to resist peer pressure) Sexual education (puberty, reproduction, contraception) 	<ul style="list-style-type: none"> Hands-on learning Role-play Technology-based learning (interactive games, videos, and simulations) Peer education (develops leadership skills and reinforces the importance of healthy behaviors) Include caregivers in education
Adolescent	<ul style="list-style-type: none"> All topics listed above 	<ul style="list-style-type: none"> All topics listed above Safety to prevent accidents and injuries (driving safety) Importance of healthy relationships to avoid dating violence Sexual education (contraception, STI prevention, consent) 	<ul style="list-style-type: none"> Open and interactive discussions about health issues Role-play Personalized goal setting Peer education Education provided via social media and other forms of technology Community involvement related to health issues that interest them Must build trust between the nurse and the client

TABLE 26.9 Educational Interventions for Preschool, School-Age, and Adolescent Populations (See UCSF Benioff Children's Hospital, 2023b; Vaivada et al., 2022.)

School nurses and school health programs are ideal for health promotion and disease prevention for this population, as described in [Caring Across Practice Settings](#). Schools have direct contact with 56 million students for at least six

hours daily during the most critical years of their development (CDC, 2020c). School health programs can decrease the prevalence of health risk behaviors by delivering quality sexual health education; increasing youth access to sexual health services; establishing healthy, safe, and supportive environments to promote positive mental health; and implementing policies that provide health promotion and disease prevention (CDC, 2020c).

Healthy People 2030 Goals for Preschool, School-Age, and Adolescent Health

Preschoolers and school-age children fall into the Healthy People 2030 overarching goal to “improve the health and safety of children” (ODPHP, n.d.-b, para. 1), as described in the section on toddlers. There are some additional Healthy People Objectives for preschoolers and even more for the school age and adolescent ranges.

HEALTHY PEOPLE 2030

Children

Healthy People 2030 [children objectives](https://openstax.org/r/content) (<https://openstax.org/r/content>) address outcomes for those aged 1 through 19. There are specific objectives geared toward the population in the preschool and school-age years. Some of these are related to vision and developmental screenings; trauma, literacy, early childhood education, nutrition, and other school programs; decreasing obesity; increasing physical activity and promotion of sports; mental health treatment; preventive dental care; and violence prevention.

The overarching goal of Healthy People 2030 related to adolescents is to “improve the health and well-being of adolescents” (ODPHP, n.d.-a, para. 1). Improving adolescent health can prevent some behaviors that can affect health later in life. Adolescents have many risk factors, many of which are preventable, including substance use disorders, STIs, and injuries from motor vehicle accidents. The physical and mental changes occurring during adolescence can also impact their safety and health. Encouragement of positive health behaviors is essential in this population. Therefore, there are many Healthy People 2030 objectives geared toward adolescents.

HEALTHY PEOPLE 2030

Adolescents

Healthy People 2030 addresses outcomes specifically for [adolescents](https://openstax.org/r/adolescents) (<https://openstax.org/r/adolescents>). Some are related to school achievement, adult support, family planning, oral care, transition to adult health care, LGBTQIA+ health issues, mental health disease issues, sleep, and the prevention of chronic kidney disease, chronic school absence, infectious diseases, obesity, skin cancer, STIs, tobacco and other substance use, and violence.

Health Promotion and Disease Prevention Activities to Improve the Health of Preschool, School-Age, and Adolescent Populations

Improving the health of this population is an important public health goal. Health promotion activities, such as the education previously described, can play a crucial role in achieving this goal. Nurses can promote positive health outcomes by enabling this population to increase control over their health and its determinants as they age. Activities can include various interventions to promote healthy behaviors, prevent diseases and injuries, and improve health care access and may occur in various settings, including schools, health care facilities, community centers, and homes. Examples include education and awareness campaigns, nutrition and physical activity interventions, mental health interventions, and health care access initiatives. By implementing these interventions, nurses can help promote healthy behaviors and improve children’s and adolescents’ overall health and well-being.

The CDC (2021a, 2021b, 2021d, 2021e) website provides information for caregivers of [children ages 4 to 11](https://openstax.org/r/cdcchildren) (<https://openstax.org/r/cdcchildren>) and for [teens](https://openstax.org/r/teens) (<https://openstax.org/r/teens>). These pages discuss the topics in greater detail and provide specific schedules for growth charts and immunizations.

Disease prevention promotes healthy growth and development by supporting children’s and adolescents’ physical and cognitive growth and development. By protecting this population from illnesses, the nurse can help them reach

their full potential (ODPHP, n.d.-a). Preventing diseases also helps reduce health care costs through a lesser need for medical treatment or hospitalizations. Healthy children and adolescents are more likely to have good academic performance with less absenteeism, positively influencing their academic lives and contributing to their future professional lives. By preventing certain diseases, nurses help to protect this population's long-term health and the wider community by reducing the spread of infectious diseases (ODPHP, n.d.-a).

Because some of the most common preventable diseases affecting this population include COVID-19, influenza, and obesity, health promotion and applicable prevention efforts should target them. Preventing accidents, homicides, and suicides is also imperative for this population. School-age children must also combat other infectious diseases, most notably chicken pox. Adolescents and their caregivers should receive preventive services related to anxiety and depression, substance misuse, violence, blood clots, cervical cancer, and STDs (CDC, 2021d).

Primary Prevention

Prevention of disease onset occurs through primary prevention. It is an essential way to promote the health and well-being of the preschool, school-age, and adolescent population. Some examples of primary prevention include:

- [Immunizations per the recommended schedule \(https://openstax.org/r/child\)](https://openstax.org/r/child) (CDC, 2023b). Additional information can be seen at the [American Academy of Pediatrics' Childhood and Adolescent Vaccine Education Series \(https://openstax.org/r/playlist\)](https://openstax.org/r/playlist) playlist on YouTube.
- Hand hygiene, such as washing hands frequently with soap and water to prevent the spread of germs.
- Healthy eating habits, such as eating plenty of fruits and vegetables to support their immune system and promote growth and development.
- Sun protection to prevent skin damage and cancer from sun exposure.
- Regular physical activity to promote overall health and well-being and prevent the development of obesity.
- Injury prevention, including providing safe play environments for preschoolers, bike safety for school-age children, and driving safety for adolescents.
- Sexual health education to prevent STDs and unintended pregnancies.
- Mental health promotion, including stress management and coping skills to prevent anxiety, depression, and suicide.
- Substance misuse prevention, including the risks and consequences.
- Violence prevention, including adverse childhood experiences (ACEs), child abuse and neglect, child sexual abuse, firearm violence, intimate partner violence, sexual violence, and youth violence prevention to prevent violence before it actually occurs or buffer people from violence.

THEORY IN ACTION

Adverse Childhood Experiences (ACEs)

The CDC's (2021m) VetoViolence® resources empower people to prevent violence and implement evidence-based prevention strategies in their communities. In particular, the CDC infographic, "[We Can Prevent Childhood Adversity \(https://openstax.org/r/acesinfographic\)](https://openstax.org/r/acesinfographic)," addresses adverse childhood experiences, or ACEs.

Examine the infographic, and then respond to the following questions.

1. What are ACEs?
2. What groups are more likely to experience ACEs?
3. What are two ways to create positive childhood experiences?

Secondary Prevention

Secondary prevention measures identify problems as early as possible, usually before symptoms arise. Some examples of these for the preschool, school-age, and adolescent population include:

- Regular health checkups, including dental, vision and hearing as applicable, to help identify any health issues early and ensure appropriate medical care is received
- [Recommended screenings \(https://openstax.org/r/periodicity\)](https://openstax.org/r/periodicity) for the age group as per the American Academy of Pediatrics or the U.S. Preventive Services Task Force [guidelines \(https://openstax.org/r/uspstftopic\)](https://openstax.org/r/uspstftopic)
- Immediately after a violent event, addressing any short-term consequences and focusing on the immediate

needs such as emergency services or medical care

Tertiary Prevention

Tertiary prevention involves managing and treating health issues that have already developed to minimize their impact and prevent further complications. Here are some examples of tertiary prevention activities for preschoolers, school-age children, and adolescents:

- Provide early intervention services such as speech therapy or occupational therapy for preschoolers with developmental delays or disabilities
- Manage asthma symptoms and provide treatment to prevent attacks and minimize the impact of the disease
- Provide appropriate mental health treatment to help children or adolescents manage symptoms and improve their quality of life
- Provide emotional support or mental health services long-term following a violent event to decrease trauma to the victim

THEORY IN ACTION

Addressing Youth Violence

[Access multimedia content \(<https://openstax.org/books/population-health/pages/26-3-preschool-school-age-and-adolescent-health>\)](https://openstax.org/books/population-health/pages/26-3-preschool-school-age-and-adolescent-health)

Youth violence is a significant public health problem affecting thousands of young people each day, including their families, schools, and communities. Youth violence is widespread in the United States and is the third leading cause of death for young people between the ages of 10 and 24. Learn more about youth violence from the CDC's video "What Is Youth Violence?"

Watch the video, and then respond to the following questions.

1. Who experiences youth violence?
2. What are two risk factors for experiencing violence?

[Access multimedia content \(<https://openstax.org/books/population-health/pages/26-3-preschool-school-age-and-adolescent-health>\)](https://openstax.org/books/population-health/pages/26-3-preschool-school-age-and-adolescent-health)

Part of the CDC's commitment to injury and violence prevention includes efforts to change social norms about youth violence. Watch its video "Voices of Change: Engage Youth, Prevent Violence" to see how the University of Louisville Youth Violence Prevention Research Center (YVPRC) engages and empowers local youth as subject experts in their own community.

Watch the video, and then respond to the following question.

1. What are two strategies taught to prevent violence?

Integration of Sociocultural and Linguistically Responsive Interventions for Preschool, School-Age, and Adolescent Health

Promoting the health and well-being of this population requires consideration of sociocultural factors, such as race, ethnicity, culture, and language. Various challenges and considerations are involved in implementing sociocultural and linguistically responsive interventions in this population. This section provides examples of successful programs that effectively integrate responsiveness into health interventions. Nurses can improve health outcomes and reduce health disparities for children and adolescents from diverse backgrounds through integrations such as these.

Caregivers who identify as BIPOC are less likely than non-Hispanic White parents to report their children receive high-quality health care. Examples of structural inequities these clients experience include racism, xenophobia, and poverty. Okoniweski et al. (2022) reported that children whose caregivers' primary language is not English face additional disparities and are less likely to have a regular source of medical care. These indications strengthen the need for sociocultural and linguistic interventions to promote better pediatric outcomes.

Sociocultural Interventions

The cigarette smoking rate among Alaska Native adults was 36 percent from 2018 to 2020 (Alaska Department of Health, 2022). This provides Alaska with a unique challenge to protect children from the harmful effects of secondhand smoke exposure. The Alaska Tobacco Prevention and Control Program (TPC) has promoted smoke-free environments through various interventions geared toward the Alaska Native population. The Alaska Tobacco Quit Line provides resources for tobacco cessation. TPC has partnered with the American Lung Association and the Alaska Tobacco Control Alliance to promote smoke-free unit housing and promote policies to prohibit the use of tobacco products on school properties (ODPHP, 2021). Additional partnerships have occurred between TPC and the Alaska Native Tribal Health Consortium to coordinate outreach efforts in rural communities, where as many as 4 in 10 adults smoke (ODPHP, 2021). Rural community health workers, who may reach citizens via boat or snowmobile, provide adults with tobacco cessation education and describe the hazards of secondhand smoke in children.

The CDC's (2023f) [Adolescent Health: What Works in Schools \(*https://openstax.org/r/whatworks*\)](https://openstax.org/r/whatworks) program is a school-based health approach to improve health behaviors and experiences, support mental health, and reduce suicidality. Children and adolescents who identify as LGBTQIA+ are particularly at risk for facing social stigma about their sexual choices or identities, which places their health at risk. Some specific interventions identified by this CDC program to help this population are establishing gender and sexuality alliances (GSA), identifying safe spaces, and implementing anti-harassment policies (CDC, 2023f).

Linguistically Responsive Interventions

The Centers for Medicare and Medicaid Services (CMS) released an updated framework to advance health equity, expand health coverage, and improve health outcomes for people covered by Medicare, Medicaid, CHIP, and the health insurance marketplaces. This framework identified the need to advance language access and health literacy and provide culturally tailored services to all groups. In particular, one priority in the CMS Framework for Health Equity 2022–2032 states, “Each person CMS serves should receive effective, understandable, and respectful care that is responsive to their preferred languages or dialects, health literacy, cultural health beliefs and practices, traditions, and other communication needs” (CMS, 2022, p. 25). The government’s dedication to being linguistically responsive can also be seen regarding child and youth behavioral health crisis care. The Substance Abuse and Mental Health Services Administration’s (SAMHSA, 2022) National Guidelines for Child and Youth Behavioral Health Crisis Care also requires incorporating linguistically responsive care as one of its core values for youth crisis care. This includes care regarding LGBTQIA+ youth who may be unable to access the mental health care they need to prevent suicide (SAMHSA, 2022).

Nurses may use several interventions to overcome language barriers with clients who do not speak English. These typically involve in-person interpreters or interpreter services via telephone. Jackson and Mixer (2017) described the difficulty Spanish-speaking caregivers of clients in acute care experienced and proposed using the UTalk app on an Apple iPad as a solution. The app’s interface design included a split-screen layout with an English statement on one side of the device (facing the nurse) and the same statement in Spanish flipped 180° on the other side of the screen (facing the Spanish-speaking client or family member). The app included many statements or closed-ended questions that could be used for basic communication such as “The interpreter has been called,” “Do you need anything to eat?” and “Are you having any pain?” Participants using the app reported facilitation of communication. They indicated that teaching the caregivers and clients how to use the app was an icebreaker and that it helped nurses develop relationships with the families (Jackson & Mixer, 2017).

26.4 Adult Health

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 26.4.1 Recognize major diseases affecting adults.
- 26.4.2 Compare health outcomes between adults.
- 26.4.3 Create evidence-based educational interventions to promote self-care for health promotion, illness prevention, and illness management of adults.
- 26.4.4 Examine major risk factors influencing the health of adults.
- 26.4.5 Identify Healthy People 2030 goals established for adults.
- 26.4.6 Describe health promotion and disease prevention actions applicable to adults.
- 26.4.7 Discuss evidence-based strategies for integrating sociocultural and linguistically responsive health promotion and disease prevention interventions in the clinical practice of adults.

The prevention of chronic diseases has become a major public health concern. Cardiovascular disease, diabetes, and cancer are leading causes of death and disability in adults globally; in the United States, one in three deaths each year occurs due to heart disease, stroke, or other cardiovascular diseases (National Center for Chronic Disease Prevention and Health Promotion, 2022c). The good news is that many of these chronic diseases are preventable through efforts that target lifestyle modification and appropriate health behaviors. Therefore, promoting and maintaining good health practices among adults is critical for preventing chronic diseases and improving quality of life. While chronic diseases are a significant concern for adults, communicable diseases also substantially threaten public health. Influenza, tuberculosis, and STIs are only some illnesses caused by infectious agents that may spread from person to person. The COVID-19 pandemic demonstrated the importance of preventing the spread of infection (National Foundation for Infectious Diseases, 2023).

This section discusses various aspects of adult health promotion and disease prevention, including healthy lifestyle habits, recommended screenings and immunizations, the impact of communicable and noncommunicable diseases on vulnerable populations, and the importance of cultural competence in addressing these health issues. By understanding and implementing these activities into their lives, adults can protect themselves and their communities while also improving their overall health and well-being.

Major Diseases Affecting Adults

In the United States, several major diseases affect adults, leading to significant mortality (see [Table 26.10](#)). These diseases cause physical limitations, significantly impact quality of life, and increase health care costs. Nurses must understand the causes, risk factors, and preventive measures associated with these diseases to help reduce their burden on the population and promote healthy living. Of these 13 diseases, 11 are noncommunicable diseases.

	Mortality		
	Cause of Death Rank	Number of Deaths	Deaths per 100,000 Population
Noncommunicable			
Diseases of heart	1	694,619	278.1
Malignant neoplasms	2	603,484	241.6
Accidents	4	215,485	86.3
Cerebrovascular disease	5	162,577	65.1
Chronic lower respiratory diseases	6	142,136	56.9
Alzheimer's disease	7	119,398	47.8
Diabetes	8	103,135	41.3
Chronic liver disease and cirrhosis	9	56,576	22.7

TABLE 26.10 Top Causes of Death for Adults in the United States, 2021 (See National Center for Health Statistics, 2021.)

	Mortality		
	Cause of Death Rank	Number of Deaths	Deaths per 100,000 Population
Nephritis, nephrotic syndrome, and nephrosis	10	54,283	21.7
Intentional self-harm (suicide)	11	45,229	18.1
Essential hypertension and hypertensive renal disease	12	42,806	17.1
Communicable			
COVID-19	3	416,252	166.7
Influenza and pneumonia	13	41,653	16.7

TABLE 26.10 Top Causes of Death for Adults in the United States, 2021 (See National Center for Health Statistics, 2021.)

Coronary Artery Disease

Coronary artery disease (CAD), also called coronary heart disease or ischemic heart disease (CDC, 2021j), occurs when plaque buildup in the wall of the coronary arteries (atherosclerosis) decreases blood supply to the heart. Risk factors for CAD include being overweight, eating poorly, and smoking tobacco. CAD also has genetic connections, particularly a family history of heart disease before age 50. For many, the first indicator of CAD is a heart attack.

Cancer

Cancer occurs when abnormal cells divide out of control and can invade other tissues (CDC, 2021f). Cancer cells can also spread to other body parts through the blood and lymph symptoms. There are more than 100 different types of cancer; some are preventable, and others are not. One of every five deaths in the United States is due to cancer (U.S. Cancer Statistics Working Group, 2022). One leading cause of cancer is smoking. In addition to lung cancer, smoking can cause cancer in the blood, bladder, cervix, colon and rectum, esophagus, kidney, larynx, liver, mouth and throat, pancreas, and stomach. Lowering one's cancer risk can occur through making healthier choices such as maintaining a healthy weight, limiting alcohol intake, and protecting the skin from UV exposure.

Cerebrovascular Disease

Cerebrovascular disease, or a stroke, is caused when something blocks the blood supply to a part of the brain or a blood vessel in the brain ruptures (CDC, 2023i). Regardless of the cause, parts of the brain become damaged or die, leading to problems with movements, memories, thoughts, emotions, language, or other body functions. Strokes can occur at any age, but some people are at greater risk. Those with a history of a previous stroke or transient ischemic attack (TIA), hypertension, high cholesterol, coronary artery disease, atrial fibrillation, diabetes, obesity, and sickle cell disease are at much higher risk of having a stroke. Some lifestyle choices that increase the risk of stroke include (CDC, 2023j):

- a diet high in saturated fats and cholesterol,
- a lack of enough physical activity,
- too much alcohol consumption, and
- tobacco use.

There are also genetic components to stroke risk and factors related to age, sex, race, and ethnicity. Individuals aged 55 and older are more likely to have a stroke, and strokes are more common in women than men. Those who are non-Hispanic Black or Pacific Islander are more likely to die from a stroke than non-Hispanic White people, Hispanic people, AIAN, and Asians. Black people have a higher risk of having a first stroke and are more likely to die from a stroke than White people (CDC, 2023j).

Chronic Obstructive Pulmonary Disease

Chronic obstructive pulmonary disease (COPD) is a group of diseases that block airflow and cause other breathing-related problems. COPD includes emphysema and chronic bronchitis. Tobacco smoking is the primary cause of COPD; other causes are related to exposure to air pollutants in the home and workplace, genetic factors, and a

history of respiratory infections. The CDC (2021h) reports that women; people aged 65 and older; AIAN and multiracial non-Hispanic people; those who are unemployed, retired, or unable to work; those with less than a high school education; those who are divorced, widowed, or separated; current or former smokers; and those with a history of asthma are more likely to develop COPD.

Alzheimer's Disease

Alzheimer's disease is the most common type of dementia. It begins with mild memory loss and then progresses to the inability to hold a conversation or respond to the environment appropriately, causing severe difficulties in performing activities of daily living (CDC, 2020d). Alzheimer's disease impacts the part of the brain that controls thoughts, memories, and language. Much remains to be learned about this disease. The best-known risk factor for developing Alzheimer's disease is age. Genetics may also play a role in its development. Findings suggest that a healthy lifestyle could decrease the risk of developing Alzheimer's disease (CDC, 2020d).

ALZHEIMER'S DISEASE—GENES DO NOT EQUAL DESTINY

In the Aging and Health Matters podcast episode “[Alzheimer's Disease—Genes Do Not Equal Destiny](https://openstax.org/r/toolscdc) (<https://openstax.org/r/toolscdc>)”, host Montrece Ransom speaks with CDC’s Scott Bowen about research that found a healthy lifestyle can help reduce the risk for Alzheimer's disease (CDC, 2022o).

Listen to the podcast or [read the transcript](https://openstax.org/r/medialibrary) (<https://openstax.org/r/medialibrary>), and then respond to the following questions.

1. What were the new findings from the research?
2. What were the four healthy lifestyles that helped to prevent dementias in the research?

Diabetes

Diabetes is a chronic health condition caused by the body either not making enough insulin or not using insulin effectively. When either of these occurs, too much blood sugar remains in the bloodstream (CDC, 2022e). Over time, the increased blood sugar can lead to serious health problems, including heart disease, vision difficulties, and kidney disease. More than one in three adults in the United States have prediabetes, with blood sugar levels higher than normal but not high enough to develop type 2 diabetes, and over 80 percent of adults do not know they have prediabetes (CDC, 2022j). Prediabetes can increase the risk of heart disease and stroke and can be viewed as an opportunity to prevent type 2 diabetes. See [Figure 26.3](#) for more about prediabetes.

The three types of diabetes are type 1 diabetes, type 2 diabetes, and gestational diabetes. Gestational diabetes was discussed briefly earlier in this chapter. In type 1 diabetes, the body does not make enough insulin, perhaps due to an immune reaction. Risk factors for this type of diabetes are family history and age, as it usually develops in children, teens, or young adults. White people in the United States are more likely to develop type 1 diabetes than Black or Hispanic people (CDC, 2022j), and there is no known way to prevent it. In type 2 diabetes, the pancreas makes less insulin than previously, and the body becomes resistant to it. Type 2 diabetes can sometimes be prevented with healthy diet and activity. A variety of factors put a person at risk for type 2 diabetes, including:

- having prediabetes;
- being overweight;
- being age 45 or older;
- having a direct relative with type 2 diabetes;
- being physically active less than three times weekly;
- having gestational diabetes or giving birth to a baby weighing over 9 pounds; and
- being African American, Hispanic, or AIAN (CDC, 2022e).

Also, more than half of women with PCOS develop type 2 diabetes by age 40, likely related to insulin resistance that occurs with PCOS (CDC, 2022w). Diabetes is the primary cause of kidney failure, lower-limb amputations, and adult blindness. The number of adults diagnosed with diabetes has more than doubled over the last 20 years. Of the adult U.S. population, 38 percent have prediabetes (CDC, 2022j).

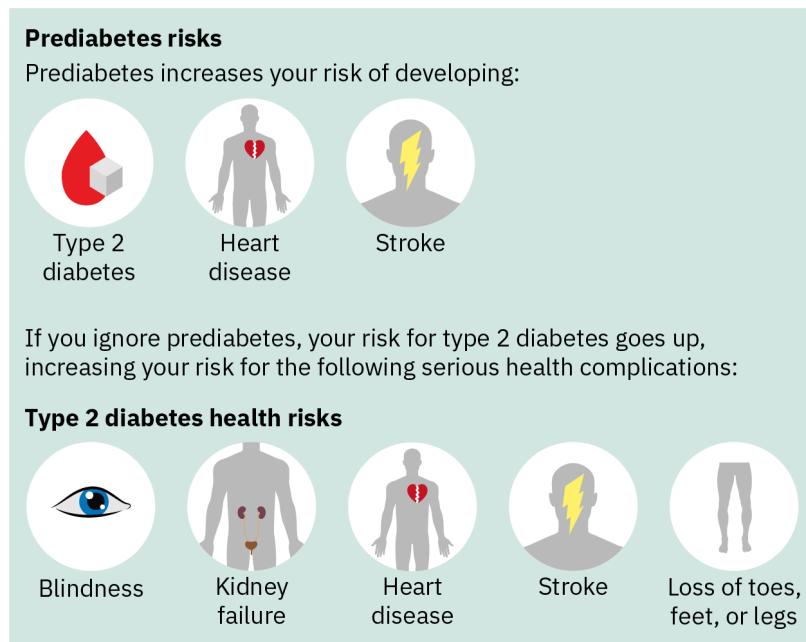

FIGURE 26.3 The Prediabetes: Could It Be You? infographic describes statistics, the definition of, risks for, and health risks of prediabetes. (See CDC, 2022e; attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

Chronic Liver Disease

Chronic liver disease is a progressive deterioration of liver function, which includes the production of clotting factors and other proteins, detoxification of harmful metabolism products, and bile excretion. Cirrhosis is the final stage of chronic liver disease. The most common causes of chronic liver disease are alcoholic liver disease, non-alcoholic fatty liver disease, chronic viral hepatitis, and certain genetic and autoimmune causes. Other causes include use of certain drugs (amiodarone, isoniazid, methotrexate, phenytoin, and nitrofurantoin) and the vascular Budd-Chiari syndrome (Sharma & Nagalli, 2022). Of the causes, it is possible to deter chronic liver disease by limiting the use of over-the-counter pain medications and consumption of high-fat foods and alcohol and reducing the risk of developing hepatitis through vaccination, safer sex practices, and good hygiene.

Chronic Kidney Disease

Chronic kidney disease involves the damage of kidneys such that they cannot filter blood to remove wastes, toxins, and excess fluid. This excess fluid and waste remain in the body, leading to heart disease and stroke. The kidneys also help control blood pressure, stimulate the production of red blood cells, keep the bones healthy, and regulate important chemicals such as sodium, potassium, and calcium (CDC, 2022c). Risk factors for chronic kidney disease include diabetes, high blood pressure, heart disease, a family history of chronic kidney disease, and obesity. Following a healthy lifestyle and addressing any of the conditions that are risk factors can help decrease the effects or prevent chronic kidney disease.

Communicable Diseases

Two of the 10 diseases in [Table 26.10](#) are communicable diseases (influenza and COVID-19). Both are respiratory in nature, with similar symptoms, and are easily transmitted (CDC, 2022p). See [Pandemics and Infectious Disease Outbreaks](#) for more information.

Comparison of Health Outcomes Between Adults

When comparing health outcomes between adults, many factors must be considered. SDOH, discussed in [Social Determinants Affecting Health Outcomes](#), including economic stability, education access and quality, health care access and quality, neighborhood and built environment, and social and community context, are only a few of these factors. Others include age, gender, race, and lifestyle behaviors.

The following key health outcomes are commonly compared in adults; see [The Health of the Population](#) for more information:

- Overall health status: An individual's self-perceived health status ranges from excellent to poor. In the United

States, in 2019, 11.2 percent of people reported fair or poor health status. Trends related to age group and economic stability can be viewed on the [CDC Health Status page \(<https://openstax.org/r/cdcnchshustopics>\)](https://openstax.org/r/cdcnchshustopics).

- **Chronic disease prevalence:** This refers to the proportion of a population with chronic disease at a point in time. Data from the 2018 National Health Interview Survey (NHIS) found that 51.8 percent of the U.S. adult population had been diagnosed with at least one of the 10 chronic conditions previously discussed, and 27.2 percent had more than one of them. Data broken down into categories of sex, race/ethnicity, age, health insurance coverage, and location of residence (urban versus rural) can be viewed at [Prevalence of Multiple Chronic Conditions Among U.S. Adults, 2018 \(<https://openstax.org/r/cdcpcd>\)](https://openstax.org/r/cdcpcd) (Boersma et al., 2020).
- **Mortality rates:** These are the number of deaths in a population, typically measured as the number of deaths per 100,000 individuals. The provisional mortality data in the United States in 2022 indicated that overall death rates were highest among males, older adults, and Black persons. In 2022, the highest weekly numbers of overall deaths and COVID-19-associated deaths were in January and December. Overall death and COVID-19-associated death data by age group, sex, and race and ethnicity can be viewed at [Provisional Mortality Data – United States, 2022 \(<https://openstax.org/r/cdcmmwr>\)](https://openstax.org/r/cdcmmwr) (Ahmad et al., 2023).
- **Quality of life:** Health-related quality of life (HRQOL) is an individual's or a group's perceived physical and mental health over time. On the individual level, HRQOL involves perceptions of physical and mental health and their correlates, including health risks and conditions, functional status, social support, and socioeconomic status. On the community level, HRQOL includes community-level resources, conditions, policies, and practices that can influence a population's functional status and perceptions of health (CDC, 2018). The [County Health Rankings \(<https://openstax.org/r/healthrankings>\)](https://openstax.org/r/healthrankings) (University of Wisconsin Population Health Institute, 2023) model of health indicates measures that influence how well and how long people live. In this model, the following measures connect to quality of life:
 - Poor or fair health
 - Poor physical health days
 - Poor mental health days
 - LBW
 - Frequent physical distress
 - Frequent mental distress
 - Diabetes prevalence
 - HIV prevalence

In 2020, 12 percent of U.S. adults reported that they considered themselves in fair or poor health, that their physical health was not good on 3 of the previous 30 days, and that their mental health was not good on 4.4 of the previous 30 days. The percentage of live births with LBW (under 2,500 grams) was 8 percent. Also, 9 percent of adults were living with a diagnosis of diabetes, and 380 of every 100,000 residents aged 13 and over were living with a diagnosis of HIV (University of Wisconsin Population Health Institute, 2023).

Educational Interventions to Promote Self-Care in Adults

The WHO (2022d, para. 2) defines self-care as “the ability of individuals, families, and communities to promote their own health, prevent disease, maintain health, and to cope with illness and disability with or without the support of a health professional.” The concept of self-care recognizes individuals as active participants in managing their health in various areas, including health promotion, disease prevention and control, self-medication, providing care to dependent persons, and rehabilitation, including palliative care. Self-care is not intended to replace the need for the formal health care system but allows a different option to receive health care.

Some examples of educational interventions that may be used to promote self-care in the adult population include:

- **Health education classes:** can provide individuals or groups with information on topics such as healthy eating, physical activity, stress management, and disease prevention. Classes can be offered in various settings, such as community centers, workplaces, or health care facilities.
- **Self-help materials:** brochures, pamphlets, and books can provide individuals with information to maintain good health and prevent illness and can be made available in waiting rooms, libraries, and other public spaces.
- **Workshops:** can focus on learning practical self-care skills, such yoga or healthy cooking; may be led by health care professionals, community leaders, or trained volunteers.
- **Mobile health applications (apps):** can provide individuals with personalized health information, reminders,

and tracking tools to help them maintain healthy habits. Apps are downloaded on smartphones and are available at any time.

- Social support groups: can provide individuals with the emotional support and encouragement needed to maintain healthy habits; can be led by trained facilitators and can meet in-person or virtually.

The WHO's [Guideline on Self-Care Interventions for Health and Well-Being \(https://openstax.org/r/ncbibooks\)](https://openstax.org/r/ncbibooks) offers suggestions for many health situations for adults. These guidelines stress the importance of tailoring these interventions to the needs and preferences of the target population to ensure maximum effectiveness (WHO, 2022d). See [Planning Community Health Education](#) for more information.

Healthy People 2030 Goals for Adults

Several Healthy People 2030 goals specifically target the health of the adult population. Healthy People 2030 divides these into goals for males and females. The overarching goal is to "improve health and well-being" (ODPHP, n.d.-d, para. 1).

The difference in the wording of the Healthy People 2030 goals for each sex is likely because males die an average of 5 years earlier than females (ODPHP, n.d.-d). According to the NCHS (2022),

Life expectancy at birth for females in the United States dropped 0.8 years from 79.9 years in 2020 to 79.1 in 2021, while life expectancy for males dropped one full year, from 74.2 years in 2020 to 73.2 in 2021. The report shows the disparity in life expectancy between males and females grew in 2021 from 5.7 years in 2020 to 5.9 years in 2021. From 2000 to 2010, this disparity had narrowed to 4.8 years, but gradually increased from 2010 to 2019 and is now the largest gap since 1996. (para. 4)

Males are also at higher risk for some serious health conditions, such as heart disease, lung cancer, and HIV (ODPHP, n.d.-d). Specific Healthy People 2030 objectives for males are related to prostate cancer (reduce the prostate cancer death rate) and sexually transmitted infections (reduce the syphilis rate in males who have sex with males and reduce gonorrhea rates in male adolescents and young males) (ODPHP, n.d.-d).

Females also have unique health issues, such as menopause, and some health issues that may affect both sexes can pose unique challenges for females (ODPHP, n.d.-i). Females are also at risk for breast cancer and cervical cancer. There are several specific Healthy People 2030 Objectives for females, including:

- Reduce iron deficiency in females aged 12 to 49 years
- Reduce the female breast cancer death rate
- Increase the proportion of females who get screened for breast cancer
- Increase the proportion of females who get screened for cervical cancer
- Increase the proportion of females at increased risk who get genetic counseling for breast and/or ovarian cancer
- Reduce infections cause by *Listeria*
- Reduce the proportion of adults with osteoporosis
- Reduce pelvic inflammatory disease in female adolescents and young females
- Increase the proportion of sexually active female adolescents and young females who get screened for chlamydia
- Reduce the syphilis rate in females

Other goals target adult health, even though Healthy People 2030 does not specifically group these into such a category. [Table 26.11](#) provides some examples.

Category	Example of Healthy People 2030 Objective
Physical activity	Increase the proportion of adults who meet the guidelines for aerobic physical activity and muscle-strengthening activity from 25.2% in 2020 to 29.7% in 2030.
Nutrition and healthy eating	Reduce the proportion of adults with obesity from 41.8% between 2017 and 2020 to 36% in 2030.
Tobacco use	Reduce current tobacco use in adults from 19.3% in 2021 to 17.4% in 2030.

TABLE 26.11 Examples of Healthy People 2030 Objectives Related to Adult Health (See ODPHP, n.d.-d, n.d.-i.)

Category	Example of Healthy People 2030 Objective
Drug and alcohol use	Reduce the proportion of people who had alcohol use disorder in the past year from 5.3% in 2019 to 3.9% in 2030.
Mental health	Reduce the suicide rate from 14.2 suicides per 100,000 population in 2018 to 12.8 per 100,000 population in 2030.
Chronic diseases	Reduce the number of diabetes cases diagnosed yearly from 5.5 new cases of diabetes per 1,000 adults in 2019–2021 to 4.8 per 1,000 adults in 2030.

TABLE 26.11 Examples of Healthy People 2030 Objectives Related to Adult Health (See ODPHP, n.d.-d, n.d.-i.)

These Healthy People 2030 goals and objectives reflect the importance of promoting healthy behaviors, preventing chronic diseases, and improving mental health in adults. This can be achieved by addressing some of the SDOH, mentioned previously in this chapter and in [Social Determinants Affecting Health Outcomes](#). For instance, increasing access to healthy, safe, and affordable food can improve the nutrition and health of adults ([Figure 26.4](#)). There are a variety of factors contributing to access of such foods (ODPHP, n.d.-e):

- Availability: The location, number, variety, and quality of grocery stores, food services, and farmers markets affects the availability of healthy foods in the community.
- Cost: The cost of foods affects which items adults purchase. The availability of produce and other healthier items can be limited, and they are often more expensive at convenience stores or smaller markets.
- Transportation: Access to reliable transportation can make it easier to travel for food and gives adults more choice in where they obtain food. Less access to reliable transportation can be a challenge for those living in rural communities.
- Community Programs: Local participation in community food support programs, such as farmers markets that accept payment using Supplemental Nutrition Assistance Program (SNAP) benefits, can encourage healthier food choices.

FIGURE 26.4 A USDA farmers market provides a sample of what \$10 of SNAP benefits might purchase. (credit: Lance Cheung/USDA/Flickr, Public Domain)

Health Promotion and Disease Prevention Activities to Improve the Health of Adults

Many health promotion activities for adults focus on addressing the short list of risk behaviors that lead to chronic illness; these include tobacco use, poor nutrition, physical inactivity, and excessive alcohol use. By engaging in health promotion activities, adults can improve their health, reduce their risk of chronic diseases, and create supportive environments that make healthy choices easier and more accessible. Mitigation of 7 of the 10 diseases

shown in [Table 26.10](#) can occur by addressing these behaviors. The CDC's National Center for Chronic Disease Prevention and Health Promotion (2022c) provides detailed approaches to address these behaviors, including:

- helping people who smoke quit,
- increasing access to healthy foods and physical activity,
- preventing excessive alcohol use,
- promoting lifestyle change and disease management,
- promoting community water fluoridation,
- promoting mental health and emotional well-being, and
- promoting better sleep.

Public health policies and programs can also play a critical role in promoting health and improving the overall well-being of adults. Many success stories have resulted from health promotion activities to address the risk behaviors connected to the United States' common chronic illnesses:

- [Healthy Foods in Alabama Corner Stores Help Fight Food Deserts \(<https://openstax.org/r/nccdsuccessstories>\)](#)
- [Coeur d'Alene Tribe Gets More Native Americans Moving with Pow Wow Sweat \(<https://openstax.org/r/cdcnccdsuccessstories>\)](#)
- [Tiffany R.'s Story: Tips from Former Smokers® \(<https://openstax.org/r/tobaccotips>\)](#)
- [Check Your Drinking. Make a Plan to Drink Less \(<https://openstax.org/r/checkyourdrinking>\)](#)
- [Beth's Experience as a Breathe Well, Live Well Educator \(<https://openstax.org/r/experience>\)](#)
- [How Right Now \(<https://openstax.org/r/howrightnow>\)](#)

Adulthood comes with many responsibilities and increased productivity. From the ages of 18 through 65 years, significant biological, physiological, social, and psychological changes occur (Mayo Clinic, 2023). During this time, adults develop relationships with significant others, marriages or partnerships, families, and careers while making lifelong decisions. All of this impacts the health of adults.

Nurses are integral to fostering health promotion and disease prevention in U.S. adults. Along with individual, client-centered care, the nurse may need to provide family-centered and workplace health promotion and disease prevention to best address the health of this population. Nurses often conduct health assessments to identify risk factors and develop individualized, family, and population plans. This may include assessing lifestyle factors or screening for chronic diseases. Nurses provide education to individual and adult populations on healthy lifestyle behaviors, disease prevention, and self-care management. Nurses perform preventative measures to detect and prevent diseases, such as administering immunizations, performing screenings, and providing counseling. Nurses coordinate care for adults with complex health needs through referrals to appropriate health care providers, community resources, or social services to assist in meeting their needs. Finally, nurses advocate for the adult population by promoting policies and environments that support health and prevent disease, such as working to address SDOH that contribute to health disparities (Mesariri et al., 2022).

Primary Prevention

Primary prevention involves taking measures to prevent health problems or injuries before they happen. A variety of primary prevention strategies can be used in the adult population. Some of these include:

- Immunizations: Immunizations are a highly effective mechanism of preventing infectious diseases such as influenza, pneumonia, COVID-19, and hepatitis B. The HPV vaccine can prevent several different types of cancer (CDC, 2023e). See the [CDC's 2023 Recommended Adult Immunization Schedule \(<https://openstax.org/r/cdcadult>\)](#) for specific recommendations for adults (CDC, 2023a).
- Health education: Education can alter behaviors that could lead to disease or injury and can increase resistance to disease or injury should exposure occur. Some examples of health education for the adult population include nutrition, regular exercise, avoidance of smoking, workplace safety, safe sex practices, and sun safety ([Figure 26.5](#)).
- Advocacy: Nurses can advocate for legislation and enforcement to ban or control the use of hazardous products, such as asbestos, or to mandate safe and healthy practices, such as the use of seat belts.

Averting musculoskeletal disorders such as lower back pain, neck and shoulder pain, wrist strain, and tendonitis is one example of primary prevention. These disorders are among the leading causes of work-related disability

associated with prescription opioid use that can progress into substance use disorder (Le & Rosen, 2021). Primary prevention can address musculoskeletal disorders and implement proper ergonomics in the workplace. For example, nurses can educate workers to lift with their arm and leg muscles rather than their back. Implementing a work site stretch and flex program can prepare the employee's body for the shift ahead (ResponsAble Safety Staffing, 2018). Personal protective equipment (PPE) designed to reduce the risk of injury, such as shoulder and knee pads, can prevent injury. These strategies can prevent the progression to a substance use disorder and reduce workers' compensation, health care, social security, and other disability costs associated with work-related injuries (Le & Rosen, 2021). [Caring Across Practice Settings](#) discusses occupational health in more detail.

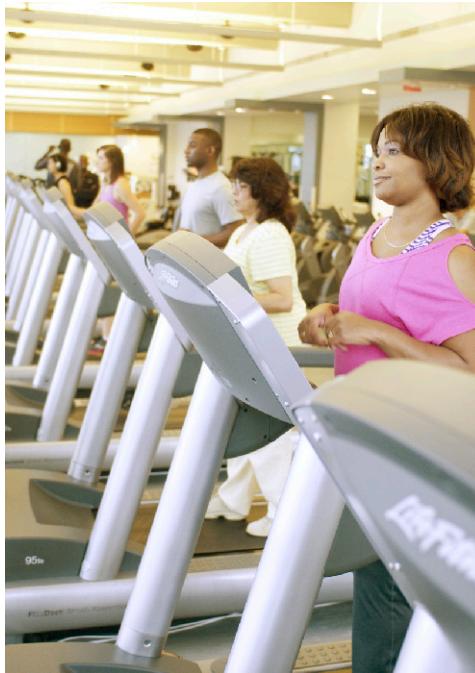

FIGURE 26.5 This image illustrates an employee fitness center where a number of activities are provided for employees' health, including treadmills for aerobic exercise. (credit: Amanda Mills/CDC, Public Domain)

Secondary Prevention

Secondary prevention is critical for detecting and treating diseases, before they cause significant harm. Screening tests, diagnostic tests, and routine health exams are essential for early detection and treatment of diseases. The [2023 Adult Preventive Health Guidelines: Ages 19 through 64 Years](#) (<https://openstax.org/r/highmarkprc>) provides specific information (Highmark, 2023a). Examples of secondary prevention strategies for adults include:

- Cancer screening: Screenings for cancer, such as mammograms, colonoscopies, and Pap tests, can detect cancers at its earliest stages, when treatment is most effective.
- Cardiovascular disease screenings: Regular blood pressure and cholesterol screenings can detect early signs of cardiovascular disease, allowing for early intervention and treatment.
- Diabetes screenings: Screening for diabetes with a simple blood test can detect the disease or prediabetes early, allowing for early intervention and treatment to prevent progression and complications.
- Routine health exams: Regular checkups with a health care provider can help identify health problems before they become serious.
- Skin cancer screenings: Routine skin cancer screenings can detect early signs of skin cancer.
- STI screenings: Regular STI screenings can detect early signs of infection, allowing for early treatment, prevention of spread, and prevention of complications
- Osteoporosis screenings: Regular bone density screenings can detect early signs of osteoporosis, allowing for early intervention and treatment to prevent fractures.

The HPV test, which looks for the virus that can cause cell changes on the cervix, and the Pap test, which looks for precancers or cell changes on the cervix that, if untreated, might become cervical cancer, are the two tests that can help either prevent cervical cancer or find it early in adult women. [Jasmine's Story: Preventing Cervical Cancer](#)

(<https://openstax.org/r/swxzftsfsta>) provides one person's experience with this screening.

The CDC has also developed an interactive experience, called [Talk to Nathan \(<https://openstax.org/r/cdccancer>\)](https://openstax.org/r/cdccancer), that provides a conversation with an avatar to help clients determine if they should be screened for prostate cancer. Another interactive experience is provided to health care providers to allow them to practice helping clients make decisions about prostate cancer screening and treatment (CDC, 2022m).

Tertiary Prevention

Tertiary prevention focuses on preventing further complications and improving the quality of life for adults who are living with a chronic disease or condition. Some examples of tertiary prevention strategies for adults include:

- Disease management programs: Disease management or disease self-management programs are designed to help adults with chronic diseases manage their condition and prevent progression or complications. They may include education, lifestyle changes, medication management, and support groups.
- Rehabilitation programs: Rehabilitation programs, such as physical therapy and occupational therapy, can help adults regain strength and function following an illness or injury.
- Chronic pain management: Chronic pain management programs can help adults manage their pain and improve their quality of life. These may include medication management, therapies, and psychological support.
- Palliative care: Palliative care is specialized medical care for those living with a serious illness, such as cancer or heart failure. It is meant to provide symptom care to allow them to focus on their quality of life. Palliative care can be provided along with curative treatment (National Institute on Aging, 2021).
- End-of-life care: End-of-life care is often also known as hospice care. It focuses on the care, comfort, and quality of life of a person with a serious illness who is approaching the end of life. Attempts to cure a person's illness are no longer used (National Institute on Aging, 2021).
- Mental health support: Mental health support may include therapy and support groups to assist adults and their families in coping with emotional and psychological effects of diseases.

The CDC's National Diabetes Prevention Program was created in 2010 to address the increasing burden of prediabetes and type 2 diabetes on adults in the United States. Partnerships between public and private organizations led to the development of evidence-based, cost-effective interventions to help prevent type 2 diabetes in communities. The [Lifestyle Change Program \(<https://openstax.org/r/cdcdiabetes>\)](https://openstax.org/r/cdcdiabetes) is one result of this effort. It is designed for adults who are overweight, not yet diagnosed with type 1 or type 2 diabetes, and not currently pregnant but either are diagnosed with prediabetes, were previously diagnosed with gestational diabetes, or have high-risk results on the CDC's prediabetes risk test. The program involves a CDC-approved curriculum, a lifestyle coach, and a support group of people with similar goals and challenges (CDC, 2022u).

Integration of Sociocultural and Linguistically Responsive Interventions for Adults

A "one size fits all" approach to health promotion and disease prevention may not be effective for all clients. Sociocultural and linguistic factors such as language barriers, cultural beliefs, and SDOH can significantly influence an individual's health outcomes. Therefore, integrating sociocultural and linguistically responsive interventions into health care is crucial for promoting health equity and improving health outcomes for all individuals, including adults. This section explores the importance of integrating sociocultural and linguistically responsive interventions for adults and some examples of how nurses can effectively implement these interventions into practice.

Sociocultural Interventions

By incorporating socioculturally responsive components into the design of health promotion and disease prevention programs, nursing interventions can more effectively engage and promote healthy behaviors among the adult population. Immigrant adults are one specific population that may benefit from such integration. Immigrants face unique cultural barriers to participation in mainstream health promotion programs. These include a lack of access to health care for a variety of reasons, including ineligibility for certain programs, limited support for culturally appropriate health care services, lack of knowledge of the U.S. health care system, distrust of the U.S. health care system, and fears related to deportation with the use of public services (Ali et al., 2021). Other barriers may involve specific customs and unique cultural or religious understandings of health and disease. U.S. immigrants are more likely to be unaware of a chronic disease, such as hypertension, and have lower treatment rates. Ali et al. (2021) determined that while modifiable lifestyle behavioral risk factors must be the common target for hypertension

reduction interventions, additional factors should be considered in immigrant communities. These factors include:

- gender roles,
- perceptions about physical activity,
- demanding work schedules,
- neighborhood barriers to healthy living, and
- limited physical and financial accessibility to appropriate spaces for healthy activities.

For example, Oshunluyi et al. (2020) described group-based culturally adapted educational sessions on hypertension for African immigrants that incorporated culturally appropriate storytelling. Ma et al. (2020) described using local libraries, churches, and homes to provide group-based culturally adapted education sessions to Filipino Americans at risk of hypertension. Family members have been shown to have a very strong role in impacting sociocultural and economic factors related to immigrant health and behavior change (Ali et al., 2021). Therefore, family members have been successful as change agents in this population.

Linguistically Responsive Interventions

While sociocultural responsiveness as a whole is imperative in the design of health promotion and disease prevention programs for adults, there is a specific need for linguistic responsive interventions. Kling et al. (2018) described using open, multipurpose rooms inside park recreation centers for group-based multilingual fitness classes. In the classes, five instructors were Hispanic, and four were non-Hispanic Black. Six instructors led the class in English, one led in Spanish, and one led in a mixture of English and Spanish.

26.5 Older Adult Health

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 26.5.1 Recognize major diseases affecting older adults.
- 26.5.2 Examine major risk factors influencing the health of older adults.
- 26.5.3 Create educational interventions to promote self-care for health promotion, illness prevention, and illness management of older adults.
- 26.5.4 Identify Healthy People 2030 goals established for older adults.
- 26.5.5 Describe health promotion and disease prevention actions designed to improve the health of older adults.
- 26.5.6 Discuss strategies for integrating sociocultural and linguistically responsive health promotion and disease prevention interventions in clinical practice of older adults.

Thanks to advances in technology, improvements in health care services, interventions in public health, and research on the utilization of health services, people are living longer and healthier lives. Much improvement lies in reducing infectious diseases, which were major killers at the turn of the 20th century. U.S. life expectancy increased from 48.3 years for women and 46.3 years for men in 1900 to 79.3 years and 74.1 years, respectively, in 2000. In 2019, Americans' life expectancy at birth was 81.4 years for women and 76.3 years for men (NCHS, 2023a). Since 2020, however, drops in life expectancy have occurred in the United States. In 2020, life expectancy at birth for women was 79.9 years and dropped further to 79.1 years in 2021. In 2020, life expectancy at birth for men was 74.2 years and dropped to 73.2 years in 2021 (NCHS, 2022b). These declines are largely due to the COVID-19 pandemic and drug overdose (NCHS, 2022b). Despite this decrease, the country will see continued growth in the older adult population, comprising those aged 65 and over. In 2030, the projected population will be more than twice as large as it was in 2000, growing from 35 million to 73 million and representing 21 percent of the total U.S. population (Federal Interagency Forum on Aging-Related Statistics, 2020). Also of note, nearly one in four older adults in 2019 were members of racial or ethnic minority populations (Administration on Aging, 2021).

As this group lives longer, society must meet their needs. The NCHS (2023d) reported that in 2021, 22.6 percent of noninstitutionalized persons aged 65 and over were in fair or poor health. In 2019, 16.6 percent of people aged 65 and over had one or more hospital stays. According to the American Health Care Association and the National Center for Assisted Living (AHCA/NCAL, 2023), more than 800,000 Americans reside in assisted living communities. The Administration on Aging (2021) indicated that in 2019, only 1.2 million persons (1 percent of persons aged 65–74, 2 percent aged 75–84, and 8 percent aged 85 and over) lived in nursing homes. In 2022, 20.5 percent of men and 26.7 percent of women aged 65 to 74 lived alone, and 23.8 percent of men and 42.5 percent of women

aged 75 and over lived alone (U.S. Census Bureau, 2022). Mechanisms of providing health insurance, supportive environments, healthy communities, and social safety nets, including health care provision, must be in place. Health promotion and disease prevention are essential parts of maintaining the older adult population's health and well-being. Older adults must stay informed about healthy lifestyle choices and work with nurses and other health care professionals to create personalized plans for maintaining good health ([Figure 26.6](#)).

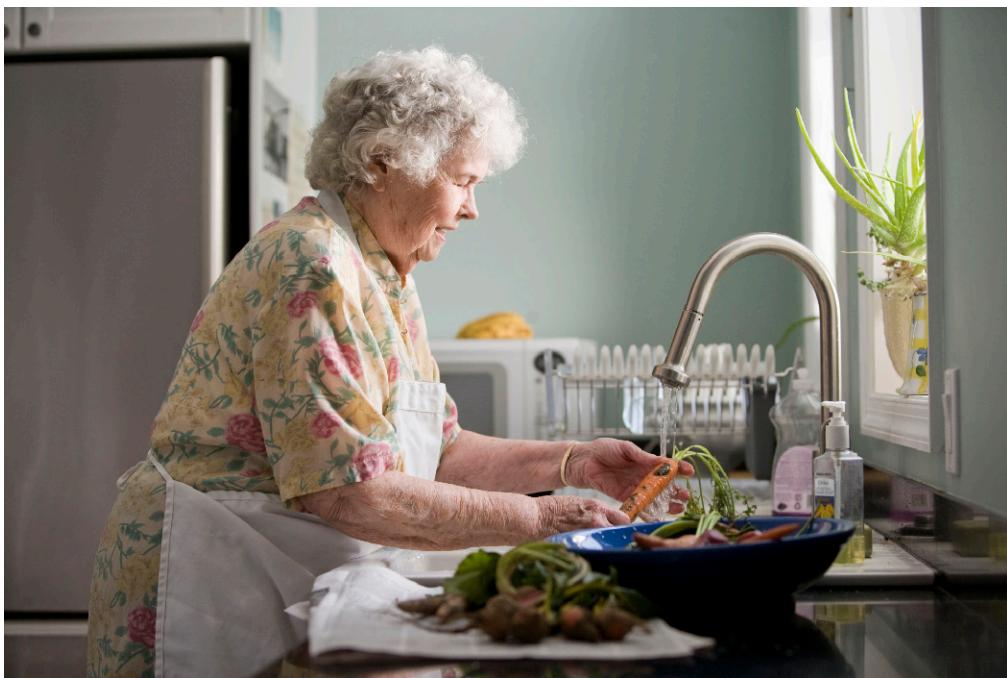

FIGURE 26.6 Proper cleaning of fresh, uncooked produce is important when preparing a meal. The client in this photo is thoroughly cleaning carrots and radishes to prevent foodborne illness. (credit: Cade Martin/CDC, Public Domain)

Major Diseases Affecting Older Adults

A variety of diseases affect older adults.

- Heart disease, cancer, and COVID-19 were the leading causes of death among persons ages 65 and over in the United States in 2021.
- Obesity remains an issue for this population.
 - 41.9 percent of noninstitutionalized men aged 65 to 74 in 2015–2018
 - 31.8 percent of noninstitutionalized men aged 75 and over in 2015–2018
 - 45.9 percent of noninstitutionalized women aged 65 to 74 in 2015–2018
 - 36.1 percent of noninstitutionalized women aged 75 and over in 2015–2018
- Hypertension is an even larger issue.
 - 66.7 percent of men aged 65 to 74 in 2015–2018
 - 81.5 percent of men aged 75 and over in 2015–2018
 - 74.3 percent of women aged 65 to 74 in 2015–2018
 - 86 percent of women aged 75 and older in 2015–2018 (NCHS, 2023d)

In 2019, leading chronic conditions for noninstitutionalized older adults included (Administration on Aging, 2021):

- arthritis (48 percent);
- physician-diagnosed and undiagnosed diabetes (29 percent in 2015–2018);
- any cancer (25 percent);
- coronary heart disease (14 percent);
- COPD, emphysema, or chronic bronchitis (10 percent);
- myocardial infarction (9 percent);
- stroke (9 percent in 2017–2018); and
- angina (4 percent).

According to the Federal Interagency Forum on Aging-Related Statistics (2020), in 2015, 7.4 percent of older adult men and 7.5 percent of older adult women not living in nursing homes had dementia.

Arthritis affects about one in every four adults in the United States. Its prevalence increases with age, and it is more common in women than in men, more common among adults with fair/poor health compared to those with excellent/very good health, and less common among adults who meet physical activity recommendations compared to those who are insufficiently active or inactive (CDC, 2021l). The prevalence of this disease is expected to increase, with projections indicating that an estimated 78.4 million adults will have been diagnosed with arthritis by 2040 (Figure 26.7) (CDC, 2021l). U.S. adults with arthritis are more likely to be obese or have diabetes or heart disease than those who do not have arthritis. For instance, 28.8 percent of adults who had arthritis in 2016–2018 were also obese, 47 percent of adults who had arthritis in 2013–2015 also had diabetes, and 49 percent of adults who had arthritis in 2013–2015 also had heart disease (CDC, 2022k).

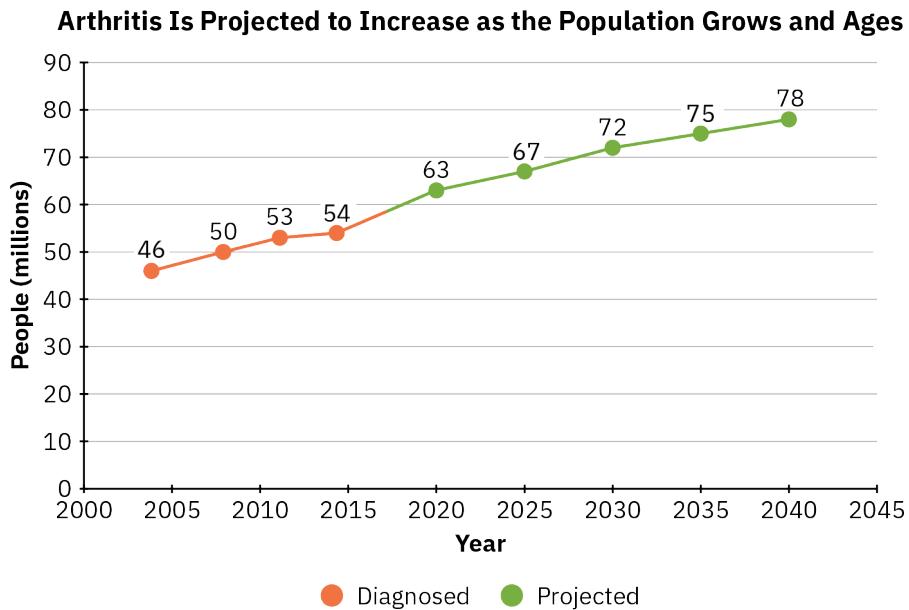

FIGURE 26.7 Estimated and projected number of adults with diagnosed arthritis in the United States. (data source: CDC, 2021l; attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license).

While coronary heart disease and stroke were common in the adult population, diseases of the heart and circulatory vessels are also prevalent in the growing population of older adults. As people age, managing these diseases becomes more difficult for older adults with comorbidities related to cognition, sleep, physical balance, and strength factors (CDC, 2019a). Myocardial infarction, or a heart attack, occurs when the flow of oxygen-rich blood to a section of heart muscle becomes blocked, leading to a lack of oxygen, which may damage the heart muscle. Angina, a symptom of CAD, is chest pain or discomfort resulting from an area of heart muscle becoming starved of oxygen-rich blood (CDC, 2019a). The prevalence of coronary heart disease in 2019 was 11.4 percent of White people, 10 percent of Black people, 8.8 percent of Hispanic people, and 6.3 percent of Asians and Pacific Islanders. Prevalence was 16.5 percent for those with no high school diploma and 10.9 percent for those with some college or more.

Risk Factors Influencing the Health of Older Adults

The Federal Interagency Forum on Aging-Related Statistics (2020) considers the following six indicators as health behavior risks: lack of vaccinations, lack of colorectal cancer screenings, poor diet, physical inactivity, obesity, and cigarette smoking. In 2018, about 69 percent of older adults reported receiving an influenza vaccine in the past 12 months. This included 72 percent of non-Hispanic White people compared with only 60.4 percent of non-Hispanic Black people and 63 percent of Hispanic people. The percentage of people aged 50 to 75 who received colorectal cancer screenings increased over the last 8 years. Older adults completing the Healthy Eating Index—2015 had their highest component scores in Whole Fruits, Total Protein Foods, and Seafood and Plant Proteins. Their overall diet quality was 64 out of 100. In 2018, only 14 percent of older adults participated in leisure-time physical activity that met the Physical Activity Guidelines for Americans. The percentage of older adults with obesity increased from 22 percent in 1988–1994 to 30 percent in 2003–2006 and 40 percent in 2015–2018. Finally, the percentage of older

adults who were current cigarette smokers has declined, as in 2018, 10 percent of older adult men and 7 percent of older adult women were current smokers (Federal Interagency Forum on Aging-Related Statistics, 2020).

Polypharmacy, the use of five or more medications, is another risk factor that impacts the health of older adults (WHO, 2019). As the population ages, people are more likely to experience comorbidities that require multiple medications. Older adults are at risk for adverse drug events (ADE) and drug interactions between these multiple medications. The most common ADE in older adults is impaired mobility, which can lead to falls, injuries, or death. Older adults are especially vulnerable due to age-related physiologic changes resulting from the absorption, distribution, metabolism, and elimination of drugs. Polypharmacy, in addition to frailty or any other condition that impacts mobility, markedly increases the risk of mortality (Parulekar & Rogers, 2018).

Sensory loss issues are another important risk factor for older adults. Hearing, vision, and touch can affect one's enjoyment of activities and ability to communicate and stay involved with others (MedlinePlus, 2022). Sensory loss issues can also put the older adult at risk for falls, which can lead to injuries or death. Age-related changes in the ear can lead to balance difficulties. Reduced vision may also lead to injuries, and perception related to touch may be impaired, causing difficulties walking related to a reduced ability to perceive where the body is in relation to the floor (Medline Plus, 2022). Other difficulties related to touch include a reduced ability to detect pressure, which can lead to pressure ulcers, and a reduced sensitivity to pain, including temperature, which could lead to burns.

A fall risk assessment may benefit older adults in the population health setting. The assessment typically includes an initial screening with questions about overall health, history of previous falls, and current issues with balance, standing, and/or walking. It should also include a set of tasks or fall assessment tools to test the older adult's strength, balance, and gait (MedlinePlus, 2021). One common approach to fall assessment is the use of the CDC's (2021) Stopping Elderly Accidents, Deaths, and Injuries (STEADI) approach. STEADI provides screening, assessment, and intervention guidelines. Particular assessments included in STEADI are:

- Timed Up-and-Go (Tug) test to assess gait,
- 30-Second Chair Stand test to assess strength and balance, and
- 4-Stage Balance test to assess balance.

[STEADI Resource Algorithm \(<https://openstax.org/r/steadi>\)](https://openstax.org/r/steadi) assessment results illustrate the degree to which an older adult is at risk of falling and may indicate areas (gait, strength, and/or balance) to address.

Ageism, discrimination against older people because of negative and inaccurate stereotyping, is a risk factor for the mental health of older adults (Weir, 2023). It is so deeply rooted in American societies that it is largely ignored. The negative effects of ageism on older adults' physical and mental well-being include:

- earlier death;
- poorer physical health, affecting sexual/reproductive health and the ability to recover from disability;
- increased risky health behaviors;
- poorer mental health, including the onset of depression, increases in depressive symptoms over time, and lifetime depression; and
- lower quality of life, social isolation, and loneliness (WHO, 2023a).

Educational Interventions to Promote Self-Care in Older Adults

Self-care is crucial for the well-being of older adults. Aging-related physical and cognitive changes can make it more difficult to take care of oneself. However, practicing self-care can help older adults maintain their independence, prevent or manage health problems, and improve their overall quality of life (Marques et al., 2019). Exercise, healthy eating, and proper medication management can help older adults maintain their physical health. Regular physical activity can help prevent chronic diseases, while a healthy diet can provide the nutrients needed to support overall health. Meditation, socializing, and hobbies can promote mental well-being and reduce the risk of depression and anxiety. Participating in social activities or volunteering can increase social engagement and reduce feelings of isolation or loneliness. Older adults who practice self-care may experience less stress and greater emotional resilience. Self-care practices such as getting enough sleep and managing chronic health conditions can improve cognitive function in older adults. These can help prevent or delay the onset of cognitive decline and dementia. Finally, self-care promotes independence for older adults. By taking care of themselves, they can maintain their independence and avoid relying on others for assistance with daily activities.

As with other age groups, health education classes can cover various topics useful for self-care of older adults, including nutrition, exercise, medication management, and stress management. Older adults can also benefit from one-on-one counseling sessions focusing on their self-care needs and goals. During such sessions, a nurse can provide guidance and support on healthy habits, medication adherence, and chronic disease management. Group support programs may also be beneficial, as they provide a sense of community and encouragement. The group may focus on a specific condition or a specific health behavior. Technology-based educational interventions may also be beneficial with older adult populations. Applications used on smartphones or websites may provide information on healthy living or assist in tracking of activities such as sleep or medication management. Finally, nurses may make home visits to older adults to provide education and support regarding self-care practices. This may be particularly useful for those who have limited mobility or live in rural areas.

Healthy People 2030 Goals for Older Adults

The overarching Healthy People 2030 goal for older adults is to “improve health and well-being for older adults” (ODPHP, n.d.-f, para. 1). Their prediction is that by 2060, almost a quarter of the U.S. population will be older adults. As such, the focus is on the issues this population experiences related to their health and SDOH.

HEALTHY PEOPLE 2030

Older Adults

Healthy People 2030 [older adult objectives](https://openstax.org/r/olderadults) (<https://openstax.org/r/olderadults>) are in a variety of categories and address topics such as physical activity, dementias, foodborne illness, infectious diseases, reduction of hospital admissions (for pressure ulcers, diabetes, urinary tract infections, pneumonia, and asthma), injury prevention related to falls or the use of inappropriate medications, oral conditions, osteoporosis, and age-related macular degeneration vision loss.

One focus area of Healthy People 2030 is falls in older adults. One in three fall annually, and falls are a leading cause of injury for this population. ODPHP (n.d.-h) has recognized that physical activity can help older adults prevent chronic diseases and fall-related injuries. Objectives related to increasing the proportion of older adults with physical or cognitive health problems who get physical activity, reducing the proportion of older adults who use inappropriate medications, reducing hip fractures among older adults, and increasing the proportion of older adults who get screened for osteoporosis can help to address falls. Unfortunately, fall-related deaths among older adults is getting worse. In 2018, there were 64.4 deaths per 100,000 caused by unintentional falls and 78 deaths per 100,000 in 2021. The target is a decrease to 63.4 per 100,000 (ODPHP, n.d.-h).

Health Promotion and Disease Prevention Activities to Improve the Health of Older Adults

Health promotion for older adults often requires a multidisciplinary approach that includes nurses, other health care professionals, community organizations, and caregivers. Health promotion activities to improve the health of older adults should be geared toward the major diseases that impact them. Regular physical activity can help older adults maintain a healthy weight, increase their strength and flexibility, reduce their risk of falls, and improve their overall health and well-being. Activities promoting a balanced and healthy diet can help with healthy weight maintenance, reduce the risk of chronic diseases, and improve overall health. Other health promotion activities that can improve the health of older adults include:

- Promoting clients to remain active, independent, and involved in their communities as long as possible
- Providing resources to help caregivers of older adults stay healthy and deliver quality care
- Providing resources for senior centers in communities
- Promoting fall prevention programs in the home and in the community
- Promoting maintenance of appointments with providers for medical management of chronic conditions

One example of a national health promotion activity is [SilverSneakers](https://openstax.org/r/silversneakers) (<https://openstax.org/r/silversneakers>) (Tivity Health, 2023). This fitness program is available for older adults enrolled in Medicare Advantage Plans (Part C) at over 17,000 locations, including national gym franchises, community centers, and senior centers. SilverSneakers also offers online workout videos for those who prefer to work out at home or are homebound. Classes range from balance and stability lessons and gentle stretches to Pilates, cardio and strength, line dancing, and kickboxing.

Yoga, mindfulness, meditation sessions, and a fitness application for smartphone use are also offered. Daily tips on the SilverSneakers blog provide information on nutrition, diseases and conditions, and physical activity tips.

Caregivers who assist older adults are essential members of public health care. While some caregivers are hired, informal or unpaid caregivers provide a substantial portion of long-term care in homes across the United States. These unpaid family members or friends are typically middle-aged or older adults who may perform a range of tasks, such as assisting with activities of daily living, helping to manage a chronic disease or disability, paying bills, shopping, providing transportation, or providing emotional support. Caregivers may initially have few responsibilities, but as the recipient's care needs increase, additional responsibilities may increase, leading to a strain on the caregiver.

The need for caregivers is an important public health issue. In 2019, the CDC indicated that there were seven potential family caregivers per older adult, but by 2030, there will only be four potential family caregivers per older adult. According to the CDC (2019b), 22.3 percent of adults reported providing care or assistance to a friend or family member in the past 30 days. Among adults aged 45 to 64 years, 24.4 percent were caregivers, compared to 18.8 percent of adults aged 65 years and over. One in four (25.4 percent) women were caregivers, compared to one in five (18.9 percent) men. Black people comprised the largest percentage of caregivers (24.3 percent), followed closely by White people (23.1 percent), then 17.9 percent of Hispanic people and 10.2 percent of Asians/Pacific Islanders. One in three caregivers provided 20 or more hours per week of care, and over half provided care or assistance for 2 years or longer.

Caregiving can provide great satisfaction and strengthen relationships between families and friends. It can also negatively affect the caregiver's ability to work, engage in social interactions and relationships, and maintain good physical and mental health (CDC, 2019b). Therefore, health promotion and disease prevention of older adults must be geared to the recipient of care and the caregiver. The CDC (2019b) recommends the following for health care professionals engaging in health promotion and disease prevention of the older adult population:

- Increase messaging regarding the importance of caregivers and of maintaining their health and well-being
- Educate about the importance of caregiving before caregivers begin
- Provide caregivers with resources and supports
- Be mindful of the health risks for caregivers, encourage them to use available information and tools, and make referrals to supportive programs and services as applicable
- Assist with caregiver training and support programs
- Advocate for awareness of and access to evidence-based programs and services that can help caregivers and care recipients
- Encourage caregivers to get regular checkups, use preventive services, and engage in self-care to maintain their physical and mental health
- Ensure that caregivers with a disability and/or chronic disease have access to self-management programs to maintain their health (para. 13)

Along with providing education and support for caregivers, population health nurses must be aware of potential elder abuse. **Elder abuse** is an intentional act or failure to act that causes or creates a risk of harm to an older adult and occurs in about 1 in 10 people aged 60 and older who live at home (CDC, 2021g). The abuse occurs at the hands of a caregiver or a person the elder trusts, and it can involve physical, sexual, emotional or psychological, or financial abuse; neglect; or a combination of these (see [Table 26.12](#)). Prevention of elder abuse can begin by understanding and addressing the factors that put them at risk for or protect them from violence. See [Caring for Families](#) for more information on preventing elder abuse.

Risk Factors for Perpetration of Elder Abuse

Individual Risk Factors	<ul style="list-style-type: none"> • Current diagnosis of mental illness • Current or past misuse of drugs or alcohol • Current physical health problem • Past experience of disruptive behavior • Past experience of traumatic events • High levels of stress • Poor or inadequate preparation or training for caregiving responsibilities • Inadequate coping skills • Exposure to or witnessing abuse as a child • Social isolation
Relationship Risk Factors	<ul style="list-style-type: none"> • High financial and emotional dependence on a vulnerable elder • Past family conflict • Inability to establish or maintain positive prosocial relationships • Lack of social support
Societal Risk Factors	<p>Specific characteristics of institutional settings, such as nursing homes and residential facilities, including:</p> <ul style="list-style-type: none"> • Staffing problems and lack of qualified staff • Staff burnout and stressful working conditions

Protective Factors for Victimization

Individual Protective Factors	<ul style="list-style-type: none"> • Emotional intelligence
Relationship Protective Factors	<ul style="list-style-type: none"> • Having social support
Community Protective Factors	<ul style="list-style-type: none"> • Sense of community, meaning, residents feeling connected to each other and being involved in the community

Mechanisms Nurses Can Use to Prevent Elder Abuse

- Listen to older adults and their caregivers to understand their challenges and provide support.
- Report abuse or suspected abuse to local adult protective services, long-term care ombudsmen, or the police. Use the [National Center on Elder Abuse \(<https://openstax.org/r/ncea>\)](https://openstax.org/r/ncea) to find your state's reporting numbers, government agencies, state laws, and other resources.
- Educate about how to recognize and report elder abuse.
- Educate on how the signs of elder abuse differ from the normal aging process.
- Check in on older adults who may have few friends and family members.
- Provide overburdened caregivers with support options.

TABLE 26.12 Elder Abuse (See CDC, 2020b; 2021g.)

THEORY IN ACTION

IHI's Age-Friendly Health Systems

[Access multimedia content \(<https://openstax.org/books/population-health/pages/26-5-older-adult-health>\)](https://openstax.org/books/population-health/pages/26-5-older-adult-health)

Evidence-based practice is important to health promotion and disease prevention for older adults. While the Institute for Healthcare Improvement's (IHI, n.d.) Age-Friendly Health System initiative was designed originally for hospital and clinical settings, population health nurses can also use the concepts. In this video, Dr. Mary Tinetti, Chief of Geriatrics at the Yale School of Medicine and Yale-New Haven Hospital, describes the components of an age-friendly health system.

Watch the video, and then respond to the following questions.

1. What does it mean that older adults become more heterogeneous as they age?
2. Why were the 4Ms chosen as concepts in the age-friendly health system?
3. What are the 4Ms in the age-friendly health system?
4. What nursing interventions could be implemented to address each 4M?

Primary Prevention

Primary prevention strategies typically focus on maintaining the health of healthy older adults and preventing the development of chronic diseases and frailty. Examples of primary prevention (Lenartowicz, 2022) include:

- Immunizations, such as the influenza, pneumococcal, tetanus, and zoster vaccines
- Chemoprevention using aspirin for the prevention of coronary heart disease and stroke, if applicable
- Lifestyle changes, such as smoking cessation, avoidance of trans fats, increased intake of fruits and vegetables, moderate physical activity, adequate calcium and vitamin D intake, and limited caffeine and alcohol intake
- Specific recommendations for prevention of frailty including exercise and a low-fat, reduced sodium, high-calcium, high-fiber diet with calcium and vitamin D supplements

Secondary Prevention

Secondary prevention of disease in the older adult population aims to detect and treat disease or its complications before symptoms or functional losses occur. An older adult may have minimal or no chronic disease but require secondary prevention. The primary method of secondary prevention is screening. Multiple organizations publish screening guidelines, which can differ. The following are Medicare-covered preventive service guidelines for older adults (Highmark, 2023b):

- Weight, height, and BMI monitoring annually
- Blood pressure screening annually
- Lipid panel every 5 years or as clinically indicated
- Fasting plasma glucose in those who are overweight or obese annually
- Mammography every 1 to 2 years until age 75
- Chlamydia and gonorrhea screening for older women who are at increased risk for infection
- Syphilis, HIV, and hepatitis B screening for those at increased risk for infection
- Hepatitis C screening
- Colorectal cancer screening until age 75
- Bone mineral density screening of women aged 65 to 69 years and men aged 70 years and over every 2 years
- Prostate cancer screening for men aged 55 to 69 years, if clinically indicated
- Lung cancer screening for those aged 50 to 80 years who have a 20 pack-year smoking history and currently smoke or have quit within the past 15 years

Another secondary prevention important for older adults is screening for fall risk. As mentioned, the CDC's (2023h) [STEADI](https://openstax.org/r/cdcsteadi) (<https://openstax.org/r/cdcsteadi>) provides a coordinated approach for nurses and other health care providers to implement the practice guideline for fall prevention. Videos for health care providers and older adults can be viewed on the CDC website.

CLIENT TEACHING GUIDELINES

Environmental Safety for Older Adults

The community health nurse should teach older adults or their caregivers to do the following:

- Keep emergency numbers at hand, including 911, poison control, a family member or friend's number to call in case of emergency, and the health care provider's office number.
- Consider a special alarm that can be worn as a bracelet or necklace. The button can be pushed in case of a fall, and emergency services will be notified.
- Try not to rush to answer the phone. Carry a cordless or cell phone when moving around the home, or let an answering machine pick up messages.

- Wear nonslip footwear, such as slippers with rubber/no-slip bottoms or flat, thin-soled shoes that fit well.
- Use a cane or walker, if needed, rather than relying on holding on to walls or furniture.
- Make sure all hallways, stairs, and paths are well-lit and clear of any objects such as books or shoes.
- Use rails and banisters when going up and down stairs. Never place scatter rugs at the bottom or top of stairs.
- Tape all area rugs to the floor so they do not move when walking on them.
- If there is a fire in the home, leave immediately and call 911. Do not attempt to put a fire out.
- Do not wear loose clothes or long sleeves when cooking.
- Replace appliances with frayed or damaged electrical cords.
- Do not put too many electrical cords into one socket or extension cord.
- Ensure smoke detectors are installed and batteries are changed twice a year.
- Never smoke in bed or leave candles burning, even for a short time, in an empty room.
- Make sure heaters are at least three feet away from anything that can burn, such as curtains, bedding, or furniture. Turn off space heaters when leaving a room.
- Set the water heater thermostat no higher than 120°F to prevent scalding.
- Have grab bars installed in the shower and near the toilet.
- Put rubber mats in the bathtub to prevent slipping.
- Consider a special tub/shower chair or raised toilet seat if there are difficulties with getting in and out of the tub, standing for long periods in the shower, or getting on or off the toilet.
- Never try to heat the home with the stove, oven, or grill.
- Place a carbon monoxide detector near all bedrooms, and test and replace the battery twice a year.
- Keep all medications in their original containers to prevent mix-ups.
- Ask the pharmacist to put large-print labels on medications to make them easier to read.
- Take medications in a well-lit room so that labels can be easily seen.
- Never mix bleach, ammonia, or other cleaning liquids together when cleaning.
- Keep windows and doors locked at all times.
- Never let a stranger into the home when they're alone.
- Talk over offers made by telephone salespeople with a friend or family member.
- Do not share personal information, including Social Security number, credit card or bank information, or account passwords, when contacted by unknown individuals.
- Always ask for written information about offers, prizes, or charities and wait to respond until the information has been thoroughly reviewed.
- Do not feel pressured into making purchases, signing contracts, or making donations before discussing with a family member or friend.

(See Health in Aging Foundation, 2019.)

Depression screening is important in identifying social isolation in older adults. If clients feel lonely or isolated, they may benefit from assistance in increasing social contacts to prevent morbidity. Those who are depressed warrant appropriate intervention. Older adults should be encouraged to remain as productive as possible, engage in leisure activities, and maintain a sense of social connectedness in order to help prevent psychosocial problems and physical disability (Lenartowicz, 2022).

Tertiary Prevention

Tertiary prevention is designed to manage an existing, symptomatic, and typically chronic disease to prevent further functional loss. Older adults with the following chronic disorders can potentially benefit from tertiary prevention:

- Arthritis to prevent progression or falls
- Osteoporosis to prevent progression or fractures
- Diabetes to prevent retinopathy, neuropathy, nephropathy, coronary artery disease, and foot ulcers or amputation
- Vascular disorders to prevent disabling events such as myocardial infarction or stroke
- Heart failure to reduce functional decline, hospitalization, and mortality
- COPD to decrease the number and severity of exacerbations and the need for hospitalization (Lenartowicz,

2022)

As with the adult population, disease-specific care management programs are useful in addressing these disorders. Chronic care clinics and specialists may also be used with older adults. Interventions to address polypharmacy, mentioned earlier, are also considered tertiary prevention. Medication reconciliation is an excellent mechanism for preventing difficulties resulting from polypharmacy (Coppard et al., 2019).

Integration of Sociocultural and Linguistically Responsive Interventions for Older Adults

Integrating sociocultural and linguistically responsive interventions for older adults promotes health equity and improves health outcomes. This section has described the older adult population's diverse ethnic backgrounds and recognized that health disparities exist among older adults, such as high rates of chronic diseases, particularly among older adults from certain racial and ethnic backgrounds. Access to care is often also impacted. While social isolation may be a significant concern for many older adults, it is particularly difficult for those from cultural minority groups. Additionally, older adults or their caregivers may have unique health needs related to their cultural backgrounds. By integrating sociocultural and linguistically responsive interventions, nurses can better address the needs of this population, improving their health outcomes and quality of life.

Sociocultural Interventions

Social connections and supports are essential for healthy aging, but these may be affected by the sociocultural environment, particularly a community's values and beliefs. Howell (2020) performed a study to examine the relationship between the sociocultural factors that shape diet, physical activity, and nutritional status outcomes among Alaska Native and African American Alaskan older adults. The study found that participants' diet and physical activity practices did not meet national recommendations. Howell (2020) also found that incorporating friends in interventions led to increased energy expenditure in participants, and family members influenced increased fruit consumption. Participation in cultural social events increased participants' intake of fats and sweets. The media was also found to be a strong influencer of participants' behavior, as 85.4 percent reported daily television watching, and was recommended as a way to reach older adults with socioculturally responsive programs to alleviate some of the barriers to healthy diet and exercise (Howell, 2020).

Older adults also frequently experience pain. Reis et al. (2022) described the importance of recognizing cultural factors' influence on how individuals perceive, respond to, communicate, and manage pain. Pain education should be provided using different culturally appropriate examples, metaphors, images, and delivery methods. Reis et al. found that a culturally sensitive educational session require a good communicator who will listen to client concerns, recognize the legitimacy of their pain, and respect their culture, values, and preferences. Failure to do this negatively impacts the educational session. The nurse should assess a client's beliefs about pain, as these may range from pain being a normal part of aging to being a punishment from a higher power for bad deeds. Reis et al. (2022) recommend using several different audiovisual aids, including those the client can take home to share with friends and family.

Linguistically Responsive Interventions

Language barriers can limit access to health care in any population. Older adults who speak a language other than English may face language barriers that limit their ability to understand their disease or even access health care services. The National Council on Aging (2022) spotlighted a senior center in Nebraska that served seniors with language barriers. The members of the Intercultural Senior Center (ISC) spoke over 15 languages, including Spanish, Korean, Nepali, Karen, and Burmese, and ISC staff included individuals from at least 10 different countries who spoke a variety of languages. Specific services offered by ISC included linguistic and cultural accessibility, access to and navigation of legal and health services, transportation, and social engagement (National Council on Aging, 2022).

Chapter Summary

26.1 Maternal Health

Health promotion and disease prevention related to maternal health focuses on the well-being of the pregnant client during pregnancy, childbirth, and the postpartum period, with an emphasis on prenatal care, common complications and risk factors, strategies for the promotion of healthy pregnancies, and interventions to address health disparities and the population health nurse's role in promoting self-care among pregnant people. Taking a holistic approach considers sociocultural and linguistic factors to best impact the health of the childbearing client and their infant.

26.2 Newborn, Infant, and Toddler Health

The early years of a child's life are crucial for their development. Nurses must understand the risk factors, common health issues, educational needs for caregivers, and age-appropriate education for this population. Strategies to support optimal growth and development include immunizations, regular checkups, and nutritional guidance. Early intervention addresses potential health issues, promotes healthy behaviors in caregivers, and provides a foundation for lifelong well-being to increase the likelihood of children becoming productive and economically stable adults.

26.3 Preschool, School-Age, and Adolescent Health

Promoting health and preventing disease in children from preschool through adolescents is necessary for their lifelong well-being. Clients in this age group form habits and behaviors during this time frame that will impact their health for years. By fostering healthy habits and behaviors during these formative years,

Key Terms

abusive head trauma (AHT) a preventable, severe form of physical child abuse that results in injury to the brain of an infant or child; includes shaken baby syndrome

ageism discrimination against older people because of negative and inaccurate stereotyping

alcohol-related birth defects (ARBD) congenital disorders due to FASD in which the infant may have problems with the heart, kidneys, bones, and/or hearing

alcohol-related neurodevelopmental disorder (ARND) an FASD in which the infant may experience intellectual disabilities and/or problems with behavior and learning; may have difficulties in

nurses can help establish a foundation of health for the rest of these children's lives. Prevention strategies include immunization and education to empower this population to make informed decisions about every aspect of their health. Using health promotion and disease prevention, this age group can develop healthy lifestyles and reduce their risk of developing chronic diseases.

26.4 Adult Health

Through a focus on the top causes of death in adults, health promotion and disease prevention address both chronic, noncommunicable diseases and communicable diseases. Adult health topics include healthy habits, screenings, immunizations, the effects of diseases on vulnerable populations, and the impact of sociocultural and linguistic factors on health. These strategies can provide adults with the ability to best safeguard themselves, their communities, and their overall health.

26.5 Older Adult Health

As the older adult population continues to grow and many live independently, it is imperative that population health nurses implement health promotion and disease prevention interventions to address their health care needs. This includes establishing supportive environments, healthy communities, and social safety nets. Health promotion and disease prevention impact the well-being and quality of life for older adults. Older adults must stay informed about healthy lifestyle choices in conjunction with any disease processes and collaborate with nurses and other health care professionals to develop personalized plans for maintaining good health.

school, particularly with math, memory, attention, and judgment, as well as poor impulse control

code-switching the mixing of two languages during a conversation that often occurs in dual language learners

concussion a traumatic brain injury caused by a bump, blow, or jolt to the head or body, which causes the person to experience any of a defined set of signs or symptoms

developmental disabilities a group of conditions due to an impairment in physical, learning, language, or behavior areas, which begin during the developmental period, may impact day-to-day functioning, and usually last throughout the lifetime

dual language learners (DLLs) children who are learning two or more languages simultaneously or learning a second language while still learning their first language

elder abuse an intentional act or failure to act that causes or creates a risk of harm to an older adult

family engagement the process used to build genuine relationships with families to promote strong parent-child relationships, family well-being, and better outcomes for children and families

fetal alcohol spectrum disorders (FASDs) a group of conditions that can occur in a person who was exposed to alcohol before birth

fetal alcohol syndrome (FAS) an FASD in which the infant exhibits central nervous system (CNS) problems, minor facial features, growth problems, or problems with learning, memory, attention span, communication, vision, and/or hearing; may have difficulties in school and trouble getting along with others

gestational diabetes diabetes that can develop during pregnancy; caused when the body cannot make enough insulin to meet its needs during pregnancy

infant mortality rate the number of children dying under 1 year of age divided by the number of live births that year

low birth weight (LBW) a newborn weighing less than 2,500 grams at birth

multiple gestation the term for pregnancy with twins, triplets, or more fetuses

Review Questions

1. A community health clinic provides care to clients during the prenatal, perinatal, and postnatal periods. What is an example of a primary prevention intervention the community nurse at the clinic might implement?
 - a. Administering Rhogam to clients who are Rh-negative
 - b. Screening clients for gestational diabetes during pregnancy
 - c. Providing education on prenatal nutrition and exercise to clients
 - d. Administering antibiotics to prevent group B streptococcus transmission
2. Which educational intervention by the nurse would be most effective in promoting self-care for a childbearing client in their second trimester who is diagnosed with gestational diabetes?
 - a. Providing a list of local support groups for pregnant clients with gestational diabetes
 - b. Teaching the client how to monitor blood glucose levels at home
 - c. Giving the client a strict diet plan to follow that limits sugars
 - d. Scheduling weekly checkups to closely monitor their condition
3. Which health promotion intervention should the community health nurse teach to new parents to reduce the risk of sudden unexpected infant death (SUID)?
 - a. Place the baby on a firm sleep surface
 - b. Put the baby in the same bed as the parents
 - c. Use extra blankets in the crib during sleep
 - d. Position the baby on the stomach

neonatal abstinence syndrome (NAS) a treatable condition that occurs in newborns exposed to certain drugs, particularly opioids, in utero

neonatal opioid withdrawal syndrome (NOWS) a term used specifically to describe the symptoms experienced by infants exposed to opioids in utero

neurobehavioral disorder associated with prenatal alcohol exposure (ND-PAE) an FASD in which the delivering client must have consumed more than 13 alcoholic drinks per month of pregnancy (that is, any 30-day period of pregnancy) or more than two alcoholic drinks in one setting, and the child must have problems in three defined areas

obesity adult body mass index (BMI) of 30 or higher

preeclampsia a sudden spike in a pregnant client's high blood pressure

preterm birth when a baby is born before 37 weeks of pregnancy

sexual risk behavior any sexual behavior (typically condom-unprotected oral, vaginal, or anal intercourse) that puts one at risk for one or more defined adverse health outcomes

sudden infant death syndrome (SIDS) the sudden, unexpected death of a baby less than 1 year old that does not have a known cause even after full investigation

sudden unexpected infant death (SUID) umbrella category for all sudden, unexpected infant deaths from known causes, such as injury or accident, and those from unknown causes

4. Which action should the nurse take to promote family engagement during a community class on healthy toddler nutrition?
 - a. Provide standardized healthy food guidelines to all families
 - b. Learn about each family's cultural practices and beliefs related to food and health
 - c. Implement interventions related to food choices based on the nurse's personal beliefs
 - d. Encourage the family to only provide the healthy food options suggested
5. The community health nurse is teaching caregivers with children between 5 and 9 years of age about causes of injury in this age group. Which cause of death will the nurse include?
 - a. Suicide
 - b. Choking
 - c. Drowning
 - d. Illegal drugs
6. Which condition would the school nurse tell caregivers of adolescents is a protective relationship factor that can protect against suicide?
 - a. Social media
 - b. Family support
 - c. Peer pressure
 - d. Community suicide cluster
7. Which health disparity would the public health nurse apply when developing community adult health education programs?
 - a. Men have a higher life expectancy compared to women.
 - b. Women experience higher rates of cerebrovascular disease compared to men.
 - c. Women have a higher mortality rate compared to men.
 - d. Men experience higher rates of COPD compared to women.
8. The community health nurse is developing a primary prevention program for children. Which intervention would the nurse promote?
 - a. Immunizations according to recommended schedules
 - b. Regular vision screenings
 - c. Speech therapy for children with developmental delays
 - d. Medical care for health problems
9. Which intervention would the public health nurse implement in the community to address the Healthy People 2030 goal of reducing falls in older adults?
 - a. Provide assistive ambulation devices
 - b. Encourage sedentary activity
 - c. Reduce inappropriate medications
 - d. Ambulate only with a caregiver
10. The public health nurse is providing education to families of older adults in the community about risk factors for elder abuse. Which factor would the nurse include in this teaching?
 - a. The older adult's level of physical activity
 - b. The frequency of visits from family and friends
 - c. The presence of chronic health conditions in the older adult
 - d. The presence of mental illness in the older adult

CHAPTER 27

Caring for Vulnerable Populations and Communities

FIGURE 27.1 Two individuals who are homeless sit on a sidewalk in Toronto despite the weather. One of the roles of community and public health nurses is assisting these clients in finding shelter. CHAPTER OUTLINE

- 27.1 People Who Are Experiencing Homelessness
 - 27.2 Veterans
 - 27.3 The LGBTQIA+ Community
 - 27.4 Migrant Workers
 - 27.5 People with Disabilities
 - 27.6 Impact of Adverse Childhood Experiences
-

INTRODUCTION At age 35, Melissa is without a home and a regular place to sleep at night. She was raised by a single mother who worked multiple waitressing jobs. Melissa worked hard in high school, earned a scholarship to a state college, and took a part-time job to pay for books, fees, and living expenses. One night she was hit by a car and suffered a traumatic back injury that propelled her into a downward spiral of trauma, chronic pain, and medical debt. The medical expenses forced her to drop out of school, and the pain made it impossible for her to keep a full-time job, without which she lacked sufficient income to pay rent. Melissa felt that the health care system stigmatized her because of her medical debt. When she sought relief from her chronic pain, she faced accusations of being a “drug seeker.” Eventually, she gave up on health care and ended up homeless and in despair.

Caring for vulnerable populations and communities, such as individuals like Melissa who are experiencing homelessness, is a key role of the nurse as these populations have multiple risk factors for negative health

outcomes. Structural barriers within society and in the health care system place vulnerable populations, also known as disadvantaged groups, at higher risk for poor health. These groups have poor access to care, receive poor-quality care, and experience poor outcomes related to race, ethnicity, socioeconomic status, gender, sexual orientation, age, primary language, ability, or mental health conditions (Commonwealth Fund, 2023). Multiple social factors, such as living in unsafe neighborhoods, being unable to access quality education, and working in low-wage occupations, put vulnerable populations and communities at a disadvantage, perpetuating their low socioeconomic position. Nurses can meaningfully intervene and improve health outcomes by assessing these populations through the lens of the social determinants of health (SDOH).

This chapter discusses six primary types of disadvantaged populations: individuals experiencing homelessness, veterans, LGBTQIA+ populations, migrant workers, individuals with disabilities, and those who have had adverse childhood experiences. Older adults, immigrants, and refugees are also often considered vulnerable populations; Older adults are discussed in [Health Promotion and Maintenance Across the Lifespan](#), and immigrants and refugees are discussed in [Caring for Populations and Communities in Crisis](#). While no defined set of factors exists to determine whether a population or a community is disadvantaged, one or more of the following characteristics are often used to identify vulnerability (Bhatt & Bathija, 2018):

- Income and education
- Access to primary health care services
- Age
- Gender and sexual orientation
- Social, cultural, and linguistic needs
- Race and ethnicity
- Chronic illness or disability
- Alcohol or substance misuse
- Homelessness
- Human immunodeficiency virus (HIV), acquired immunodeficiency syndrome (AIDS)
- Veteran status
- Migrant status
- Rural residency

Nurses have a duty to ensure equitable and culturally competent care. Disadvantaged populations are often subject to significant health disparities. Recall from [Social Determinants Affecting Health Outcomes](#) that health disparities are preventable differences in health between groups of individuals, usually as a result of social or economic factors, geographic location, and environment (Centers for Disease Control and Prevention [CDC], 2022c). Health disparities often result in health inequities, “differences in health status or health resources between different population groups, arising from … social conditions” (World Health Organization [WHO], 2018, para 2). Health inequities are a result of an unjust system. Since nursing is founded on the principle of social justice, nurses are well positioned to care for vulnerable populations and advocate for systemic changes. Ensuring access to essential health care services, advocating for culturally and linguistically appropriate care, and educating community partners on health needs are steps toward improving the health outcomes of vulnerable populations (Bhatt & Bathija, 2018).

27.1 People Who Are Experiencing Homelessness

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 27.1.1 Define homelessness.
- 27.1.2 Discuss the extent of homelessness in the United States.
- 27.1.3 Identify demographic trends of individuals experiencing homelessness.
- 27.1.4 Describe factors that contribute to homelessness.
- 27.1.5 Explain the health challenges of individuals experiencing homelessness.
- 27.1.6 Describe the role of the nurse in caring for individuals experiencing homelessness.

Nurses need specialized knowledge, skills, and appropriate attitudes to provide effective care for marginalized populations like individuals experiencing **homelessness**. The McKinney-Vento Homeless Assistance Act of 1987 defines homelessness as a situation in which an individual or family lacks a regular, fixed, and adequate nighttime

residence. This includes individuals or families living in shelters or in public or private locations not designed for regular sleeping, such as cars, parks, abandoned buildings, stations, and campgrounds. Homelessness also refers to individuals or families who will be losing their housing within a short timeframe and for whom no new residence has been identified. Incarcerated individuals are not considered homeless. The terms houseless, unsheltered, and unhoused are also used to describe individuals who lack housing (LA Community Alliance [LACA], n.d.).

The challenges of gathering accurate data make it difficult to ascertain the full scope of homelessness in the United States. **Point-in-time counts** provide a snapshot of the number of homeless individuals, both sheltered and unsheltered, on a given night in a given place ([Figure 27.2](#)) (HUD, 2022). The U.S. Department of Housing and Urban Development (HUD) [Annual Homelessness Assessment Report to Congress](#) (<https://openstax.org/r/huduser>) estimates that 582,500 individuals were experiencing homelessness on a single night in 2022 (HUD, 2022). This figure equates to 18 of every 10,000 individuals in the United States. Of the population experiencing homelessness, 4 in 10 were unsheltered. The latest data demonstrates a small increase, less than 1 percent, in homelessness nationally between 2020 and 2022.

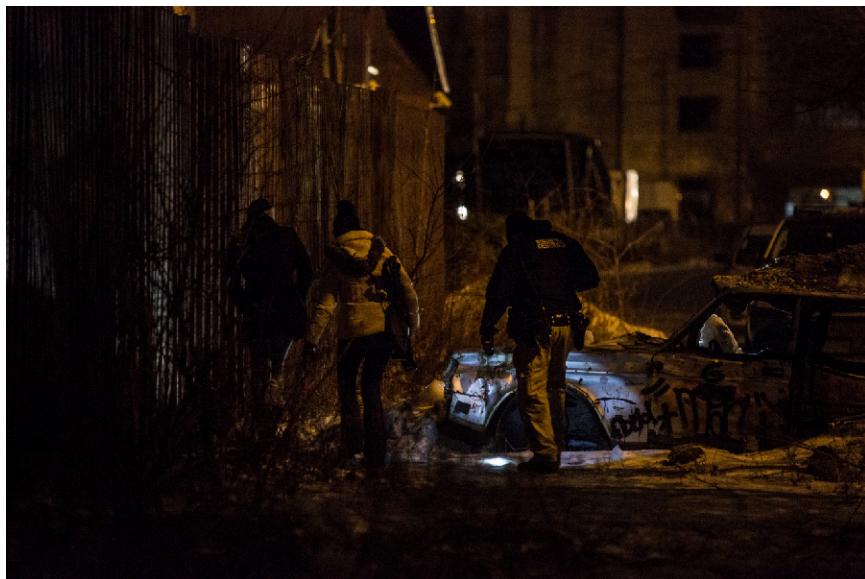

FIGURE 27.2 Volunteers search for people sleeping in makeshift outdoor beds to complete a point-in-time count of individuals experiencing unsheltered homelessness. (credit: "Point in time homeless count 2015-Jan" by Milwaukee VA Medical Center/Flickr, Public Domain)

Demographic Data on Homelessness

Homelessness affects every state in the United States, but more than half of all individuals experiencing homelessness are in four states: California (30 percent), New York (13 percent), Florida (5 percent), and Washington (4 percent). In 2022, more than 70 percent of the homeless population in California and Hawaii were unsheltered, while 90 percent or more of the individuals experiencing homelessness in Vermont, Maine, Wisconsin, and New York had shelter (HUD, 2022). Half of all individuals experiencing homelessness were located in major cities. The demographic characteristics of homeless individuals vary greatly by geographic location.

In the United States, Black, Indigenous, and people of color (BIPOC) communities are disproportionately represented among those experiencing homelessness (HUD, 2022). White, non-Hispanic/non-Latino adult men constituted the most individuals experiencing homelessness in 2022, but relative to the total U.S. population, individuals experiencing homelessness were disproportionately from Hispanic or Latina and BIPOC communities. Among individuals experiencing homelessness, 30 percent were women, while among families experiencing homelessness, 60 percent were women. Homelessness in women increased by 6 percent compared with a 1 percent increase in men between 2020 and 2022. Individuals identifying as Native Hawaiians and Pacific Islanders experienced a 23 percent increase in individual homelessness and a 31 percent increase in unsheltered homelessness. Homelessness among children and families is growing. According to the National Alliance to End Homelessness (NAEH), adults and children in families make up 30 percent of the population experiencing homelessness (2023a). Families experiencing homelessness are often headed by a single woman with limited

education who has young children and struggles with poverty (NAEH, 2023a).

Factors that Contribute to Homelessness

Factors contributing to homelessness include poverty, lack of affordable housing, lack of affordable health care, domestic violence, substance use disorders, and mental illness.

Poverty

Individuals experiencing homelessness are often considered to live in poverty (National Coalition for the Homeless [NCH], 2022a). **Poverty** is when an individual lacks the economic resources to pay for basic needs (Agency for Healthcare Research and Quality, 2022). In the United States, poverty is measured by comparing an individual's or family's income to a set poverty threshold, the minimum income required to cover basic needs. Those who fall under this threshold are considered poor (Institute for Research on Poverty, n.d.), have limited financial resources, and find it challenging to afford housing, food, health care, and childcare, often leading to difficult choices (NCH, 2022a). A common sentiment among individuals living in poverty or near poverty is that “if you are poor, you are one illness, accident, or paycheck away from living on the streets” (NCH, 2022a, para 3). Individuals living in poverty are at high risk of becoming homeless, and demographic groups that are more likely to experience poverty are also more likely to experience homelessness (NCH, 2022a). See [Social Determinants Affecting Health Outcomes](#) for more information on poverty.

In 2021, the official U.S. poverty rate was 11.6 percent, with almost 40 million individuals living in poverty, a little over 15 percent of whom were children (under age 18) (Creamer et al., 2022). The 2020 official poverty threshold for a family of four, consisting of two adults and two children, was a total annual income of \$26,246 or less (U.S. Census Bureau, 2022). The demographic data of individuals living in poverty are consistent with the demographic data of individuals experiencing homelessness, further demonstrating the link between the two. Of the total U.S. population living in poverty:

- 20 percent self-identify as Black;
- 17 percent self-identify as Hispanic (any race);
- 10 percent self-identify as White;
- 9 percent self-identify as Asian; and
- 24 percent self-identify as American Indian or Alaska Native (AIAN). (This is disproportionate; in 2020, AIAN individuals accounted for only 1.1 percent of the U.S. population [U.S. Department of Health and Human Services, 2023a].)

Housing

The shortage of low-income housing in the United States contributes to homelessness. The National Low Income Housing Coalition (NLIHC) reports a shortage of 7 million affordable homes for the nation's almost 11 million extremely low-income families (2023). The NLHIC (2023) also estimates that more than two-thirds of all extremely low-income families spend more than half their income on rent, placing them at risk for homelessness. This problem affects every state.

The NLIHC measures income against what it calls a **housing wage**, an estimate of the hourly wage that full-time workers must earn to afford a rental home at fair market value without spending more than 30 percent of their income on housing. In 2022, the national per-hour housing wage for a modest two-bedroom rental home (\$25) was more than three times the federal minimum wage (\$7.25 per hour) (NLIHC, 2022; U.S. Bureau of Labor Statistics, 2021). Most low-income families facing severe housing problems are working (NCH, 2022b). The lack of affordable housing and limited housing assistance programs contribute to the housing crisis and homelessness (NCH, 2022b). Of all the households eligible for federal housing assistance, only one in four receives assistance due to insufficient funding (NCH, 2022b; Fischer et al., 2021). With the lack of affordable housing, many individuals and families experience high rents, overcrowding, or substandard housing, further placing them at risk of homelessness (NCH, 2022b). Homelessness endures as the income of low-income households has declined, rents have continued to rise, and the demand for assisted housing exceeds supply (NCH, 2022b). Assisted housing is housing for which people receive financial support under governmental programs such as public housing.

Lack of Affordable Health Care

A lack of affordable health care contributes to homelessness, as individuals who cannot afford health insurance are

at risk of financial difficulties and subsequent homelessness if a serious injury or illness arises (NCH, 2022a). It also negatively impacts the overall health of low-income individuals who may not seek needed health care due to cost concerns. Though the percentage of Americans lacking health insurance has fallen to record lows due to expanded Medicaid eligibility, the Patient Protection and Affordable Care Act (ACA), and policy changes that occurred during the COVID-19 pandemic, a significant portion of U.S. residents remain uninsured or underinsured (Collins et al., 2022), and as of 2021, racial and ethnic disparities in coverage persisted (Cha & Cohen, 2022).

According to a Commonwealth Fund survey, in 2022, 43 percent of working adults were inadequately insured, and 46 percent of respondents reported skipping or delaying care due to cost concerns (Collins et al., 2022). The Commonwealth Fund defines underinsurance as having out-of-pocket costs that are 10 percent or more of income in a one-year period (5 percent for individuals living under 200 percent of the federal poverty level) or a deductible that represents 5 percent or more of household income (Collins et al., 2022). According to the CDC National Health Statistics Report, over 28 million individuals, including almost 3 million children, were uninsured in 2021 (Cha & Cohen, 2022). Evidence that health insurance coverage is linked to improved health outcomes was one of the drivers for the passage of the ACA in 2010, which was intended to increase access to health care to decrease disparities and improve health for everyone (Cha & Cohen, 2022).

Domestic Violence

Individuals living in poverty who experience domestic violence may be forced to choose between staying in an abusive relationship or experiencing homelessness. **Domestic violence** refers to violent or aggressive behavior in the home, usually involving abuse of a spouse or partner. In the United States, an estimated 20 individuals per minute are physically abused by an intimate partner, equating to more than 10 million women and men in a one-year period (National Coalition Against Domestic Violence [NCADV], 2020). In 2020, one in four women and one in nine men reported experiencing severe intimate partner physical violence, and one in five reported experiencing sexual violence by an intimate partner in their lifetimes (NCADV, 2020). Domestic violence and homelessness are directly connected, with national estimates that 80 percent of homeless mothers with children have experienced domestic violence (Institute for Children, Poverty & Homelessness [ICPH], 2018). Experiences of domestic violence are common in individuals who become homeless (NAEH, 2023b), and in 2022, roughly 11 percent of beds were set aside for domestic violence survivors and their families (NAEH, 2023b). See [Caring for Families](#) for more information on domestic violence.

Substance Use Disorder

Substance misuse and homelessness are linked, but there is no consensus on whether substance misuse is a precursor to or a result of homelessness (Moxley et al., 2020; NCH, 2022a). Individuals who are experiencing homelessness are much more likely to experience substance misuse than housed individuals, but many individuals begin using drugs or alcohol to cope with the challenges of being homeless (Mosel, 2023; NCH, 2022a). Individuals have unique experiences that may lead to differences in health behaviors. The Substance Abuse and Mental Health Services Administration report that 38 percent of individuals experiencing homelessness misuse alcohol, and 26 percent misuse other substances (Magwood et al., 2020; Mosel, 2023). Individuals experiencing homelessness often lack social support and access to health care, have experienced trauma, and often struggle with untreated mental health illnesses that contribute to the substance misuse in this population (Magwood et al., 2020; Mosel, 2023). See [Caring for Populations and Communities in Crisis](#) for more information on substance use disorder.

Mental Illness

Mental illness does not cause homelessness, but an estimated 25 percent of the adult homeless population experiences persistent mental illness (Vohra et al., 2022). Individual mental health is formed and influenced by the SDOH (Alegria et al., 2018; Knifton & Inglis, 2020; Macintyre et al., 2018). Poverty can be both a cause of mental health problems and a consequence of it (Knifton & Inglis, 2020; Macintyre et al., 2018), and because poverty is directly tied to homelessness, mental illness is considered a risk factor for homelessness. The poverty–mental illness link can create a cycle wherein the stress, stigma, and trauma of poverty may result in poor mental health that may then result in loss of employment or underemployment, which may then result in individuals with mental illness living precariously, in and out of poverty (Macintyre et al., 2018).

How Homelessness Intersects with the Social Determinants of Health

Homelessness intersects with the SDOH at every level. Recall from [Social Determinants Affecting Health Outcomes](#)

that the SDOH are grouped into five domains: economic stability, education access and quality, health care access and quality, neighborhood and built environment, and social and community context. These determinants of health are driven by social status and have a major impact on an individual's health and well-being. Individuals and families experiencing homelessness lack economic stability and cannot access the resources and care necessary for healthy living. This has a domino effect on the other determinants of health, as a lack of economic stability and housing can result in an unstable educational environment, an unsafe or unstable community, and the inability to access clean air, water, transportation, and healthy food options. As noted, BIPOC communities are disproportionately affected by homelessness, which is rooted in generational poverty and structural racism. Generational poverty is persistent poverty and disadvantage, where children who grow up poor are more likely to be poor as adults (Wagmiller & Adelman, 2009). In many cases, the foundation of generational poverty can be traced to the structural discrimination and racism that contribute to inequitable social and economic opportunities (Office of Disease Prevention and Health Promotion [ODPHP], 2020c). Structural discrimination refers to institutional policies, systems, laws, and practices that limit individuals' and populations' opportunities, resources, and power based on race, ethnicity, gender, ability, socioeconomic status, sexual orientation, gender identity, and religion. These deeply rooted practices and beliefs propagate pervasive unjust treatment and oppression of vulnerable individuals (Braveman et al., 2022). See [Structural Racism and Systemic Inequities](#) for more information.

HOMELESS WITHOUT LEGS

[Access multimedia content \(<https://openstax.org/books/population-health/pages/27-1-people-who-are-experiencing-homelessness>\)](#)

The website [Invisible People \(<https://openstax.org/r/invisiblepeople>\)](#) presents several video interviews with individuals experiencing homelessness.

Watch the video about Monica's story, and then respond to the following questions.

1. [The National Health Care for the Homeless Council \(<https://openstax.org/r/nhchc>\)](#) (NHCHC) has stated that housing is a part of health care (2019, p.1). Do you agree with this statement? Why or why not?
2. What are some actions a nurse can take to address the issues discussed in this video?

Health Barriers Experienced by Individuals Experiencing Homelessness

The National Health Care for the Homeless Council (NHCHC) states that "housing is health care" as health and homelessness are interlinked (2019, p. 1). Statistically, individuals experiencing homelessness have higher rates of illness and have an estimated life expectancy of 30 years below the U.S. average (Watts, 2021). Diabetes, hypertension, and myocardial infarction are estimated to be twice as prevalent in groups experiencing homelessness as they are in the general population, and groups experiencing homelessness have even higher rates of substance use disorders, depression, and hepatitis C (Watts, 2021). Other conditions prevalent among this population include behavioral health concerns; communicable diseases such as HIV, tuberculosis (TB), or hepatitis; and conditions affecting dentition and the feet (Mcenroe-Petite, 2020). [Figure 27.3](#) depicts the downward spiral that can occur when a person lacks health care and becomes homeless (NHCHC, 2019, p.1).

FIGURE 27.3 An individual may quickly spiral into homelessness. Injuries or illnesses may result in unemployment, creating a cycle wherein the individual cannot afford health care and the initial health condition prevents them from regaining employment. Loss of income causes housing instability. Without effective safety nets, poor health may lead to unemployment, leading to poverty and, ultimately, to homelessness (NHCHC, 2019, p.1). (attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

Being homeless creates new health issues and intensifies existing ones. Living on the street or in a crowded shelter places an individual under stress and exposes them to communicable disease, violence, malnutrition, and weather. Individuals with chronic health problems such as hypertension, diabetes, and asthma may have no place to store medications properly, thereby worsening their underlying disease process. Maintaining a heart-healthy or diabetes diet is challenging as food pantries and shelters cannot cater to special diets. These situations can exacerbate behavioral and mental health issues such as substance use disorders, alcoholism, depression, and anxiety (NHCHC, 2019). Even minor issues such as a mild cut may develop into more serious problems, as maintaining proper rest and hygiene and keeping bandages clean may be impossible when living in a shelter or on the street. Stable housing provides safety and a place to recuperate from illness or injury. Even the highest-quality clinical services are ineffective if the client's health is "compromised by the street or shelter conditions as no amount of health care can substitute for stable housing" (NHCHC, 2019, p. 2).

BOSTON HEALTH CARE FOR THE HOMELESS

[Access multimedia content \(<https://openstax.org/books/population-health/pages/27-1-people-who-are-experiencing-homelessness>\)](https://openstax.org/books/population-health/pages/27-1-people-who-are-experiencing-homelessness)

In 1985, the Robert Wood Johnson Foundation and the Pew Memorial Trust began the Health Care for the Homeless (HCH) program, funding 19 health clinics around the United States to coordinate medical treatment for individuals experiencing homelessness. HCH funded new respite care programs and provided continuity of care from the streets and shelters to the hospital. There are now 300 federally qualified health centers (FQHCs) and 100 medical respite programs (Watts, 2021). This video features an HCH in Boston.

Watch the video, and then respond to the following questions.

1. What different client needs do the HCH health care professionals address?
2. How is HCH addressing the barriers to accessing health care that individuals experiencing homelessness often face?
3. In your view, is this a sustainable model of health care for individuals experiencing homelessness? Is it replicable in other cities around the country? Why or why not?

Children and Families Experiencing Homelessness

Each year, 1.2 million children ages 5 and under experience homelessness in the United States (U.S. Department of Health & Human Services [USDHHS], 2023b). The McKinney-Vento Act requires school districts to assist students

who are experiencing homelessness in receiving needed services and enrolling them immediately even if they lack the typical paperwork. These students are required to be given transportation and uniforms if necessary to get them into school immediately (Beiner, 2022). Homelessness negatively impacts children's education, health, development, and sense of safety (NAEH, 2023a). Children experiencing homelessness have increased levels of emotional and behavioral problems and increased risk of health problems; are more likely to repeat a grade, be expelled, or drop out of school; and have lower overall academic performance (NAEH, 2023a). They may have a variety of health challenges related to the difficulty in accessing regular health and dental care or nutritious foods, education interruptions, trauma, and overall disruption in family dynamics (USDHHS, 2023b). In comparison to children who are housed, this population is twice as likely to be ill, goes hungry twice as often, has twice the rate of learning disabilities, and is three times as likely to have emotional and behavioral problems (USDHHS, 2023b). Additionally, children experiencing homelessness face social isolation from their peers, increased anxiety levels, disrupted sleep, loss of a sense of place, and an increased risk of adolescent drug misuse (Phillips, 2019). School nurses and other community and public health nurses can assist these families and children in accessing case management services and connecting them with primary health care. They can advocate getting these children the resources they need such as food, clothing, and school supply assistance.

The Nurse's Role in Caring for People Experiencing Homelessness

Nurses interface with individuals experiencing homelessness in many different settings, from the acute bedside to the emergency department (ED) to the outpatient clinic or in community health settings such as schools, shelters, food pantries, churches, community centers, social service agencies, and even in the street. Nurses need to be sensitive to the different needs of these clients.

This population often faces barriers to primary care and, therefore, may seek treatment in the ED, resulting in fragmented care and further stigma and discrimination in health care settings (Mcenroe-Petitte, 2020; Vohra et al., 2022). Many of the conditions common to individuals experiencing homelessness, including chronic diseases, do not lend themselves to treatment in the ED as they often require specific longer-term treatment plans (Mcenroe-Petitte, 2020).

This population needs holistic care with a focus on access to care. The first step in providing care is to ask the client about their living situation; access to food, support, and medication; and what type of work they engage in. Nurses need collaborative working relationships with community-based primary care and psychiatric care providers so that, after identifying client needs, they can tap into that network to assist the client in accessing health services. Additionally, nurses must individualize care for these clients when reviewing discharge paperwork. Advising a client to rest and elevate their leg is not a feasible plan of care for an individual experiencing homelessness. Involving the care team of social workers and case management can assist these clients in obtaining appropriate community-based services to facilitate healing. Nurses have a role in primary, secondary, and tertiary prevention for caring for individuals experiencing homelessness ([Table 27.1](#)).

Primary Prevention

Prevent individuals and families from becoming homeless by addressing contributing factors.

- | | |
|---|--|
| <ul style="list-style-type: none"> • Advocate for affordable housing • Advocate for a living wage • Advocate for affordable, accessible health care • Refer those with mental health disorders to appropriate counseling and therapy • Provide parenting workshops to help families deal with conflict and develop resilience in order to decrease the number of adolescent runaways | <ul style="list-style-type: none"> • Advocate for affordable and high-quality childcare • Provide violence prevention and anger management classes • Advocate for substance use disorder services management and treatment in every community |
|---|--|
-

Secondary Prevention

TABLE 27.1 Nurses' Role in Primary, Secondary, and Tertiary Prevention for Clients Experiencing Homelessness

Decrease existing homelessness.	Screen for early detection and treatment of adverse health conditions in the homeless population.
<ul style="list-style-type: none"> Refer to social support agencies to assist in applying for aid Assist in locating an available shelter Advocate for more short-term residences for families experiencing homelessness Advocate at the state level for more funding for single-room occupancy (SRO) options Advocate for more medical respite facilities Advocate for local social services in every community 	<ul style="list-style-type: none"> Screen for communicable diseases such as HIV, TB, hepatitis, sexually transmitted infections, hypertension, and diabetes Advocate for more community-based health centers that focus on serving disadvantaged populations Advocate for mobile health vans to take clinical medicine to the streets
Tertiary Prevention	
Prevent recurrence of poverty and homelessness.	
<ul style="list-style-type: none"> Advocate for changes at the state and federal level to provide needed services to address chronic homelessness such as providing housing stability and support for those in need. An example is Housing First, a program that prioritizes permanent housing for individuals experiencing homelessness (NAEH, 2022a). It provides permanent housing without prerequisites or conditions beyond those that are typically expected of a renter. 	<ul style="list-style-type: none"> All steps included within primary prevention

TABLE 27.1 Nurses' Role in Primary, Secondary, and Tertiary Prevention for Clients Experiencing Homelessness

27.2 Veterans

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 27.2.1 Discuss health barriers experienced by veterans.
- 27.2.2 Describe veterans' health needs.
- 27.2.3 Explain the nurse's role in caring for veteran populations.

The U.S. Census Bureau estimated that in 2018, 18 million American veterans lived in the United States, approximately 9 percent of whom were women (Vespa, 2020). The largest cohort of veterans alive today served during the Vietnam era and have a median age of 65. Currently, approximately 1.4 million individuals are on active duty across the branches of military (Vespa, 2020).

The **Veterans Health Administration**, a part of the Department of Veterans Affairs (VA), is an integrated health care system that provides care to 9 million veterans. A **veteran** is an individual who is serving or has served in the active military, naval, or air service and who, if they are no longer in the active military, was discharged under conditions other than dishonorable (U.S. Department of Veterans Affairs, 2019). Most veterans are eligible for VA health coverage, yet more than half instead receive care from providers in the community (Yedlinsky et al., 2019; Zychowicz et al., 2022). Reasons cited for receiving care outside the VA health system include more choices, better satisfaction, easier geographic location, and less administrative hassle (Yedlinsky et al., 2019; Zychowicz et al., 2022). Veterans seeking health care outside of the VA are at greater risk for suicide than those who receive their care within the VA. Therefore, community health providers must ask clients about prior military service and understand veterans' health needs (Zychowicz et al., 2022).

Health Barriers Experienced by Veterans

Veterans face many barriers when accessing health care. Studies have demonstrated that nurses and other health care professionals at non-VA health centers have a limited capacity to provide culturally competent care to veterans as they lack an understanding of the life experiences of these individuals (Bonzanto et al., 2019). Veterans also tend to be older and at greater risk for many conditions, some of which are not often seen in the general population. Other barriers include access to care, especially in rural areas, and logistical concerns of transportation and social support (Crowley et al., 2021; Inderstrodt et al., 2022). Veterans are at increased risk for homelessness, often due to unresolved or untreated mental health issues (Elliott et al., 2021; Inderstrodt et al., 2022). According to HUD's [Annual Homelessness Assessment Report to Congress \(<https://openstax.org/r/hudusergovportal>\)](https://openstax.org/r/hudusergovportal), approximately 7 percent of all adults experiencing homelessness in the United States are veterans. These veterans have health needs similar to those of the general population experiencing homelessness, but these needs may be compounded by their prior service. The community health nurse must understand the dynamics of providing care for clients with these combined needs.

Health Needs of Veterans

Veterans have unique health needs related to their military service. They are more likely than other individuals to experience trauma-related injuries, substance misuse, and mental health disorders, and approximately one-quarter of all veterans have a service-related disability (Vespa, 2020). Veterans are twice as likely as the general population to have musculoskeletal injuries, sometimes resulting in disability, and more than 40 percent experience chronic pain (Zychowicz et al., 2022). [Figure 27.4](#) illustrates one of many common musculoskeletal injuries requiring a prosthesis that affect veterans at higher rates than the general population. Chronic pain and disability further increase the risk for obesity, diabetes, and heart disease secondary to a sedentary lifestyle.

FIGURE 27.4 A veteran with a prosthesis continues to train. (credit: Matt Hecht/Flickr, Public Domain)

Military veterans experience mental health illness at a higher rate than the general population (Yedlinsky et al., 2019; Zychowicz et al., 2022). Depression is linked to many conditions, such as cardiovascular disease, diabetes, and chronic pain. An estimated 11 percent of veterans experience major depressive disorder compared to 7 percent of the general population, and they are at increased risk for suicide. Screening veterans for depression and assessing their suicide risk is extremely important (Zychowicz et al., 2022). Factors impacting suicide risk include combat exposure, traumatic injury, sexual trauma, and substance use (Zychowicz et al., 2022). Post-traumatic stress disorder (PTSD) can develop from events occurring during service, and up to 25 percent of those who served in the military from the Vietnam era through the war in Afghanistan experience PTSD (Zychowicz et al., 2022). Substance use disorders (SUD) are also common among this population, with risk factors being combat exposure, PTSD, traumatic brain injury (TBI), frequent deployments, and frequent family separations. The most-used substances are alcohol, cannabis, and nicotine.

The time period of military service is relevant to veterans' health needs. Many Vietnam veterans were exposed to Agent Orange, a tactical herbicide used to clear vegetation that is now linked to many forms of cancer (U.S. Department of Veterans Affairs, 2022). Agent Orange exposure places these veterans at higher risk for ischemic heart disease, diabetes, Parkinson's disease, and peripheral neuropathy (D'Aoust & Rossiter, 2021). In addition, Vietnam veterans have high rates of hepatitis C, PTSD, and homelessness. They experience psychological distress from the war atrocities they experienced, and many who returned home to antiwar protests in the 1960s may feel shame and guilt related to societal attitudes about the Vietnam War. Veterans from the wars in Iraq (2003–2011) and Afghanistan (2001–2014) are at increased risk for TBI and PTSD. With TBI, the impact of multiple blast exposures may result in sleep disorders, hearing loss, chronic pain, and gastrointestinal conditions (D'Aoust & Rossiter, 2021). Additionally, exposure to burn pits of incinerated waste, chemicals, weapons, plastics, and more is common in veterans from Iraq and Afghanistan, resulting in potential respiratory diseases (D'Aoust & Rossiter, 2021).

Over the next 15 years, the number of women in the military is projected to increase to approximately 17 percent (D'Aoust & Rossiter, 2021). A woman's military experience presents unique health care challenges. Thirty-three percent of women (one in three) and 1 percent of men (one in 100) report experiencing **military sexual trauma** (MST), sexual assault or harassment that occurs during military service (D'Aoust & Rossiter, 2021). MST is associated with mental health issues such as PTSD, eating disorders, dissociative disorders, and personality disorders. These veterans are also at higher risk for suicide and self-harm than those without a history of MST (D'Aoust & Rossiter, 2021). Women veterans who experienced MST are less likely to seek care promptly due to general distrust of the health care system and associated mental health issues (Inderstrodt et al., 2022).

How Veteran Status Intersects with the Social Determinants of Health

Veterans are at increased risk for homelessness, often due to unresolved or untreated mental health issues, many related to their time in service (Elliott et al., 2021; Inderstrodt et al., 2022). The SDOH intersect with veterans' health in a bidirectional manner throughout the lifespan. For example, education can affect those who initially choose to enter the military, and military training and college education benefits for veterans impact overall educational attainment (Duan-Porter et al., 2018). Some studies have found that the SDOH significantly impact who volunteers to enter the military, as evidence shows that veterans have experienced greater childhood adversity than non-veterans (Duan-Porter et al., 2018). Other determinants of health, such as gambling, substance use, depression, and PTSD, also disproportionately affect veterans.

The Nurse's Role in Caring for Veterans

Community and public health nurses interface with veterans regularly, as they live in the community, and many veterans seek care in community-based or private health care centers. Familiarity with this population's health needs and challenges is key to providing culturally appropriate care. Nurses can affect positive changes in care for veterans by seeking and advocating for appropriate training on military separation issues, how clients' military history may affect health risks, and how to address emotional health concerns (Crowley et al., 2021).

When nurses are aware of veteran health needs, they can screen these clients more holistically and spot subtle signs of physical or mental illness. From appropriate screening to advocating for unmet health needs or issues with access to care, nurses can positively impact the health of this vulnerable population. Studies have found that veterans often feel invisible, forgotten, or undervalued and struggle to access the care they need. This results in veterans, like individuals experiencing homelessness, overutilizing the emergency department (Weber et al., 2020). Nurses can advocate for better access to care while also appropriately referring veterans to health services in the community, a case management role. Nurses have the requisite knowledge and skills to translate this case management need into action. An acute awareness of this population's mental health challenges and needs enables nurses to assist veterans in accessing necessary mental health services.

Veterans with PTSD and other mental health conditions have higher rates of tobacco use, hypertension, hyperlipidemia, and obesity than veterans without mental health diagnoses, underscoring the need for primary and secondary prevention (Reisinger et al., 2012). Primary prevention aims to block the onset of conditions or diseases for which this population is at higher risk, and secondary prevention focuses on screening to detect disease onset early to provide immediate treatment to decrease the risk of adverse health outcomes ([Table 27.2](#)).

Primary Prevention	
Prevent veterans from developing substance use disorders	Prevent the onset of chronic diseases such as hypertension, hyperlipidemia, and obesity
<ul style="list-style-type: none"> Provide health promotion sessions on the adverse effects of tobacco use Provide health promotion sessions on alcohol and drug misuse 	<ul style="list-style-type: none"> Provide health promotion sessions on a heart-healthy diet and exercise to promote cardiovascular health
Secondary Prevention	
Substance use	Chronic health conditions
<ul style="list-style-type: none"> Screen veterans for tobacco use Screen veterans for alcohol and cannabis misuse Screen veterans for general substance use 	<ul style="list-style-type: none"> Screen veterans at each visit for hypertension Each year, screen veterans for hyperlipidemia and for obesity with a body mass index reading Screen veterans at each visit for depression, PTSD, and suicide risk
Tertiary Prevention	
<ul style="list-style-type: none"> Provide appropriate resources for the management of mental health conditions Provide appropriate referrals for the management of traumatic brain injuries, musculoskeletal issues, and pain management Provide support for military families living with and caring for veterans with chronic health needs 	

TABLE 27.2 Nurses' Role in Primary, Secondary, and Tertiary Prevention for Veterans

27.3 The LGBTQIA+ Community

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 27.3.1 Discuss health barriers experienced by the LGBTQIA+ community.
- 27.3.2 Identify the health needs of the LGBTQIA+ community.
- 27.3.3 Describe the nurse's role in caring for LGBTQIA+ individuals.

Lesbian, gay, bisexual, transgender, queer, intersex, and asexual (LGBTQIA+) individuals live in every community, hail from all walks of life, and represent every racial, ethnic, socioeconomic, and geographic group (CDC, 2019c). Both LGBTQIA+ individuals and **sexual minority youth** (SMY)—young individuals who identify as lesbian, gay, or bisexual; who are not sure of their sexual identity; or who have had same-sex partners—experience many health disparities and challenges. In particular, LGBTQIA+ adolescents are at high risk of experiencing bullying, dying from suicide, and using illegal substances. Many Health People 2030 objectives relate to these three major concerns (ODPHP, 2022b). Sexual and gender minority groups are subjected to harassment, discrimination, and violence due to unjust practices, policies, and social conditions (CDC, 2022b). Individuals who identify as transgender experience higher rates of discrimination and higher rates of interpersonal violence (Medina-Martinez et al., 2021). See [Table 27.3](#) for examples of the many terms commonly used to describe gender and sexual identity.

HEALTHY PEOPLE 2030

LGBTQIA+

Many Healthy People 2030 objectives relate to [improving the health, safety, and well-being of LGBTQIA+ individuals \(<https://openstax.org/r/healthdatabrowse>\)](#). These objectives highlight the importance of collecting population-level health data on LGBTQIA+ health issues and improving the health and safety of LGBTQIA+ individuals with an emphasis on the adolescent population.

What is LGBTQIA+?*	
L – Lesbian	A woman whose physical and romantic attraction is to other women. Some may prefer to identify as gay or as gay women.
G – Gay	An individual whose physical and romantic attraction is to people of the same sex. Most often refers to men, but some women prefer to identify as gay.
B – Bisexual	A person who forms physical and romantic attractions both to those of the same gender and to those of another gender. Bisexual people do not need to have had specific sexual experiences to be bisexual.
T – Transgender	An umbrella term for people whose gender identity and/or gender expression differs from what is typically associated with the sex they were assigned at birth. People under the transgender umbrella may describe themselves as transgender or nonbinary. Some transgender people undergo treatment to bring their bodies into alignment with their gender identity.
Q – Queer/Questioning	An adjective used by some people whose sexual orientation is not exclusively heterosexual or straight. This umbrella term includes people who have nonbinary, gender-fluid, or gender-nonconforming identities. Once considered a pejorative term, some LGBTQIA+ people have reclaimed <i>queer</i> to describe themselves; however, it is not a universally accepted term even within the LGBTQIA+ community. Sometimes, the Q in LGBTQ can also describe someone questioning their sexual orientation or gender identity.
I – Intersex	An adjective used to describe a person with one or more innate sex characteristics, including genitals, internal reproductive organs, and chromosomes, that fall outside of traditional conceptions of male or female bodies. Having an intersex trait is different from being transgender. Medical providers and parents assign an intersex person a sex at birth, either male or female – and that assignation may not match the gender identity of the child. Not all intersex individuals identify as being part of the LGBTQIA+ community.
A – Asexual	This adjective describes a person who does not experience sexual attraction.
+ – Plus	The “plus” is used to signify all the gender identities and sexual orientations that letters and words do not yet fully describe.

Other Terms Commonly Used

Cisgender	Used to describe a person whose gender identity aligns with the sex assigned at birth.
Gender identity	One’s self-concept as male, female, a blend of both, or neither. How individuals perceive themselves and what they call themselves.
Gender non-conforming	Individuals who do not behave in a way that conforms to traditional expectations of their gender or whose gender expression does not fit into a category.
Gender fluid	A person who does not identify with a single fixed gender or who has a fluid or unfixed gender identity.
Nonbinary	Describes an individual who does not identify exclusively as a man or a woman. Nonbinary individuals may identify as both a man and a woman, somewhere between, or outside of these categories.

TABLE 27.3 Terms Commonly Used to Describe Gender and Sexual Identity (See Human Rights Campaign, 2023; Lesbian & Gay Community Services Center, Inc., 2023.) *Note: Throughout this section, a variety of acronyms are used based on the source material where the information was retrieved.

Health Barriers Experienced by the LGBTQIA+ Population

Throughout U.S. history, many policies and practices have discriminated against and stigmatized the LGBTQIA+ population. Same-sex sexual activity only became legal in every state in 2003 with the Supreme Court’s ruling in *Lawrence v. Texas* (CDC, 2022b). LGBTQIA+ individuals have faced discrimination in finding housing and jobs and in family court (CDC, 2022b). Similarly, until the 2015 Supreme Court ruling in *Obergefell v. Hodges*, many states did not recognize same-sex marriages. This impacted health insurance coverage and job protections for family leave

(CDC, 2022b). Same-sex marriage bans further stigmatized this population and made same-sex couples unequal in the eyes of the justice system.

LGBTQIA+ individuals also experience significant harm due to structural discrimination, threats, verbal abuse, or violence (CDC, 2022b). In 2022, 17 U.S. states lacked state laws against discrimination based on sexual orientation or gender identity in employment, housing, and public accommodations (Movement Advancement Project, 2023). The medical community and health care system have also discriminated against LGBTQIA+ populations. Until 1973, the American Psychiatric Association classified homosexuality as a mental disorder (CDC, 2022b). From 1923 to 1981, individuals in Oregon who participated in same-sex sexual activity were sterilized without their consent (CDC, 2022b). These historical injustices have impacted accessing and seeking care for LGBTQIA+ populations. In many studies, LGBTQIA+ individuals report avoiding necessary health care because they feel uncomfortable and unsafe due to discriminatory attitudes and behaviors in health care systems (Medina-Martinez et al., 2021).

In 2022, anti-LGBTQ legislation took effect across several U.S. states. In Florida, South Dakota, and Alabama, bills passed restricting classroom discussions of gender and sexuality (Rummel, 2022; USA Facts, 2023), creating a stigmatized atmosphere of constraint and silence around LGBTQIA+ individuals. As of the 2023 legislative session, the American Civil Liberties Union (ACLU) was tracking 492 anti-LGBTQ bills advancing through state legislatures. These bills were attempting to:

- weaken nondiscrimination laws,
- allow businesses and hospitals to turn away LGBTQ individuals,
- limit access to books about LGBTQ individuals,
- limit discussion and education on LGBTQ individuals and issues,
- ban drag show performances,
- ban affirming health care for transgender youth,
- block funding to medical centers that offer gender-affirming care,
- prevent transgender students from participating in sports, and
- prevent transgender individuals from using public bathrooms and locker rooms (ACLU, 2023).

Both implicit and explicit discrimination result in the unfair treatment of individuals or groups based on certain characteristics such as sexual orientation or gender identity (ODPHP, 2020b). **Implicit discrimination** is considered unconscious, shaped by previous experiences and learned associations of certain qualities and social categories. This can result in inequitable care when professionals communicate bias or make biased clinical decisions (National LGBT Health Education Center, 2018). Physical or verbal expressions of bias may determine whether LGBTQIA+ clients follow prescribed health advice or return for care (National LGBT Health Education Center, 2018). Examples of biased communication include referring to same-sex partners as “friends” or excluding same-sex partners from health conversations. Heteronormativity, the belief that heterosexuality is the normal, better, or only sexual orientation (Ferrari et al., 2021), can result in **heteronormative** behaviors, such as discussing oral contraception with all women of childbearing age regardless of their sexual orientation, that reflect implicit bias.

Explicit bias is a consciously held negative attitude or belief about a specific individual or group based on certain characteristics, such as sexual orientation or gender identity. Explicit biases are easily identified and communicated and result in the inequitable treatment of individuals or groups (Vela et al., 2022). Examples of explicit bias include health professionals refusing treatment to LGBTQIA+ individuals on the basis of their sexual or gender orientation or displaying open hostility and rudeness toward these individuals, such as not respecting their preferred name or pronouns (Medina-Martinez et al., 2021).

CASE REFLECTION

Addressing Implicit Bias

The National LGBTQIA+ Health Education Center offers a series of cases exploring scenarios clients encounter frequently in health care settings to provide strategies for nurses and other health care staff to move past bias and provide holistic, culturally congruent care.

Access the [Case Studies](https://openstax.org/r/lgbtqia) (<https://openstax.org/r/lgbtqia>) and scroll to page 3; read through the 10 short case

scenarios, and then respond to the following questions.

1. In what ways did the scenarios challenge or confirm your ideas about bias toward LGBTQIA+ clients in the health care system? Did one scenario resonate with you more than others? Why?
 2. Have you ever experienced these types of situations in health care, either as a client, an observer, or in the role of health care staff? If you could revisit a past experience, what, if anything, would you do differently?
 3. The scenarios emphasize that no one is an expert, regardless of their personal experience, and that learning and training benefits all health care professionals. As a future nurse, how prepared do you feel to address such biases in health care? What are some ways you might learn more?
-

Health Needs of the LGBTQIA+ Population

LGBTQIA+ individuals have poorer overall physical and mental health than their cisgender, heterosexual counterparts. This population has higher rates of anxiety and depression, many types of substance use, and suicide (Medina-Martinez et al., 2021). Lesbian and bisexual women have higher rates of obesity, osteoporosis, and cancers of the colon, liver, breast, ovaries, and cervix (Medina-Martinez et al., 2021). Gay and bisexual men have higher rates of HIV, viral hepatitis, sexually transmitted infections (STI), and cancers of the anus, prostate, testicle, and colon. Transgender people have higher rates of self-harm and suicide (Medina-Martinez et al., 2021).

SMY experience significantly higher levels of violence, harassment, bullying, and sexual violence in school, resulting in a greater risk of suicide, depression, and substance use than in heterosexual youth (CDC, 2020h). LGBTQIA+ youth face social stigma, discrimination, and social rejection regarding their sexual choices or identities. Given these factors, LGBTQIA+ students are at much higher risk for adverse health outcomes related to sexual behaviors, experiences with violence, substance use, mental health, and poor academic performance (CDC, 2020h). The CDC's 2017 Youth Risk Behavior Survey found that, compared with their heterosexual peers, SMY were more likely to have experienced the following (CDC, 2019d):

- Been bullied at school (32 percent of LGB students vs. 17.1 percent of heterosexual students)
- Seriously considered suicide (46.8 percent of LGB students vs. 14.5 percent of heterosexual students)
- Felt sad or hopeless (66.3 percent of LGB students vs. 32.2 percent of heterosexual students)
- Used select illicit drugs (27.8 percent of LGB students vs. 12.7 percent of heterosexual students)
- Been forced to have sex (19.4 percent of LGB students vs. 5.5 percent of heterosexual students)
- Misused prescription opioids (12 percent of LGB students vs. 6.4 percent of heterosexual students)

LGBTQIA+ youth are also at increased risk for many negative health outcomes. Adolescent gay and bisexual males have high rates of HIV, syphilis, and other STIs, and adolescent lesbian and bisexual females are more likely to have been pregnant than their heterosexual counterparts. Transgender youth are more likely to have attempted suicide than their heterosexual peers (CDC, 2019c).

How LGBTQIA+ Experiences Intersect with the Social Determinants of Health

The experiences of LGBTQIA+ individuals intersect with the SDOH at the individual and community levels related to income, education, social cohesion, and the structural factors of community characteristics and government policies. **Minority stress**—the stigma, prejudice, and discrimination experienced by individuals and groups due to marginalized or vulnerable identities—is a key SDOH for sexual minority individuals (Schuler et al., 2021). Health disparities are driven by unequal distribution of health determinants, and this remains true in the LGBTQIA+ population (Schuler et al., 2021). Research has documented key economic disparities among LGB individuals (Schuler et al., 2021). Gay and bisexual males earn anywhere from 11 to 27 percent less than heterosexual males with the same occupation, education, and experience, and bisexual women have significantly higher rates of poverty than their heterosexual counterparts, even after adjusting for demographic factors (Schuler et al., 2021).

Social connectedness is another SDOH that has an impact on LGBTQIA+ individuals. Social isolation is associated with elevated mortality risks, and LGB individuals experience lower social connectedness than their heterosexual counterparts, as LGB adults are significantly less likely to be married, and older gay and bisexual men are more likely than heterosexual men to live alone. As discussed in [Social Determinants Affecting Health Outcomes](#), incarceration contributes to poor health in many ways. National data indicate that females who identify as a sexual minority are disproportionately overrepresented in correctional facilities, with 42 percent of women and 39 percent

of girls who are incarcerated identifying as a sexual minority (Schuler et al., 2021). In addition to the health risks of incarceration, such as isolation, communicable diseases, and limited economic opportunities upon release, sexual minority status is the largest risk factor for victimization while incarcerated (Schuler et al., 2021).

The Nurse's Role in Caring for the LGBTQIA+ Population

Achieving health equity for LGBTQIA+ clients requires nurses and other health professionals to view current health inequities through the lens of structural discrimination. Using that lens, community and public health nurses can look for ways to address and decrease this discrimination and its effects (Medina-Martinez et al., 2021).

Protective factors that promote sexual health and positive outcomes among LGBTQ youth include acceptance and support from caregivers and peers, particularly regarding sexual orientation and gender identity, and school-based gay-straight alliances ([Figure 27.5](#)). Gay-straight alliances are student-led clubs that provide a safe place for students to support each other on issues related to sexual orientation and gender identity (CDC, 2019e). Community and public health nurses can assist transgender and other gender-diverse youth by offering quality sexual health education, assisting youth in accessing quality health care services, and providing a safe and supportive environment for these at-risk individuals (CDC, 2019f).

The transgender population faces particular stigma, health disparities, and challenges. Adolescent transgender individuals are at increased risk for experiencing violence, poor mental health and suicide, substance use, and risky sexual behaviors (CDC, 2019f). Despite these risks, adolescents are often resilient, capable of withstanding or recovering quickly from adversity. This resilience acts as a protective factor against stigma and discrimination. By connecting transgender individuals with quality sexual health education, access to health services, and supportive environments, community health nurses can help these adolescents to overcome adversity and flourish (CDC, 2019f). Understanding the experiences of the transgender youth population enables community and public health nurses to create more supportive environments for them. Nurses and other health professionals should take part in transgender cultural competency trainings and participate in the establishment of clinic protocols regarding confidentiality, chosen name, and chosen pronoun (CDC, 2019f).

The community health nurse is well-positioned to impact the health and wellness of the LBGTQIA+ population, especially LBGTQIA+ youth. School nurses can foster a sense of support, safety, belonging, and inclusion for these students. These nurses can support and conduct programs on inclusive sexual education, gender and sexual diversity, and bullying and suicide prevention topics (Medina-Martinez et al., 2021). The school nurse can help administrators review policies and practices to ensure inclusivity and provide or refer students to comprehensive, affirming sexual health services (CDC, 2019f). In the community outside of school, the community health nurse can foster social bonds among peers, teachers, community groups, and organizations that support LGBTQIA+ issues. By creating a community that fosters this environment, community health nurses can collaborate with other community leaders to address health risk behaviors within the LGBTQIA+ population and to provide appropriate sexual health education and services (CDC, 2020h).

FIGURE 27.5 LGBTQIA+ groups can advocate for equity and inclusion in the community and beyond. (credit: Kevin Bacher/NPS/Flickr, CC BY 2.0)

Nurses can also play a role in reducing health inequities in the LGBTQIA+ population by being aware of implicit biases and actively working against them. Nurses can take implicit association tests (IATs) to help identify implicit biases and then learn strategies to minimize their impact. Mindfulness meditation and individuation training that focuses on individual characteristics and traits rather than group membership have successfully reduced implicit bias (Morris et al., 2019). Nurses should also participate in training related to LGBTQIA+ cultural competence among health professionals (Medina-Martinez et al., 2021). By using appropriate pronouns, actively listening to clients, avoiding assumptions based on gender or appearance, and advocating for a culturally appropriate health care environment, nurses can help counteract health inequities. Nurses play a role in primary, secondary, and tertiary prevention for caring for the LGBTQIA+ population ([Table 27.4](#)).

Primary Prevention

- The school nurse should emphasize bullying prevention with educational sessions and posters and encourage administrators to adopt a zero-tolerance policy for bullying behaviors.
- The school nurse can develop and implement policies to promote a positive school environment of safety and belonging for all students.
- The school nurse can promote acceptance of LGBTQIA+ individuals by educating students and school staff about gender identity and sexual orientation.
- The school nurse can encourage teachers to include age-appropriate information about LGBTQIA+ individuals in their lesson plans. Examples include discussions on different kinds of families or studying the civil rights movements for sexual minority individuals.
- The community and public health nurse can advocate for laws and policies that specifically protect the rights of LGBTQIA+ individuals, such as anti-bullying laws to protect all students.

Secondary Prevention

- Screen students who are at risk for being bullied or at risk for academic or emotional problems.
- Encourage support groups for sexual minority students such as gay–straight alliances as means for these students to talk about their experiences at school and in the community.
- Screen LGBTQIA+ individuals for depression, anxiety, suicide risk, and victimization.

Tertiary Prevention

- Refer individuals who are experiencing social and emotional challenges to appropriate community services.

TABLE 27.4 Nurses' Role in Primary, Secondary, and Tertiary Prevention for the LGBTQIA+ Population

27.4 Migrant Workers

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 27.4.1 Define the term migrant workers.
- 27.4.2 Discuss the health barriers migrant workers face.
- 27.4.3 Describe the health needs of the migrant worker population.
- 27.4.4 Identify the nurse's role in caring for migrant workers.

According to the World Health Organization (WHO) (2022), millions of migrants worldwide work dangerous, low-skilled jobs and live and work in substandard conditions. **Migrant workers** are often mobile, moving frequently to locations that offer work, most often in a seasonal pattern. A **migrant farmworker**, also commonly called a **migratory seasonal agricultural worker** (MSAW) or mobile worker, is an individual who is required to be absent from a permanent residence to seek paid employment in agricultural work (Migrant Clinicians Network [MCN], 2023b, para 1). In contrast, immigrants lawfully move to another country to live there permanently.

Globally, migration has evolved and changed. Migrants are now working in industries and communities that never before relied on migrant workers, such as Alaskan salmon fisheries or Wisconsin industrial dairy farms (MCN, 2023c). A few migration patterns have emerged: migrants moving back and forth between their home country and country of migrant work; agricultural workers moving frequently within one country following seasonal changes in work opportunities; and new immigrants searching for opportunity and more stable conditions (MCN, 2023c). In 2020, 281 million people were living outside of their country of birth, and in the United States, over 51 million people were born outside of the country (MCN, 2023c).

An estimated 2.9 million farmworkers reside in the United States, a large majority of whom are immigrants. Sixty-three percent of all U.S. agricultural workers were born in Mexico, and 36 percent lack authorized work status (Farmworker Justice, 2023). Education and literacy are limited among farmworkers, who often have an average formal education ending at ninth grade (Farmworker Justice, 2023). Approximately 15 percent of farmworkers travel long distances to find work, some traveling across the U.S.–Mexico border and some in the United States, especially to Florida, Texas, Arizona, and California. Communities of farmworkers have high levels of poverty as few have benefits such as sick leave, paid vacation, unemployment insurance, or health insurance. Despite this poverty, most farmworkers do not receive federal benefits such as food stamps, the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC), or Medicaid. Women comprise 34 percent of the agricultural workforce and face additional obstacles such as sexual harassment, fear of reporting sexual harassment, and lack of appropriate health care (Farmworker Justice, 2023; National Center for Farmworker Health [NCFH], 2022).

Health Barriers Experienced by Migrant Workers

Migrants are among the most susceptible and overlooked members of society (WHO, 2022). For many reasons, migrant workers have poorer health outcomes than typical individuals in their host communities (WHO, 2022). They often lack access to health and dental care due to economic instability, lack of health insurance, migratory lifestyle, language barriers, cultural differences, geographic location, and a lack of familiarity with the health care system (MCN, 2023a). Because this population tends to move frequently, they often cannot establish a primary care home or develop relationships with providers and nurses, inhibiting their ability to receive appropriate health screenings, education, and follow-up care. Language and cultural differences are also barriers to overall health and dental care. The complexities of navigating unfamiliar health care facilities, policies, and insurance requirements lead some migrant workers to delay care or avoid the system altogether.

Migrant farmworkers in the United States legally can receive health insurance under the ACA and Medicaid if their annual income is below 138 percent of the federal poverty line. Due to farm labor shortages, the United States created the H-2A guest worker program to bring in temporary agricultural workers. In 2021, the U.S. Department of Labor approved 317,619 H-2A visas (NCFH, 2022). Workers with an H-2A visa can receive health insurance under the ACA, but due to their temporary status, employers are not required to provide them with health insurance, so they may need to pay for it themselves. Co-pays and deductibles often present barriers to low-income migratory workers seeking medical care. In 2021, almost 80 percent of MSAWs were considered low-income, with an income at 200 percent of the federal poverty level, and nearly half had no insurance (NCFH, 2021c). Farmworkers in the United States illegally cannot receive health insurance either privately or through the ACA.

The Migrant Health Act of 1962 authorized primary and supplemental health services to migrant and seasonal farmworkers. Today, 177 federally funded Migrant Health Centers (MHCs) are run by either community-based organizations or by governmental entities such as state and local health departments, serving MSAWs and their families. In 2021, there were nine migrant health–only programs in Maine, Massachusetts, North Carolina, South Carolina, Georgia, Minnesota, Kansas, Iowa, and Montana, providing care irrespective of ability to pay (NCFH, 2021c). Despite the availability of MHCs in some geographic regions, economic instability remains a health barrier due to a lack of transportation and the inability to afford to take a day off from work.

CASE REFLECTION

Stories from the Field

Stories from the Field is a collaboration between the nonprofit Farmworker Justice and photojournalist David Bacon that gives farmworkers and their families a voice to talk about their experiences and the challenges they face.

Read [Teresa's story](https://openstax.org/r/farmworkerjustice) (<https://openstax.org/r/farmworkerjustice>) and [Ramona's story](https://openstax.org/r/fieldramona) (<https://openstax.org/r/fieldramona>), and then respond to the following questions.

1. What health conditions do Teresa and Ramona experience? How are these conditions related to their work?
2. In your view, do communities have an ethical duty to do more to protect the rights of these individuals? Why or why not?

Health Needs of Migrant Workers

Hazardous work and living conditions place migrants at risk for adverse health outcomes. In the legal and occupational regulatory systems, a history of agricultural exclusions has resulted in inadequate job protections for farmworkers (MCN, 2023a). The Migrant and Seasonal Agricultural Worker Protection Act (MSPA) of 1983 established employment standards regarding wages, housing, and transportation, among others, but exclusions remain (MCN, 2023a). Health issues occurring more frequently in this population include diabetes, heart disease, arthritis, and TB (MCN, 2023a). Dangerous working conditions often result in musculoskeletal strains, falls, trauma, lacerations, and illnesses related to chemical, pesticide, extreme temperature, and allergen exposures (Figure 27.6) (MCN, 2023b). Workers' families who travel with them are at increased risk for similar adverse health outcomes. For these reasons, migrant farmworkers have higher morbidity and mortality rates than the majority of the U.S. population (MCN, 2023b).

FIGURE 27.6 These migrant farmworkers harvest sweet potatoes in the fields. Exposure to the hot sun, strenuous manual labor, and pesticides are just a few health risks they face. (credit: Lance Cheung/USDA/Flickr, Public Domain)

Maternal child health care among this population is a considerable health need. Of the estimated 2.5 to 3 million migrant and agricultural workers in the United States, more than 25 percent are women, and more than 50 percent

are parents. Studies have found that fewer than half of pregnant agricultural workers accessed prenatal care within the first 3 months of pregnancy compared to 76 percent of women who access prenatal care early nationally. Half of the agricultural worker women monitored gained less weight than recommended during their pregnancies, and close to 24 percent had undesirable birth outcomes (NCFH, 2018).

Barriers to oral health include lack of dental insurance, the cost of dental repair, long travel times to receive dental care, and cultural and linguistic barriers. This has both physical and psychosocial effects. Oral disease is very visible, marking individuals as “second-class citizens” and increasing social exclusion (NCFH, 2018c).

THEORY IN ACTION

How Building a Community of Care Can Improve Farmworkers' Health

[Access multimedia content \(<https://openstax.org/books/population-health/pages/27-4-migrant-workers>\)](https://openstax.org/books/population-health/pages/27-4-migrant-workers)

This short video highlights the Community of Care program in Southeast Arizona as a way to improve farmworkers' health.

Watch the video, and then respond to the following questions.

1. What barriers to accessing health care do the farmworkers experience?
2. What is the role of the *promotoras de salud* described in the video? Why are they effective?
3. In your view, will building this “community of care” improve the health outcomes of farmworkers and their families? Why or why not?

Social Determinants of Health Affecting Migrant Workers

Structural factors, including political, commercial, economic, and social factors, directly impact migrant workers' health and well-being globally. Lack of migrant worker rights and protections negatively affect the health of these individuals and their families. Because employers can pay migrant workers minimal compensation for difficult labor performed under suboptimal conditions, these individuals cannot seek appropriate care for their illnesses or injuries or leave their jobs due to their precarious economic situation.

The health inequities migrant workers experience are a direct result of individual and structural SDOH (Evagora-Campbell et al., 2022). The WHO's [World Report on the Health of Refugees and Migrants \(<https://openstax.org/r/whoint>\)](https://openstax.org/r/whoint) reports that migrants' ill health compared to their host communities is the result of suboptimal individual determinants such as income, education, housing, and access to services, exacerbated by linguistic, cultural, legal, and other barriers (WHO, 2022). According to this report, compared with non-migrant workers, migrant workers are more likely to have occupational-related injuries and less likely to use health services. Limited or restricted access to health services exacerbates these health problems (WHO, 2022). [Table 27.5](#) demonstrates how the SDOH are directly related to migrant workers' health concerns.

SDOH	How It Occurs	Negative Outcomes
Economic insecurity		
Poverty	<ul style="list-style-type: none"> • Performing low-wage work • Being born into generational poverty • Lack of social or political influence • Lack of legal status in the host country, in some cases • Beginning migrant work at an early age 	<ul style="list-style-type: none"> • Limited access to reliable, safe housing and neighborhoods • Limited access to health or dental care • Limited access to an adequate variety of healthy foods • Limited access to transportation • Limited access to educational opportunities

Neighborhood and Built Environment

TABLE 27.5 Intersectionality of Migrant Workers with the SDOH (See MCN, 2023a; NCFH, 2018a; NCFH, 2021a.)

SDOH	How It Occurs	Negative Outcomes
Food insecurity	<ul style="list-style-type: none"> • Lack of access to an adequate variety of healthy foods because of economic circumstances • Lack of transportation to grocery stores • Consumption of highly processed, easily stored foods related to a lack of a means to store and cook fresh food appropriately 	<ul style="list-style-type: none"> • Food insecurity leads to poor nutritional status and potential adverse health outcomes like obesity, diabetes, hyperlipidemia, and hypertension. • Food insecurity is linked to learning disorders in children, and symptoms of depression in children and adults.
Substandard housing	<ul style="list-style-type: none"> • Using unsafe drinking water for drinking, cooking, bathing, and cleaning • Living in an overcrowded environment • Experiencing inadequate sanitation • Living in an unheated or inadequately heated structure • Living in an unsafe substandard structure with a substandard electrical system • Inhaling or absorbing pesticides in the home via application drift 	<ul style="list-style-type: none"> • Contaminated drinking water and inadequate sanitation are associated with many negative health outcomes, including infectious diseases. • Overcrowding is associated with increased communicable diseases, food insecurity, and poorer mental health. • Substandard heating and electrical systems are associated with hypertension and respiratory issues. • The unsafe conditions in substandard buildings and structures create health hazards.
Environmental conditions	<ul style="list-style-type: none"> • Inhaling or absorbing pesticides through their skin while on the job • Inhaling or absorbing pesticides in the home via application drift • Inhaling or absorbing toxic household and industrial cleaners and industrial chemicals • Working outdoors in extreme weather, poor air quality related to wildfires or high humidity, and disease-carrying vectors • Working outdoors without an adequate supply of drinking water 	<ul style="list-style-type: none"> • Pesticides may affect the nervous and endocrine systems, act as carcinogens, or cause skin or eye irritation. • Children exposed to pesticides are at increased risk for learning delays and long-term disabilities. • Extreme heat may lead to heat exhaustion, sunburn, and dehydration. • Accumulated sun exposure places individuals at higher risk for skin cancer. • Poor indoor and outdoor air quality puts individuals at increased risk for respiratory illnesses.
Educational environment	<ul style="list-style-type: none"> • Migrating between May and November interrupts schooling. • Children working in agriculture can work an unlimited number of hours outside of school hours, starting at ages 10 to 11. • Children 12 and older can work on tobacco farms, a practice banned in many other countries due to the work's toxic nature. 	<ul style="list-style-type: none"> • This population's high school dropout rate is four times the national rate. • Children exposed to pesticides are at increased risk for learning delays and long-term disabilities.

TABLE 27.5 Intersectionality of Migrant Workers with the SDOH (See MCN, 2023a; NCFH, 2018a; NCFH, 2021a.)

The Nurse's Role in Caring for Migrant Workers

Migrant health needs are often managed in community settings where community health nurses can make a lasting

positive impact. To ensure better health outcomes, nurses need to advocate for the health of migrant workers, who have very little economic or political power. Nurses can help these individuals navigate the complex health system and push for more access and affordable care options. To address transportation barriers, public health nurses can advocate for mobile health units to visit migrant housing centers, a great upstream intervention. School and community nurses have a duty to advocate for the health and welfare of the children in the community. These nurses can advocate for fair labor laws and policies that govern other nonagricultural work, free school breakfasts and lunches, and appropriate health screenings and care.

MSAW clients frequently experience chronic diseases such as hypertension, diabetes, asthma, and eczema, being overweight or obese, and mental health disorders like anxiety and depression (NCFH, 2021c). Community and public health nurses can tailor nursing interventions to address these health issues. For example, education and advocacy efforts can target improving policies, providing healthy food options at little to no cost, and funding accessible telehealth mental health services. Community nurses can work with local businesses, officials, and community food programs to address food insecurity. Nurses can also partner with migrant and seasonal head start programs or farm-to-preschool programs to help provide children with appropriate education, health resources, and food (NCFH, 2021a).

Community health centers (CHC) are a resource for populations with limited access to health care, such as migrant workers. These community-based organizations are classified as CHCs rather than MHCs because they do not receive federal migrant health funding. Community health workers (CHWs) often play a key role in promoting migrant health by facilitating health promotion and disease prevention activities and programs to increase access to services, provide translators, and enhance the cultural competency of health programs (Emery et al., 2022). Community and public health nurses should become familiar with local migrant and community health centers, especially in rural areas, to spread awareness of their services and help migrant workers access and coordinate care. Nurses have a role in primary, secondary, and tertiary prevention for caring for migrant workers ([Table 27.6](#)).

Primary Prevention

- Educate migrant workers on measures to reduce pesticide exposure
- Educate clients on the benefits of immunizations and administer them as appropriate
- Teach migrant farmworkers how to stay hydrated and avoid heatstroke
- Educate clients to wear sunblock while working outdoors in addition to hats and clothing that covers skin
- Provide prenatal care as necessary for pregnant clients

Secondary Prevention

- Screen for TB
- Screen for skin cancer
- Screen children for anemia
- Screen for pesticide exposure
- Screen for communicable diseases

Tertiary Prevention

- Treat for pesticide exposure and TB
- Promote rehabilitation following occupational-related musculoskeletal injuries
- Provide referrals as appropriate for obstetric care, mental health care, or other specialty care areas

TABLE 27.6 Nurses' Role in Primary, Secondary, and Tertiary Prevention for Migrant Workers

THEORY IN ACTION

Migrant Clinicians Network

[Access multimedia content \(<https://openstax.org/books/population-health/pages/27-4-migrant-workers>\)](https://openstax.org/books/population-health/pages/27-4-migrant-workers)

In this video, a community outreach nurse discusses what it is like to care for migrant farmworkers in Maine.

Watch the video, and then respond to the following questions.

1. What different roles does Beth Russet, the nurse in the video, play?
2. In your view, is this type of health care effective in managing the health needs of migrant workers? Why or why not?
3. What alternatives to this type of nurse-led health care for migrants could reach more individuals?

27.5 People with Disabilities

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 27.5.1 Define disability.
- 27.5.2 Describe the health barriers individuals with disabilities face.
- 27.5.3 Discuss the health needs of the population of individuals with disabilities.
- 27.5.4 Examine how the health needs of individuals with disabilities intersect with the social determinants of health.
- 27.5.5 Identify the nurse's role in caring for individuals with disabilities.

Individuals with disabilities make up a large minority group in the United States, with over 61 million individuals (approximately one in four people) affected (CDC, 2020g). Disabilities occur across all ages, genders, and racial, ethnic, and social groups. The WHO describes **disability** as an “interaction between an individual’s functional impairments or chronic health conditions and the physical and social environment” (Mitra et al., 2022, p. 1380). In contrast, the medical model often defines disability as an impairment in a person’s body or mind that results in difficulty doing certain activities and interacting with the environment around them (CDC, 2020e). There are many types of disabilities affecting vision, movement, thinking, remembering, learning, communicating, hearing, mental health, and social relationships (CDC, 2020e).

Institutional discrimination, lack of disability cultural competency in health professional curricula, and systemic barriers in the health care system result in significant health disparities between individuals experiencing disabilities and those who are not (National Council on Disability [NCD], n.d.). Health disparities for individuals with disabilities who are BIPOC or living in rural areas are even more significant (Crankshaw, 2023; Steinweg, 2023). Despite the Americans with Disabilities Act (ADA) of 1990 and the Amendments Act of 2008, which mandate equal access to health care services, disparities result from physical inaccessibility of health care settings, inadequate accommodations for communication, ableist discrimination, and implicit and explicit biases among health care staff (Lagu et al., 2022). **Ableism** is the intentional or unintentional discrimination against individuals with disabilities (National Conference for Community and Justice [NCCJ], 2021). This population often experiences unaccommodating health care settings and substandard care. Discriminatory attitudes among health care staff perpetuate health disparities and discourage individuals with disabilities from seeking care (Lagu et al., 2022).

HEALTHY PEOPLE 2030

People with Disabilities

Many Healthy People 2030 objectives relate to [improving the health and well-being of individuals with disabilities](https://openstax.org/r/disabilities) (<https://openstax.org/r/disabilities>). These objectives highlight the importance of promoting the health and well-being of all individuals, regardless of ability, to reduce health disparities and achieve health equity. Recall that health disparities are *preventable* differences in health between groups of individuals, usually due to social or economic factors, geographic location, environment, or ability.

Health Barriers Experienced by Individuals with Disabilities

Individuals with disabilities face frequent barriers to optimal and equitable care, including an inaccessible physical environment, a lack of assistive technology for communication, a lack of understanding, and negative attitudes.

Many physical barriers may prevent individuals from obtaining health care. Individuals with mobility disorders may have difficulty accessing health care facilities due to unaccommodating sidewalks, curbs, and stairs. Inside the building, stairs, small rooms, immobile exam tables, and standing scales that do not accommodate wheelchairs are

additional barriers. ADA regulations for equitable or accessible physical spaces relate only to fixed structures and do not include medical equipment, furnishings, or diagnostic equipment (Iezzoni et al., 2022). For example, a lack of accessible equipment for routine Pap smear screening and mammography screening is common (CDC, 2020a). While hospitals may be more likely to have appropriate equipment for individuals with disabilities, most private health care professional offices and outpatient facilities do not (Iezzoni et al., 2022).

Negative attitudes toward individuals with disabilities impact health care encounters and contribute to disparities in health outcomes. Data from implicit attitude testing among health care professionals across all disciplines has revealed a pervasive ableist bias (Iezzoni et al., 2022). In a 2019–2020 national survey, more than 80 percent of outpatient physicians felt that individuals with significant disability have worse quality of life than nondisabled individuals, and only 40 percent thought they could provide the same quality of care to clients with disability as they do to those without (Iezzoni et al., 2022). These assumptions affect the quality of care this population receives. Health professionals often fail to ask appropriate health screening questions or to actively listen to these clients (CDC, 2020a). For example, in one study health care providers did not ask clients with disabilities about sexual activity and therefore failed to screen them appropriately for human papillomavirus and cervical cancer (Iezzoni et al., 2022). By stereotyping individuals with disabilities as being unhealthy or having a poor quality of life, nurses and other health care professionals perpetuate stigma and health care disparities.

Another barrier experienced by individuals with disabilities is the lack of person-first language. Instead, the language focuses on the disability versus ability. **Person-first language** refers to people first to separate the person from a diagnosis or impairment (Crocker & Smith, 2019). An example is referring to a group of children as "children with intellectual disabilities" versus "intellectually disabled children" or referring to "clients with sensory disorders" rather than "sensory disorder clients". The goal is to focus more on the person rather than the diagnosis to decrease the stigma of a disability or condition. It also contradicts the mindset that everyone with a certain diagnosis is the same (Crocker & Smith, 2019). There is also a push toward identity-first language that views the individual's disability as a large part of that person's identity. For example, the Deaf community is opposed to person-first language as they view deafness as a medical condition that should not be stigmatized (Crocker & Smith, 2019). While person-first language is often taught in health care programs, it is often not used in the clinical setting, creating another barrier for clients with disabilities (Crocker & Smith, 2019).

IMPROVING HEALTHCARE ACCESS FOR PEOPLE WITH DISABILITIES

[Access multimedia content \(<https://openstax.org/books/population-health/pages/27-5-people-with-disabilities>\)](https://openstax.org/books/population-health/pages/27-5-people-with-disabilities)

If nurses and other health care providers do not receive adequate training to practice culturally sensitive care to clients with disabilities, this creates a barrier to care. In this video, Melissa Crisp-Cooper shares her health care experiences as an individual with a disability.

Watch the video, and then respond to the following questions.

1. What are some barriers to receiving quality health care Melissa experienced?
2. What are some potential strategies to mitigate these barriers?
3. How can the community health nurse address disparities in caring for individuals with disabilities?

The CDC describes communication, programmatic, social, and transportation as other common barriers making it difficult for individuals with disabilities to function.

Communication Barriers

The ADA requires local and state governments, businesses, and nonprofits serving the public to communicate effectively with individuals who have communication disabilities (ADA.gov, 2020). Although it is an ADA violation for businesses to require clients to bring another person to interpret or assist in communication (ADA.gov, 2020), many health care providers do not accommodate alternative communication styles. In a large study, physicians reported relying on clients' caregivers to overcome communication barriers and often communicating solely with the caregiver, leaving the client with the disability out of the conversation completely (Lagu et al., 2022). These physicians reported cost and time commitment as challenges to accommodating this population's communication needs (Lagu et al., 2022). Many outpatient providers allot 15 minutes for a client visit, but they may need more time to accommodate alternate means of communication, including working with interpreters and providing health

promotion education materials in large print, Braille, or versions made for screen readers (CDC, 2020a). Some auditory messages, such as oral communication or videos, can be inaccessible for individuals with hearing impairments without American Sign Language interpretation or captioning (CDC, 2020a).

Programmatic Barriers

Programmatic barriers include a lack of accessible equipment or adequate time for medical examinations, inopportune scheduling, and providers' attitudes, knowledge, and understanding of people with disabilities (CDC, 2020a). As discussed previously, there are many physical barriers to accessing quality care, including access to equipment. Clients with disabilities that affect mobility, hearing, seeing, or cognition may require more time for a quality health encounter. Given current reimbursement models and the push to see a certain number of clients per hour, the lack of adequate time for examination is burdensome to many providers (Lagu et al., 2022).

Social and Transportation Barriers

Social barriers to care refer to those SDOH that adversely affect health outcomes. Individuals with disabilities are less likely to have completed high school or be employed and are more likely to have low income levels (CDC, 2020a), placing them at increased risk for economic insecurity, greater adversity, higher levels of chronic stress, and ultimately poorer health outcomes. Additionally, children with disabilities are four times more likely to experience violence, another factor impacting overall poor health (CDC, 2020a). This population may face transportation barriers, including a lack of access to transportation for individuals who cannot drive due to vision, cognitive, or mobility impairments ([Figure 27.7](#)) (CDC, 2020a). Economic insecurity may limit access to a private vehicle for those who can drive. Health visits can become less of a priority without easy access to transportation.

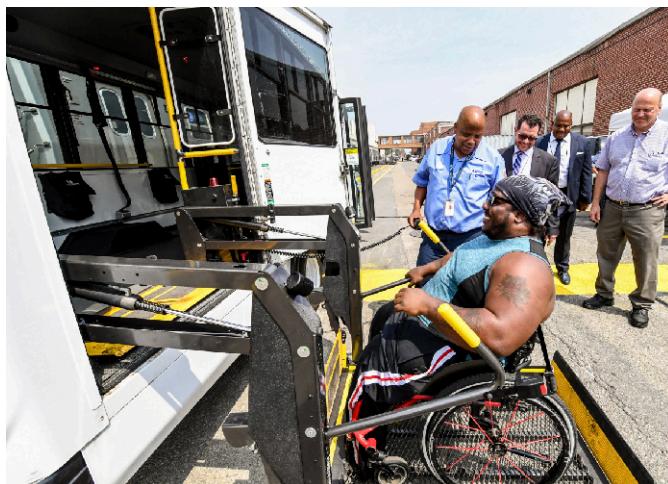

FIGURE 27.7 Transportation can be a barrier to accessing health care for some clients with disabilities. However, there are ways to ensure public transportation is accessible to all. (credit: "MTA Celebrates 31st Anniversary of ADA" by Marc A. Hermann/MTA/Flickr, CC BY 2.0).

Health Needs of Individuals with Disabilities

In the United States, individuals with disabilities are three times as likely as individuals without disabilities to have arthritis, diabetes, and a heart attack and five times as likely to report a stroke, chronic obstructive pulmonary disease (COPD), and depression (NCD, 2023). Individuals living with disabilities are more likely to be obese and have unmet medical and dental needs. Women with disabilities often are not referred for routine pap smears and mammography, and pregnant clients with disabilities have 11 times the risk of maternal death of those without disabilities (NCD, 2023).

This population is at greater risk for **victimization**—purposely perpetrated violence and abuse—than nondisabled individuals. Victimization commonly occurs at home and in hospitals and includes physical and sexual violence, emotional abuse, and neglect of personal needs, medical care, or equipment. Almost 12 percent of adults with a disability were victims of sexual assault compared to 4 percent of adults without a disability (CDC, 2020f). Children with disabilities are more than twice as likely to be physically or sexually abused as children without disabilities (CDC, 2020d). At every health care encounter, these individuals should be screened appropriately for abuse and treated with a trauma-informed lens. **Trauma-informed care** is an approach to providing clinical care that encourages a culture of safety, empowerment, and healing for clients (Rittenberg, 2018). For individuals who have

experienced sexual assault, victimization, or any other trauma, experiences in a health care facility where they are asked sensitive questions, told to remove clothing, undergo invasive testing, or perceive an overall differential in power can be frightening (Rittenberg, 2018). Using a trauma-informed lens means the nurse and health care provider work together to explain why they are asking certain questions or performing certain exams, taking the time to build a rapport with the client. See [Caring for Populations and Communities in Crisis](#) for more information on trauma-informed care.

Individuals with disabilities are more likely to report having overall poorer health and engaging in risky health behaviors such as smoking and physical inactivity than individuals without disabilities (CDC, 2020c). Obesity is more common in children and adults with mobility limitations and intellectual disabilities, resulting in potentially serious health consequences of metabolic syndrome, heart disease, and diabetes (CDC, 2019b). This population may be more vulnerable to preventable health problems and may experience secondary conditions such as pain and fatigue because of their disabling condition.

In addition to poorer physical health, individuals with disabilities report much higher rates of stress and depression than nondisabled individuals (CDC, 2020d). The good news is that many of this population's health needs are preventable, so health care providers and nurses can intervene at a primary prevention level to effect meaningful change for these clients. With this high-risk group, nurses must consistently apply the many evidence-based strategies to combat smoking and physical inactivity.

How Individuals with Disabilities Intersect with the Social Determinants of Health

The health needs of individuals with disabilities intersect with the SDOH, as other forms of marginalization affect the health disparities among this population (Mitra et al., 2022). Transgender adults have much higher rates of disability compared with cisgender men and women, leading some to consider disability from an intersectionality lens—that is, to consider the intersection of disability with other categories of disadvantage such as gender identity, age, and racial and ethnic status (Smith-Johnson, 2022).

In 2018, more than a quarter of individuals with disabilities in the United States lived below the federal poverty level, compared with 10 percent of the nondisabled population (Semega et al., 2021). Poverty is often the result of unemployment, poor educational access, and discrimination (Engelman et al., 2022). Engaging in meaningful work is an essential aspect of a healthy, economically stable adulthood. Unemployment or inability to work is often associated with economic insecurity and poverty, resulting in direct adverse determinants of health. Across all age groups, individuals with a disability are much less likely to be employed, with an unemployment rate twice as high in this population as in that of their nondisabled counterparts (U.S. Bureau of Labor Statistics, 2023).

A person's neighborhood can positively or negatively impact their health. For example, a neighborhood's "walkability" affects the physical mobility of walkers and those with mobility difficulties who are at increased risk for many chronic diseases for which inactivity is a risk factor. Adults with disabilities perceive fewer neighborhood environmental supports and more barriers to walking than their nondisabled counterparts (Omura et al., 2020). Barriers to walkability include a lack of sidewalks, safe walking paths, and curb outlets for wheelchairs.

Like other historically marginalized populations with lower socioeconomic positions, this population is disproportionately affected by environmental conditions like climate change and extreme weather. For example, heat waves adversely impact individuals with spinal cord injuries, diabetes, heart disease, and other neurological conditions (Engelman et al., 2022). While air conditioning helps, not everyone can afford it or the electricity associated with its use. Cooling centers may be inaccessible due to distance, transportation issues, medical conditions, and facility barriers. This is the intersection between disability, lack of employment, and poverty (Engelman et al., 2022).

The Nurse's Role in Caring for Individuals with Disabilities

The role of the community and public health nurse in caring for individuals with disabilities spans the three core functions of public health nursing: assessment, policy development, and assurance. The public health nurse should assess their community's health needs and collect and trend data on the health outcomes of vulnerable populations. Using this data, nurses can appropriately educate health care professionals, organizations, businesses, and clients and devise effective policies to address health care issues and gaps. The public health nurse should then follow up to ensure policies are being implemented.

The inclusion of individuals with disabilities in society involves removing barriers that inhibit their full participation and requires a multifaceted approach that includes (CDC, 2020b):

- Addressing discrimination to allow all individuals to access fair treatment
- Using universal design to make the physical environment and communication space accessible to as many people as possible
- Working to eliminate stigma and stereotypes associated with disabilities
- Providing reasonable accommodations

Additionally, nurses should market community health programs to everyone, including individuals with disabilities. These individuals need these programs, just like everyone else, to engage with and be a part of the community.

27.6 Impact of Adverse Childhood Experiences

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 27.6.1 Define adverse childhood experiences (ACEs).
- 27.6.2 Describe the health needs of individuals who have experienced ACEs.
- 27.6.3 Examine how the health needs of individuals with ACEs intersect with the social determinants of health.
- 27.6.4 Identify the nurse's role in preventing ACEs and caring for those who have experienced ACEs.

Adverse childhood experiences (ACEs) are traumatic childhood events that can have a lifelong negative impact on health (CDC, 2021a; CDC 2022a). Traumatic events may include experiencing violence or neglect, witnessing violence in the home or community, or having a family member attempt or die by suicide. Growing up in an environment that undermines a sense of safety, stability, or bonding—for example, in a household with substance use or mental health problems, instability due to parental separation, or a family member being incarcerated—also contributes to ACEs (CDC, 2022a). ACEs create **toxic stress**, or the prolonged activation of the stress response system, which disrupts the development of brain architecture and increases the risk for stress-related disease and cognitive impairment ([Figure 27.8](#)) (Harvard University Center on the Developing Child [HUCDC], 2023). A normal positive stress response is characterized by short increases in heart rate and mild elevation in hormone levels, as occurs commonly when receiving an injection. A tolerable stress response results in a greater degree of activation of the body's stress response due to a more severe obstacle, such as the loss of a loved one or a natural disaster. If the duration of activation is limited and supported by caring relationships with adults, the brain can recover. The toxic stress response occurs when the child experiences frequent and prolonged adversity such as abuse, neglect, caregiver mental illness, or the accrued burden of economic hardship without adequate caregiver support.

Toxic stress from ACEs negatively affects children's developing brains, immune systems, and stress-response systems, in turn affecting their attention, decision-making, and learning abilities (CDC, 2022a). ACEs' effects increase over time, impacting lifelong health and opportunities (CDC, 2021b). The more ACEs an individual experiences, the higher their ACE score, and the more at risk they become for various poor health outcomes. Associated with chronic health problems, mental illness, and substance use in adulthood, ACEs are entirely preventable. In the United States, 61 percent of adults have at least one ACE, and 16 percent, one out of every six adults, have four or more ACEs (CDC, 2021b). Females and racial and ethnic minority groups are at greater risk for experiencing four or more ACEs (CDC, 2021b).

The Effects of ACEs May Be Cumulative, Affecting Individuals Throughout Their Lives

Repeated, chronic adversity can cause toxic stress in children. In toxic stress, the brain releases fight or flight hormones like cortisol in response to repeated stress or danger.

Toxic stress increases heart rate and blood pressure and damages the digestive and immune systems.

Toxic stress can disrupt organ, tissue, and brain development. Over time, this can impede a person's mental and social-emotional abilities. The consequences of the toxic stress from ACEs may extend throughout a person's life.

Childhood

Adulthood

FIGURE 27.8 This infographic demonstrates the lasting impact of ACEs. (See CDC, 2023a; attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

Health Needs of Children Experiencing ACEs

ACEs are linked to chronic health problems such as heart disease, diabetes, COPD, asthma, cancer, depression, and substance use problems (CDC, 2022a). Five of [the leading causes of death \(https://openstax.org/r/fastats\)](https://openstax.org/r/fastats) are associated with ACEs, with higher numbers correlated with higher risks for poor health outcomes (CDC, 2019a). Preventing ACEs could reduce many adverse health conditions. The CDC estimates that preventing ACEs could help alleviate up to 21 million cases of depression and almost 2 million cases of heart disease; a 10 percent reduction in ACEs could save 56 billion dollars (CDC, 2022a; CDC, 2023b). Evidence shows that preventing ACEs could also positively impact socioeconomic challenges, such as reducing the number of adults who are unemployed or who do not graduate high school (CDC, 2021b). Data suggest that the best way to address these health care needs is to prevent ACEs from occurring in the first place. For those who have already experienced ACEs, many interventions can help the individual recover from the trauma caused by the toxic stress (HUCDC, 2023a).

How ACEs Intersect with the Social Determinants of Health

ACEs intersect with the social determinants of health related to economic stability, education, neighborhood and built environment, and social and community context. Individuals living with economic insecurity or poverty are at increased risk of experiencing ACEs or exposing their children to ACEs. Child maltreatment is more common among families experiencing poverty (Hargreaves et al., 2019). Experiencing food insecurity, moving residences frequently, and generally living in under-resourced neighborhoods all contribute to ACEs and cause toxic stress. ACEs negatively impact education, job opportunities, and income potential, resulting in increased risks of injury, sexually transmitted infections, maternal and child health problems, and involvement in sex trafficking (CDC, 2022a). Children who grow up with toxic stress face many struggles throughout life, such as difficulty forming stable relationships, maintaining a job, and staying financially secure. Adults can pass these effects on to their children, who may face additional exposure to toxic stress from poverty resulting from limited opportunities (CDC, 2022a).

The Nurse's Role in Caring for Children Experiencing ACEs

To prevent ACEs, nurses must understand and address factors that put individuals at risk for violence (CDC, 2022a). Creating a safe and stable environment for children and families, with healthy relationships, is essential to helping children reach their full potential. The CDC encourages communities to adopt and utilize their six strategies for preventing ACEs (CDC, 2022a):

- Strengthen economic supports to families
- Promote social norms that protect against violence and adversity
- Ensure a strong start for children
- Teach skills
- Connect youth to caring adults and activities
- Intervene to lessen immediate and long-term harms

The CDC also recommends raising awareness of ACEs to help change their perception and shift the focus from individual responsibility to broader solutions. Reducing the stigma around seeking help for parenting challenges,

substance misuse, depression, and suicidal thoughts is another community-level strategy. These steps help create safe and stable neighborhoods and communities where each child can thrive (CDC, 2022a). Primary prevention is best, but when this is not possible, community and public health nurses can work with clients to assist them in accessing mental health counseling and treatment specific to trauma. Nurses can also utilize a trauma-informed approach grounded in trust and building rapport with the client, acknowledging that trauma and harm have occurred and finding ways to engage these clients in necessary health care. Some studies have demonstrated that meditation and breathing exercises can assist clients in reducing the effects of toxic stress (HUCDC, 2023a). Nurses have a role in primary, secondary, and tertiary prevention of ACEs ([Table 27.7](#)).

Primary prevention	
Prevent early trauma to improve adult health by reducing sources of stress (CDC, 2021b)	
<ul style="list-style-type: none"> Advocate for affordable housing Advocate for a living wage Advocate for more food assistance programs Advocate for quality early childhood education programs that are accessible and affordable Refer those with mental health disorders to appropriate counseling and therapy 	<ul style="list-style-type: none"> Provide violence prevention and anger management classes Provide parenting classes on how to build healthy, responsive relationships with children Advocate for substance use disorder services management and treatment in every community
Secondary prevention	
Identify clients with ACEs	
<ul style="list-style-type: none"> Advocate for universal adoption of trauma-informed care in health care practice Screen with a standardized ACEs-based tool to assign clients an ACE score based on a brief survey of their personal history Assess clients for protective factors against ACEs 	<ul style="list-style-type: none"> Refer clients to resources such as social work, school agencies, care coordination, and community health workers as appropriate Screen for substance use issues and mental health illnesses annually, with referrals as necessary
Tertiary prevention	
Reduce the impact ACEs have on health and promoting rehabilitation	
<ul style="list-style-type: none"> Assist clients in creating their “own village” of social supports in their neighborhood Educate clients on how to meditate and participate in breathing exercises 	<ul style="list-style-type: none"> Encourage clients to participate in physical exercise Advocate for more community-based health centers that focus on serving vulnerable populations

TABLE 27.7 Nurses’ Role in Primary, Secondary, and Tertiary Prevention of ACEs

Caring for vulnerable and disadvantaged populations and communities requires an interprofessional approach involving many community partners. It will take a concerted effort by health care professionals, government bodies, community organizations, school districts, and local and state policymakers to address the inequitable policies and discriminatory behaviors that affect disadvantaged populations. Nurses and other health care professionals have a major role to play in reducing health inequities in these populations. These professionals can work to change negative attitudes toward the disadvantaged, remove stigma, and advocate for more equitable policies to achieve health equity and social justice. Each of the six disadvantaged populations discussed in this chapter requires nurses who are caring, empathetic, and understanding of their unique lived experiences. Just as nurses should assess for the SDOH at every health encounter, nurses need to assess the lived experience of their clients and recognize that certain risk factors or characteristics place some individuals at inherent disadvantage.

Chapter Summary

27.1 People Who Are Experiencing Homelessness

Homelessness occurs when an individual lacks a regular, fixed nighttime residence. Poverty, lack of affordable housing and health care, domestic violence, and mental illness contribute to homelessness. Groups experiencing homelessness are twice as likely to experience many chronic diseases and disorders and are often exposed to communicable diseases, violence, malnutrition, and weather-related exposures. Overall, the health outcomes of individuals experiencing homelessness are far worse than their housed counterparts.

27.2 Veterans

Veterans living in the United States have unique health needs and are more likely to experience trauma-related injuries, substance misuse, and mental health disorders than those who have not served in the military. Musculoskeletal injuries, chronic pain, and disability are common among veterans, along with depression, PTSD, and SUD, placing them at increased risk for suicide. Every veteran should be screened for depression and assessed for suicide risk. MST is associated with PTSD, eating disorders, dissociative disorders, and personality disorders. MST increases the risk for suicide and self-harm.

27.3 The LGBTQIA+ Community

LGBTQIA+ individuals experience many health disparities and challenges. LGBTQIA+ adolescents are at high risk of experiencing bullying, dying from suicide, and using illegal substances. Sexual and gender minority groups, including individuals who identify as transgender, experience harassment, discrimination, and violence. LGBTQIA+ individuals have poorer overall physical and mental health, with higher rates of anxiety and depression, substance use, and suicide than their cis-heterosexual counterparts.

Key Terms

ableism the intentional or unintentional discrimination against individuals with disabilities

adverse childhood experience (ACE) traumatic event occurring in childhood that can have a lifelong negative impact on health

disability an impairment in the body or mind that results in difficulty doing certain activities and interacting with the environment

domestic violence violent or aggressive behavior within the home, usually involving abuse of a spouse

27.4 Migrant Workers

Migrant populations frequently experience poor continuity of care. Environmental and work stressors cause frequent bouts of illness and long-term debilitating health effects. Migrant families often face limited access to health care, language barriers, low education levels, and few economic or political resources. Communities of migrant farmworkers have high levels of poverty; very few have employment benefits. Migrant farmworkers have higher morbidity and mortality rates than the majority of the American population due to poverty, limited health care access, hazardous working conditions, and a lack of regulations.

27.5 People with Disabilities

Institutional discrimination, ableism, lack of disability cultural competency in health professional curricula, and systemic barriers in the health care system result in significant health disparities between individuals experiencing disabilities and those who are not. Individuals with disabilities face frequent barriers to care, such as an inaccessible physical environment, a lack of assistive communication technology, and negative attitudes. This population reports much higher rates of stress and depression than nondisabled individuals.

27.6 Impact of Adverse Childhood Experiences

ACEs refer to traumatic childhood events, such as experiencing violence or neglect, that can have a lifelong negative impact on health. ACEs create toxic stress that disrupts the development of brain architecture and increases the risk for stress-related disease and cognitive impairment. The more ACEs an individual experiences, the higher their ACE score, and the more at risk they become for a variety of poor health outcomes.

or partner

explicit bias a conscious negative attitude or belief against a specific individual or group based on certain characteristics, such as sexual orientation or gender identity

heteronormative a belief that heterosexuality is the normal, better, or only sexual orientation

homelessness a condition where individuals or families lack a regular, fixed, and adequate nighttime residence; includes individuals or families

living in shelters or living in public or private locations not designed for regular sleeping such as in cars, parks, abandoned buildings, transportation stations, and campgrounds

housing wage the required hourly wage needed to afford a modest two-bedroom rental home without spending more than 30 percent of income on rent

implicit discrimination a form of implicit bias or unconscious bias; a negative attitude against a specific individual or group based on certain characteristics such as sexual orientation or gender identity

migrant farmworker an individual who is required to be absent from a permanent residence to seek paid employment in agricultural work

migrant workers workers that are mobile, moving frequently to locations that offer work, most often in a seasonal pattern

migratory seasonal agricultural worker another term for a migrant farmworker; this term does not specify that the farmworker has to be absent from a permanent residence

military sexual trauma (MST) sexual assault or harassment that occurs during military service

minority stress stigma, prejudice, and discrimination experienced by individuals and groups due to marginalized or vulnerable identities

person-first language referring to people first as a

means to separate the person from a diagnosis or impairment

point-in-time counts counts of the number of homeless individuals, both sheltered and unsheltered, on a given night

poverty a state in which an individual lacks a socially acceptable amount of money or possessions

sexual minority youth (SMY) young individuals who identify as lesbian, gay, or bisexual; who are not sure of their sexual identity; or who have had same-sex partners

toxic stress type of stress that occurs when a child experiences frequent and prolonged adversity such as abuse, neglect, caregiver mental illness, or the accrued burden of economic hardship without adequate caregiver support

trauma-informed care an approach to providing clinical care that encourages a culture of safety, empowerment, and healing for clients

veteran an individual who is serving or has served in the active military, naval, or air service and if they are no longer in the active military, they were discharged under conditions other than dishonorable

Veterans Health Administration (VHA) an integrated health care system providing care to veterans

victimization violence and abuse that is perpetrated purposely

Review Questions

1. Which of the following individuals is experiencing homelessness?
 - a. 17-year-old staying at friend's house due to a disagreement with their parents
 - b. 30-year-old incarcerated following an arrest for drug possession
 - c. 55-year-old sleeping in a car after losing their job
 - d. 40-year-old spending 40 percent of their income on rent

2. Which of the following is considered a primary prevention measure to address homelessness?
 - a. Taking clinical medicine to the streets using mobile health vans
 - b. Advocating for affordable health care
 - c. Referring to social support agencies for housing assistance
 - d. Assisting with locating available shelters

3. Agent Orange is associated with which of the following health outcomes?
 - a. Traumatic brain injuries
 - b. Cancer
 - c. Respiratory diseases
 - d. Hepatitis C

4. Which of the following is an example of heteronormativity in health care?
 - a. Discussing oral contraception with all women of childbearing age regardless of sexual orientation
 - b. Refusing care to a client based on sexual orientation or gender identity
 - c. Using birth-assigned pronouns rather than client-identified pronouns
 - d. Asking the client if they would like their same-sex partner included in the medical discussion

5. A community nurse is caring for migrant workers and their families. Which intervention by the nurse is an example of a secondary prevention measure?
 - a. Educating clients on measures to reduce pesticide exposure
 - b. Providing prenatal care for pregnant clients
 - c. Screening children for anemia
 - d. Providing referrals for mental health care
6. A community nurse has just started working at a migrant health center. When preparing to work with this population, what information is important for the nurse to remember?
 - a. Only the men work in the fields around pesticides.
 - b. Migrant workers are paid the federal minimum wage.
 - c. Since they often live in employer-paid housing, housing and food insecurity is not an issue.
 - d. Many children of migrant workers are forced to work alongside their parents.
7. Which of the following scenarios contains a barrier to care for individuals with disabilities at a clinic?
 - a. The practice is very busy, and 15 minutes are allotted per client encounter.
 - b. Sidewalks with curb outlets and ramps with automated door openers are available.
 - c. A web-based interpreter service that is closed-captioned with large print is used.
 - d. The clinic has large examination rooms with mobile medical equipment.
8. The nurse recognizes that the concept of universal design emphasizes which component?
 - a. Disability needs
 - b. Adaptation
 - c. Access
 - d. Security
9. Which of the following is considered an adverse childhood experience?
 - a. Having a family member with a disability
 - b. Witnessing gang violence in the community
 - c. Arguing with parents over subpar schoolwork
 - d. Living in an area with low socioeconomic status
10. The community health nurse preceptor is discussing vulnerable populations with a student. How does the nurse define a vulnerable or disadvantaged population?
 - a. Groups of people with higher mortality rates
 - b. Groups with a lower life expectancy
 - c. Groups of people who are at increased risk for adverse health outcomes
 - d. Groups experiencing homelessness and mental illness

CHAPTER 28

Caring for Families

FIGURE 28.1 Caring for families requires community health nurses to take a holistic perspective that considers the characteristics and beliefs of the individuals within a family and the family's cultural and socioeconomic context. (credit: modification of work "Family Walking in Medano Creek" by Patrick Myers/Great Sand Dunes National Park and Preserve/Flickr, Public Domain)

CHAPTER OUTLINE

- 28.1 Family as Client
 - 28.2 Frameworks of Practice
 - 28.3 Family Health Nursing
 - 28.4 Conducting a Family Nursing Assessment
 - 28.5 Family Violence
-

INTRODUCTION Dianah, a community health nurse employed by the district health department, is preparing for a home visit with her client, Serjay, who is on a ventilator and has a poor prognosis. Serjay has a large family consisting of his parents, three brothers, one sister, and extended family. The family must make end-of-life decisions. However, the family dynamics are strained. Some family members believe the client should be placed on comfort care, and others want more time. Dianah can see that each side loves Serjay and only wants the best for him, but she frequently ends up mediating family discussions. Nurses often work with complex client family dynamics, especially when clients are nearing the end of their lives.

Dianah's work is typical of community health nursing. Nurses in this field must care for both the individual and the family. Families come in all shapes and sizes, with different risk factors, economic backgrounds, and resources. Nurses must apply a holistic perspective for health promotion, illness prevention, and illness management to individuals, families, and the population. With a focus on the family as client, this chapter describes the functions of the family, frameworks of practice nurses use when caring for the family, conducting a family assessment, and family violence.

28.1 Family as Client

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 28.1.1 Compare definitions of family.
- 28.1.2 Describe common characteristics shared by families.
- 28.1.3 Discuss evolving trends in family structure.
- 28.1.4 Identify the functions of the family.

Working with families can be challenging because of the complex interaction of individual and group values and beliefs within a family. Understanding a family's structure, characteristics, and function is fundamental when working with families to meet their health-related needs.

Definitions of a Family

The definition of family is somewhat elusive (Seltzer, 2019). Definitions of what or who constitutes a family may be based on cultural, national, or religious views. The U.S. Census Bureau (2021b) conceptualizes the family using three distinct terms: **family**, **family group**, and **family household**. [Table 28.1](#) defines each of these terms.

Term	Definition
Family	A group of two or more people (one of whom is the householder, i.e., the person who owns or rents the home) related by birth, marriage, or adoption and residing together (including related subfamily members) are considered as members of one family
Family group	Any two or more people (not necessarily including a householder) residing together and related by birth, marriage, or adoption
Family household	A household maintained by a householder who is in a family (as defined above) and includes any unrelated people (unrelated subfamily members and/or secondary individuals) who may be residing there

TABLE 28.1 U.S. Census Bureau Definitions of a Family

Legal definitions of family may vary based on local, state, and federal laws. For example, same-sex marriage is legally recognized under the 14th Amendment following the 2015 *Obergefell v. Hodges* Supreme Court decision. While U.S. states must uphold this federal ruling, more than 30 states continue to have statutes banning same-sex marriage, although these are unenforceable. If the Supreme Court overturned *Obergefell v. Hodges* in the future, individual states could regulate same-sex marriage, and some states would likely reinstitute prior bans (Mueller, 2022), changing the legal definition of family in these states. Such actions may affect families' access to resources or certain benefits such as the Family and Medical Leave Act (FMLA), a benefit that allows a family member to be absent from work to care for a sick child or spouse (U.S. Department of Labor, n.d.).

In addition to legal definitions, everyone defines family differently based on their own experiences. One person may consider a family only biological parents and siblings, but another person may extend their definition to also include close friends. Families may consist of a single parent, a married couple, grandparents as caregivers, or neither parent as the caregiver. Families may or may not have children. Couples may be married or unmarried, heterosexual, gay, lesbian, bisexual, or transgender.

In some cases, caregivers may not be related biologically to the children, as in families with adopted children, fostered children, or stepchildren. Nurses should recognize the variability among families and not assume family members are biologically related. When working with families, the nurse should clarify a caregiver's connection with a child and not assume the caregiver is the biological parent. The nurse should work nonjudgmentally with all families regardless of their structure.

► DIFFERENT KINDS OF FAMILIES

[Access multimedia content \(<https://openstax.org/books/population-health/pages/28-1-family-as-client>\)](https://openstax.org/books/population-health/pages/28-1-family-as-client)

This video provides an overview of the many different types of families.

Watch the video, and then respond to the following questions.

1. Why is it important for nurses to understand different types of families?
2. In what ways can you use this knowledge in your nursing practice?

Common Characteristics of a Family

Researchers in sociology, psychology, and other disciplines have developed theories to explain family characteristics and development. Popular family theories from the mid-20th century focused on stages and developmental tasks a family goes through over time. One frequently referenced theory identifies six stages in a family's life cycle: Leaving Home (Single Adult), The Joining of Families through Marriage (New Couple), Families with Young Children, Families with Adolescents, Launching Children and Moving On, and Families in Later Life (Berge et al., 2012). This theory is based on a nuclear, traditional **family unit**, assuming the family moves through these life cycle stages progressively over time. Families today may go through these stages at their own pace and in their own way. Some families may skip certain stages—for example, marriage or child-rearing.

Duvall's Family Development Theory offers a similar perspective on the growth and development of families (Martin, 2018). According to Duvall, a family must progress sequentially through certain stages and accomplish certain developmental tasks at each stage (see [Table 28.2](#)). Nurses can use these theories as guides to understand the stages of a family, but again, the theories will not apply to all families as not all couples have children and therefore do not experience stages related to child-rearing.

Stage	Tasks
Married couple without children	<ul style="list-style-type: none"> • Navigating how to live together • Adjusting relationships with families of origin and social networks to include a partner
Childbearing families with the oldest child between birth and 30 months	<ul style="list-style-type: none"> • Preparing and adjusting the family system to accommodate children • Developing roles as parents • Redefining roles with extended families

TABLE 28.2 Duvall's Family Development Theory

While the concept of a family going through a developmental process over time is still widely accepted, these developmental theories have been criticized for their limited applicability to today's more diverse family structures. These theories assume that all families develop similarly, with the same features and cultural norms (Crapo & Bradford, 2021). However, families today are more diverse. For example, over the past decade, the number of LGBTQIA+ families has increased significantly. In an overview of recent research on LGBTQIA+ parents and their children, Carone et al. (2021) found that children in these families tend to thrive and have as good mental health as those in traditional families. In terms of the family life cycle and developmental tasks, these families may be

different with respect to socializing their children to the family's diversity. However, Carone et al. (2021) also note that these diverse families are understudied.

Trends in Family Structure

Regardless of a family's size or composition, all families share some common characteristics. Some family members live within the home, and others live outside of the home. Family members living in the home may be limited to children and parents or may include grandparents, aunts, uncles, and even those with no biological connection.

Families with One Caregiver

According to the U.S. Census Bureau (2022c), in 2022 there were 10.9 million one-parent family groups in the United States with children who were under the age of 18. In 80 percent of single-parent family groups, the parent was a mother; 51 percent of these mothers were never married, and 29 percent were divorced. In single-parent homes where the parent was a father, 41 percent of fathers were never married, and 38 percent were divorced. Sometimes single-parent households are created by choice. Some people prefer to have a child and parent without a partner. Single-parent pregnancy and adoption are becoming more common (Glazer, 2022).

Among single-parent households, a father's involvement varies. Frequently after a marriage ends, a father's involvement decreases or ceases completely (Steinbach et al., 2021). Custody arrangements may be joint or sole. The impact of these arrangements on children largely depends on social and cultural factors of one or both parents (Steinbach et al., 2022). Statistics show that children tend to stay with a mother, which puts the primary responsibility on the mother to provide for the children (Steinbach et al., 2022). On the other hand, excluding a father may have psychosocial effects on both the father and the children (Steinbach et al., 2022). According to Steinbach et al., the involvement of both parents decreases the burden of a single-parent household. However, this may be less true if there is constant conflict between the two parties.

Families with Teenage Caregivers

U.S. teen birth rates have decreased since 1991 (CDC, 2021a), with 17.4 per 1,000 females in 2018 to 16.7 per 1,000 in 2019 (births per 1,000 females aged 15 to 19 years). More teenagers either abstain from sexual activity or use birth control. Regardless, the rates in the United States are higher than in other western, industrialized nations, and ethnic/racial disparities persist (CDC, 2021a). According to the CDC (2021a), in 2021, birth rates among Hispanic and non-Hispanic Black teens were two times higher than among non-Hispanic White teens. The birth rate of American Indian/Alaska Native teens was the highest among all racial/ethnic groups.

Nurses can support teen parents in various ways. The nurse should encourage and facilitate prenatal care by the client's obstetrical provider and subsequent contraceptive counseling and use after delivery. The nurse can provide anticipatory guidance on the child's growth and development and corresponding parenting skills. The nurse can work with the client to identify sources of social support and make relevant referrals for financial resources as needed. The nurse should support and encourage the teen father or partner to be involved if able. Finally, the nurse can counsel the client on the importance of completing high school and identify resources that can support the client in this goal.

Unmarried Couples

Cohabitation, or an unmarried couple that shares a residence, has increased significantly in the United States; in the 1970s, fewer than 1 million couples cohabited, compared to 8 million in 2017 (Seltzer, 2019). More couples live together and are in long-term relationships without getting married than in the past. Seltzer (2019) writes that cohabiting unions are more common among women with less than a high school education. In some states, nonmarried couples may not be eligible for joint health care benefits. These individuals may face more barriers to accessing health care due to a lack of health insurance coverage. Community nurses can help connect these families to community clinics or reduced-priced clinics.

Foster Families

In foster families, caregivers take care of children who are not related to them biologically, either short-term, long-term, or during a crisis. Foster families may need extra support and understanding from nurses. Although foster parents are responsible for providing care, the state has legal responsibility for the children. This can cause confusion in legal matters such as who signs health care consent forms and who makes final health care decisions. Nurses working with foster families can assist them with navigating the health care system.

LGBTQIA+ Families

LGBTQIA+ families represent another family demographic. In 2021, there were about 1.2 million same-sex couple households in the United States (U.S. Census Bureau, 2022c). This same survey completed by the U.S. Census Bureau (2022c, 2022b) found the following statistics:

- 710,000 of these same-sex couples were married, and 500,000 were unmarried.
- Among same-sex couples, 31.6 percent were interracial couples, compared with 18.4 percent of opposite-sex married couples.
- Same-sex unmarried couples had higher education rates where both held at least a bachelor's degree (29.6 percent) compared to opposite-sex (18.1 percent) unmarried couples.
- In the United States, 0.5 percent of children live in a household with adults who are in a same-sex relationship.
- Children in these households are more likely to be non-Hispanic Black than children living with adults who are in an opposite-sex relationship.
- Marriage status of same-sex households differs between male/male (8 out of 10 have a married father) and female/female (7 out of 10 have a married mother).

Nurses working with LGBTQIA+ families should work to provide gender-affirming, family-centered interventions to help these families meet their health-related needs (Medina-Martinez et al., 2021).

Multiracial Families

Between 2010 and 2020, the number of people in the United States who identify as multiracial has increased by 276 percent (Roy et al., 2022). Multiracial families may combine two cultures, two religions, or different traditions/beliefs. The most unique challenges for multiracial couples/families may develop during critical life changes, such as the transition to parenthood (Roy et al., 2022). Multiracial families may experience challenges when a child is born. For example, a child in an interracial family may struggle to develop their identity. They may feel pressure from friends or other family members to identify with one race or the other. Yet, studies have shown that multiracial families show more resilience and may also have more positive health outcomes than monoracial families (Roy et al., 2022). Nursing interventions for these clients should be inclusive and incorporate all of the family's relevant racial and cultural characteristics.

Functions of a Family

A family unit provides socialization, emotional support, and practical (economic) support, and it meets both societal and individual needs. The family socializes and develops members of the society within its family unit. Parents and caregivers influence children's social growth to help them acquire socially acceptable behaviors, learn self-reliance, and develop skills they will need for adulthood (Martinez-Escudero et al., 2020). Families share values that give members a perspective on how to view the world and their situation. Values give hope and meaning to a family and can guide their actions during difficult times (Gronewald, 2013).

As Maslow's hierarchy of needs suggests, family is an integral part of meeting an individual's needs ([Figure 28.2](#)) (McLeod, 2023). According to Maslow's hierarchy, one cannot achieve self-actualization if they do not have or have not met the other more basic needs. Families usually help meet basic human needs for their members. For example, families provide food, shelter, and clothing. Families frequently work to meet safety needs. For example, parents and caregivers use child safety seats and keep household chemicals out of reach of children. Families spend time together and provide emotional support and connection to meet the individual's need for love and belonging. This includes friendship, intimacy, and sense of connection or belonging (McLeod, 2023). Esteem, the next need identified by Maslow, is the need for respect, self-esteem, status, recognition, strength, and freedom. One way families help an individual's self-esteem is to support members in educational activities that promote their growth and intellectual development. The last need is self-actualization, or one's desire to become the most that they can be. Families can help their members seek out new experiences and determine their life goals.

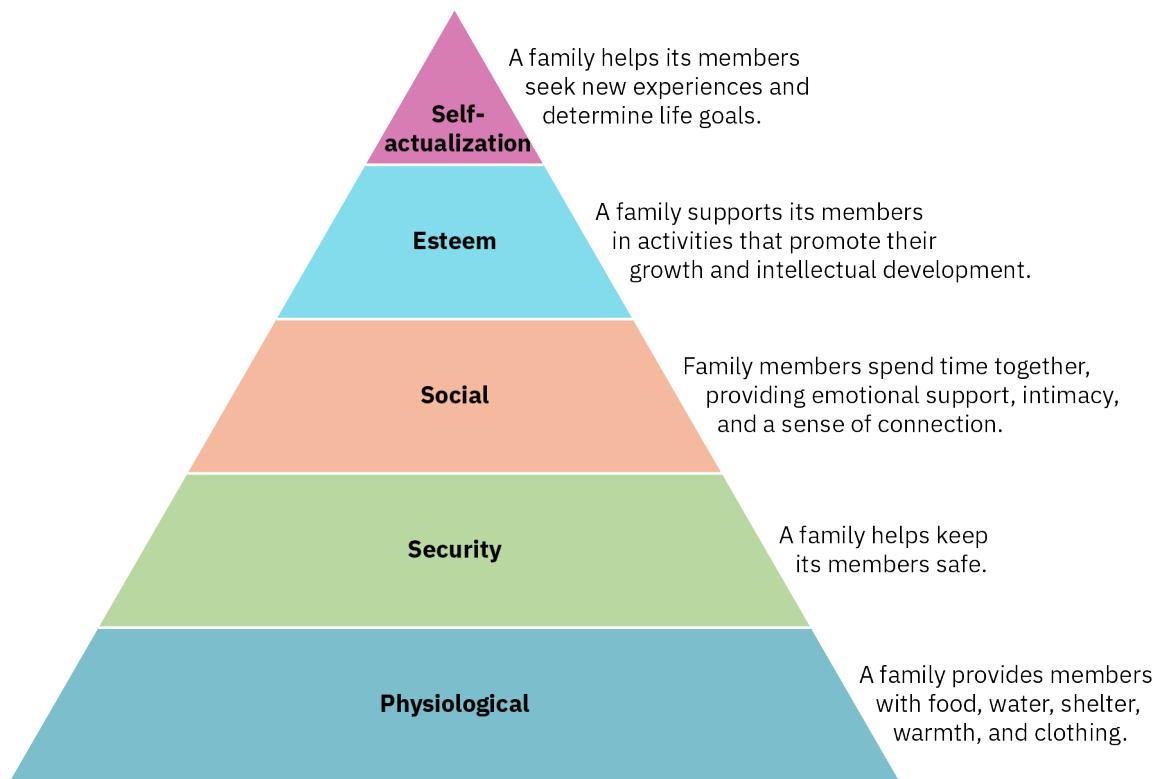

FIGURE 28.2 Maslow's hierarchy of needs can be applied to families. (attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

28.2 Frameworks of Practice

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 28.2.1 Describe how the socioecological framework applies to families.
- 28.2.2 Describe how the transactional model applies to families.
- 28.2.3 Explain how general systems theory offers insight into how families operate as social systems.
- 28.2.4 Discuss how the Calgary Family Assessment and Intervention Models can be utilized to assess family health.

Conceptual frameworks can help nurses understand and organize key concepts as they relate to an area of practice. Family nursing conceptual frameworks include the socioecological framework, the transactional model, general systems theory, the Calgary Family Assessment Model, and the Calgary Family Intervention Model.

Socioecological Framework

The social-ecological framework explores a range of social and environmental factors and intimate relationships that affect the family unit (Davidson et al., 2020). Social networks can include work relationships, school affiliations, religious affiliations, and connections to other community organizations. The environment includes neighborhoods, schools, and communities. This framework can help nurses better understand the relationships among the family, social networks, and the environment. See [Socio-Ecological Perspectives and Health](#) for a more detailed discussion.

The social-ecological framework can help community nurses provide health promotion and prevention to families ([Figure 28.3](#)). For example, a nurse working with a family to address alcohol abuse would implement interventions that target the individual, their relationships, their community, and society. At the individual level, the nurse would assess the person's risk for alcohol abuse and provide appropriate education for the client related to life skills and decision-making. At the relationship level, the nurse would assess the effects of relationships on the client's alcohol use and implement strategies to promote positive relationships with others to minimize or abstain from consuming alcohol. At the community level, the nurse would assess for factors that promote or facilitate alcohol use. Community interventions can include marketing campaigns promoting safe alcohol consumption and creating

opportunities for alternate activities. Finally, at the societal level, the nurse can assess laws and regulations relevant to alcohol use and lobby for policies that limit the negative effects of alcohol on society.

FIGURE 28.3 Providing nutrition education and information on where to obtain healthy food in the community is an example of using the social-ecological framework to promote health. (credit: U.S. Department of Agriculture/Flickr, Public Domain)

Transactional Model

The **transactional model** considers relationships between family members and between families and outside organizations as reciprocal. Members of the family both influence and are influenced by others. Within the family, nurses can use the transactional model to examine relations between caregiver's and children's behaviors (Cherry et al., 2019). For example, the child of a caregiver with a substance use disorder who sleeps a lot during the day may learn that they must get themselves ready for school independently at a young age. Conversely, that caregiver acclimates to the child's ability to manage their schooling and stops trying to be involved in the child's education.

As discussed previously, families go through different life cycles or stages. At each stage, the family will interact with institutions outside of the family. For example, as the child grows, the parents or caregivers will interact with different teachers, coaches, and mentors who have relationships with the child throughout their development. A community nurse can utilize the transactional model to see how the family "transacts," or interacts, with other people or groups. This observation can help the nurse understand whether the family can build healthy and meaningful relationships with people and organizations outside of the family.

General Systems Theory

The American Psychological Association (APA) (2023) describes **general systems theory** as an interdisciplinary conceptual framework that focuses on how individual entities or systems relate to and are organized with other systems. In other words, the individual is a system that exists within and among other systems that influence it. The family is considered a system comprised of various members whose thoughts, beliefs, and actions influence it. The family system is in turn influenced by other systems—including environmental systems, economic systems, educational systems, and so on. General systems theory helps nurses view families from a holistic perspective. Nursing care based on systems theory views the family as a unit in the context of the larger environment and seeks to effect change at the family level (Looman, 2019).

The family is a system with subsystems where family members tend to be connected by strong emotional bonds. For example, in families with two adult caregivers, the caregivers form a subsystem with a bond that differs from the bonds with any other individual in the family. The caregivers' relationship with their children is another subsystem or bond. Siblings, if present, also form a subsystem that is different from the bond they individually share with their

caregivers. Each of these levels or subsystems interacts within the whole system. Life events can affect these interactions and these subsystems. For example, when caregivers divorce and get remarried, these bonds change and alter the subsystems.

Systems theory can be useful to understand how families' health is affected by outside sources. A family's health is influenced by outside systems including the economic system and their environment. Accordingly, population health interventions recognize the interaction of these different systems to influence health. Healthy People 2030, the United States' plan for public health promotion, sets health-related goals and objectives for families and communities—not just for individuals (Office of Disease Prevention and Health Promotion [ODPHP], n.d.). For example, some of Healthy People's objectives relate to housing, homes, workplace, transportation, and other community needs that directly affect or influence families in those communities (ODPHP, n.d.).

Calgary Family Assessment and Calgary Family Intervention Models

Nurses use the Calgary Family Assessment Model (CAFAM) and the Calgary Family Intervention Model (CFIM) to promote family health and functioning and address family illness concerns (Zimansky et al., 2020). These models were developed from clinical work and are readily applicable to nursing practice (Leahy & Wright, 2016). The **Calgary Family Assessment Model** studies a family's structure, development, and function to assess its strengths, resources, problems, and illness (Zimansky et al., 2020). The assessment incorporates targeted questions as well as a genogram and ecomap to assess the family's interactions within the environment. Genograms and ecomaps will be discussed later in this chapter.

The **Calgary Family Intervention Model**, derived from the CFAM, provides a framework for nurses to use in therapeutic conversations that target the family's functioning as a system (Zimansky et al., 2020). The framework is based on three domains of family function: cognitive, behavioral, and affective (Mileski et al., 2022). Effective interventions incorporate all three domains. Nurses explain rationales (cognitive domain) when teaching new activities that lead to behavior change (behavioral domain). Families who implement the behavior change incorporate it into their family functioning (affective domain). For example, a nurse working with a family to develop healthier eating habits to decrease the family's risk of diabetes can explain the benefits of eating fewer fast-food meals and incorporating more home-cooked meals into their week. Along with explaining the nutritional benefits, the nurse can work with the family to identify behavior changes that will allow them to meet this goal, like creating a schedule of favorite home-prepared dinners the family can use as a weekly menu plan. If this is successful, the family implements this suggestion and realizes a positive emotional benefit to their family, which can help reinforce the behavior. Perhaps the family realizes they enjoy picking out their favorite meals and preparing them together.

Leahy and Wright proposed a 15-minute family interview based on the CFAM and CFIM that nurses can use in various settings with time constraints (Wright & Leahy, 1999). They identify five parts of an effective interview: manners, therapeutic conversations, family genograms and ecomaps, therapeutic questions, and commending family and individual strengths.

THEORY IN ACTION

Family Systems Theory and Family Sub-Systems

[Access multimedia content \(<https://openstax.org/books/population-health/pages/28-2-frameworks-of-practice>\)](https://openstax.org/books/population-health/pages/28-2-frameworks-of-practice)

In this video, Dr. Elizabeth Dorrance Hall discusses the systems theory and how it relates to the family.

Watch the video, and then respond to the following questions.

1. What are some of the subsystems in your family? How do they interact with and relate to one another?
2. How can systems theory guide nurses who provide care to families?

28.3 Family Health Nursing

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 28.3.1 Examine how family health affects individual health.
- 28.3.2 Identify health-promoting characteristics of families.
- 28.3.3 Educate families regarding self-care for health promotion, illness prevention, and illness management.
- 28.3.4 Explore the role of a community nurse during a home visit.

Family nursing involves caring for the family as “one client” in the community. Within this specialty, the nurse’s focus moves away from caring for one individual as a client to caring for one unit or group of people as a client. Family health nurses may work in various settings, such as in home care, local government, or hospitals. Family health nurses may work for organizations that focus on family health including the National Partnership for Women and Families (2023), which works to improve the lives of families by achieving equality for all women, or Families USA (2023), which advocates for high-quality, affordable health care for everyone.

Working with families is complex but rewarding. Nurses provide families with support and education to achieve desired outcomes. Family health nursing is an integral part of health care delivery. The International Family Nursing Association (IFNA) works to build a community of nurses and other health care professionals focused on improving families’ health worldwide (IFNA, 2023). Its goal is to transform family health by uniting family nurses across the globe to facilitate networking and knowledge sharing and to provide family nursing leadership through scholarship and research. Recent work by its members includes research on the effects of caregiver-clinician communication on health outcomes and managing family caregiver burden for clients with chronic disease.

Family Health Affects Individual Health

Family health reflects the family’s ability to meet each of the individual family members’ needs. Families are expected to help individuals meet their most basic needs for survival, as well as their psychological, spiritual, safety, economic, emotional, and intellectual needs. Many external factors influence the health and well-being of families. Economic stability, access to quality health care and education, safe neighborhoods, and social connections are all conditions that affect families’ ability to function. See [Social Determinants Affecting Health Outcomes](#) for more information on how social determinants affect individual and family health.

Characteristics of Healthy Families

Families can positively or negatively influence one’s health. From a physical perspective, some health conditions are inherited or have risk factors that can be passed from one generation to another. From a social perspective, family relationships become more important as individuals age and may need more assistance with managing health issues. Social support and social connectedness, which can be found in families, positively influence health (CDC, 2023). Marriage is associated with better health and increased likelihood of couples practicing healthy behaviors (Guner et al., 2018). Happily married individuals are healthier and live longer than those who never married or are divorced or widowed, while unhappily married individuals experience fewer benefits and could be considered a vulnerable population (Lawrence et al., 2018).

Researchers who study families have identified characteristics that can reflect the strength and health of a family (Clark-Jones, 2018):

- Affection—Strong families show affection or appreciation among members, keep promises to one another, and help others in the family.
- Commitment—Family members who demonstrate loyalty to the family and one another, trust one another, make decisions together, and share responsibilities have strong family ties.
- Positive communication—Family members who communicate regularly and openly in a supportive manner strengthen the family unit.
- Strong coping skills—Strong families are resilient and able to respond effectively to adverse situations.
- Healthy spiritual well-being—Families with strong connections are easily able to share values and beliefs and maintain an overall positive attitude.

- Spending time together—Families who enjoy common interests together including spontaneous activities enjoy a strong family connection.

When working with families, nurses should assess which family attributes can support the families' health goals. Michaelson et al. (2021) found that family stability and positive parent relationships were health-promoting, while interparental conflict and having an unsupportive family were health-threatening characteristics. Other positive characteristics include having healthy intra-family relationships and communication and encouraging healthy behaviors. The researchers recognized the importance of social determinants of health, specifically socioeconomic background and education. They acknowledged that the research they reviewed incorporated more diverse families than in the past and focused more on how the family functioned instead of what the family looked like. Finally, they concluded children are more likely to be portrayed as passive recipients of health-related behaviors than as active participants in managing their own health.

THEORY IN ACTION

What If Our Health Care System Kept Us Healthy?

[Access multimedia content \(<https://openstax.org/books/population-health/pages/28-3-family-health-nursing>\)](https://openstax.org/books/population-health/pages/28-3-family-health-nursing)

In this TED-Ed Talk, Rebecca Onie, cofounder of The Health Initiative (THI), a national campaign to catalyze a new conversation about and increased investments in health, including access to healthy food, safe and affordable housing, and well-paying jobs, highlights how basic needs such as heating, food, and safe housing affect the overall health of families.

Watch the video, and then respond to the following questions.

1. How might housing, food, and other environmental factors affect a family's health?
2. How can nurses use this knowledge to help provide housing, food, and heat for families?

HEALTHY PEOPLE 2030

Reduce the Proportion of Families That Spend More Than 30 Percent of Income on Housing

A goal of Healthy People 2030 is to expand policies that make housing more affordable to [help reduce the proportion of families \(<https://openstax.org/r/healthypeopled>\)](https://openstax.org/r/healthypeopled) that spend more than 30 percent of their income on housing. When families must spend a large part of their income on housing, they may not have enough money to pay for things like healthy food or health care. Studies have linked this dilemma to increased stress, mental health problems, and an increased risk of disease.

Family and Health Promotion

Community and public health nurses are important providers of health promotion interventions. As discussed in [Health Promotion and Disease Prevention Strategies](#), health promotion is the process of empowering people to increase control over, and to improve, their health (World Health Organization [WHO], 1986). The Health Belief Model (HBM), explored in further detail in [Health Promotion and Disease Prevention Strategies](#), is a framework nurses can use to help clients recognize their need to modify their health-related behaviors. It is not enough for nurses to provide health-related education to clients. They need to work with clients to get them to take steps toward improving their health.

Nurses should take a collaborative approach when educating families to help them understand and navigate health issues (Barnes et al., 2020). Nurses can help them improve their decision-making abilities and connect them with community resources including other families that could serve as mentors. Nurses provide education on diseases and disorders, medications, therapies, and a variety of other topics. Incorporating appropriate health promotion strategies into this instruction when working with clients can be beneficial ([Figure 28.4](#)). Nurses can work to strengthen the family's ability to model positive health practices. This will help children adopt healthy habits and carry that forward through their adult lives (Barnes et al., 2020).

FIGURE 28.4 Nurses provide health education and prevention strategies to families in community settings such as community health fairs. (credit: “6th Annual Allies in Health Community & Patient Fair - Wednesday 29 Oct 2014 (Community Engagement Network, VCH stall)” by Brianne Nettelfield/Centre for Teaching, Learning and Technology/Flickr, CC BY 2.0)

Education on health promotion, illness prevention, and illness management can occur in various settings—hospitals, clinics, other community locations, or through home visits. Educating families can be challenging, frequently requiring the nurse to accommodate a variety of ages and abilities. An assessment of the clients’ baseline knowledge and any barriers to learning is essential. For a more detailed discussion on health literacy, see [Assessment, Analysis, and Diagnosis](#). To learn more about developing an education plan, go to [Planning Community Health Education](#).

Regardless of the setting, the family is key to health promotion (Michaelson et al., 2021). There are four levels of health promotion. The aim of health promotion at the population (family) level is to improve health inequities and overall quality of life and to ensure access to health care (Mesariri et al., 2022). [Table 28.3](#) describes the different levels of health promotion in which the community health nurse is involved.

Health Promotion Level	Goal	Examples of Interventions
Primordial Prevention	Improve social and environmental conditions to reduce a population’s risk factors for disease	Offer sports and recreation activities to promote physical activity, which will in turn decrease the risk of obesity and other conditions
Primary Prevention	Implement measures to prevent disease development	Administer COVID-19 and flu vaccines during immunization clinics
Secondary Prevention	Screen for early disease detection	Hold a blood pressure screening to identify individuals with hypertension
Tertiary Prevention	Provide interventions to reduce the severity of disease and associated sequelae	Conduct home visits with clients recently discharged from the hospital

TABLE 28.3 Community Health Nurses’ Interventions Targeting Different Levels of Health Promotion (See Kisling & Das, 2023.)

Role of the Community Health Nurse Conducting Home Visits

Home nursing involves providing care in the client's home rather than in a health care setting. Home health visits can be challenging as the nurse is working alone in a home environment rather than a facility. They must have a variety of expertise to deal with complex situations and must work in unpredictable conditions (Brenne et al., 2022). Nurses conducting home visits may face health and safety hazards. They may encounter bloodborne pathogens and ergonomic hazards while moving and lifting clients. Additionally, nurses making home visits may face violence, hostile animals, unhygienic and dangerous conditions, and risks associated with driving from home to home (Occupational Safety and Health Administration, n.d.). Nurses making home health visits need to remain vigilant of their surroundings and recognize potential safety concerns. OSHA has compiled resources for identifying and preventing hazards in home health care; visit [Home Healthcare \(<https://openstax.org/r/oshagovh>\)](https://openstax.org/r/oshagovh) to learn more about recognizing and addressing the risks associated with home visits.

When preparing for the visit, the nurse should review the client's information and create a plan. Nurses typically make multiple visits during the day, so they must make the most effective use of the short time they spend at each house. Visits consist of an admission visit, usually within 48 hours of discharge from a health care facility, regular visits at prescribed intervals, and a discharge visit. Each visit must have an identified intervention that only a nurse is qualified to perform. Nurses should ensure they take all necessary supplies and understand the directions to the home. Once at the home, the nurse should survey for potential hazards before entering. Nurses should always carry a cell phone and make sure their organization knows their location throughout the day.

During the visit, the nurse will be in the unique position of being able to assess the client's home environment. Nurses caring for clients in health care facilities do not have this opportunity, which makes it harder for them to identify factors that can promote or hinder the client's health and recovery. Next, the nurse will perform the interventions for the visit including education, medication or treatment administration, and wound care. Finally, they will conclude the visit and schedule the next one based on the prescribed frequency and client need or discharge the client. Documentation must be completed either during the visit or soon after.

28.4 Conducting a Family Nursing Assessment

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 28.4.1 Differentiate between a genogram and an ecomap.
- 28.4.2 Develop an ecomap.
- 28.4.3 Construct a genogram.
- 28.4.4 Apply the nursing process to gain a holistic perspective of the family and formulate a nursing plan of care.

Community nurses working with families perform family assessments to help guide health promotion, illness prevention, and illness management strategies. This section introduces tools nurses may use during a family assessment and then applies the nursing process to an assessment of a family.

Genograms and Ecomaps

Genograms and **ecomaps** are two tools a nurse may use during an assessment to establish a nursing care plan and gain a holistic perspective on the family and their needs. Both are visual depictions of families with lines drawn to show connections and relationships among members (genogram) and between families and their social network (ecomap). These tools can help the community nurse gain a better understanding of various relationships between the family members and the community.

Tobias (2018) defines a genogram as a diagram showing birth and marriage relationships among family members, typically over at least three generations. In addition to showing the genealogical makeup of the family, a genogram may include additional health-related information. For example, lines that depict the status of emotional connections among individuals can be added to reflect family dynamics. Health conditions present among family members are shown using colored shading. This can help the nurse identify health conditions present in a client's family. Nurses can use this tool to educate family members regarding their risks for certain disorders and diseases. [Figure 28.5](#) provides an example of a genogram.

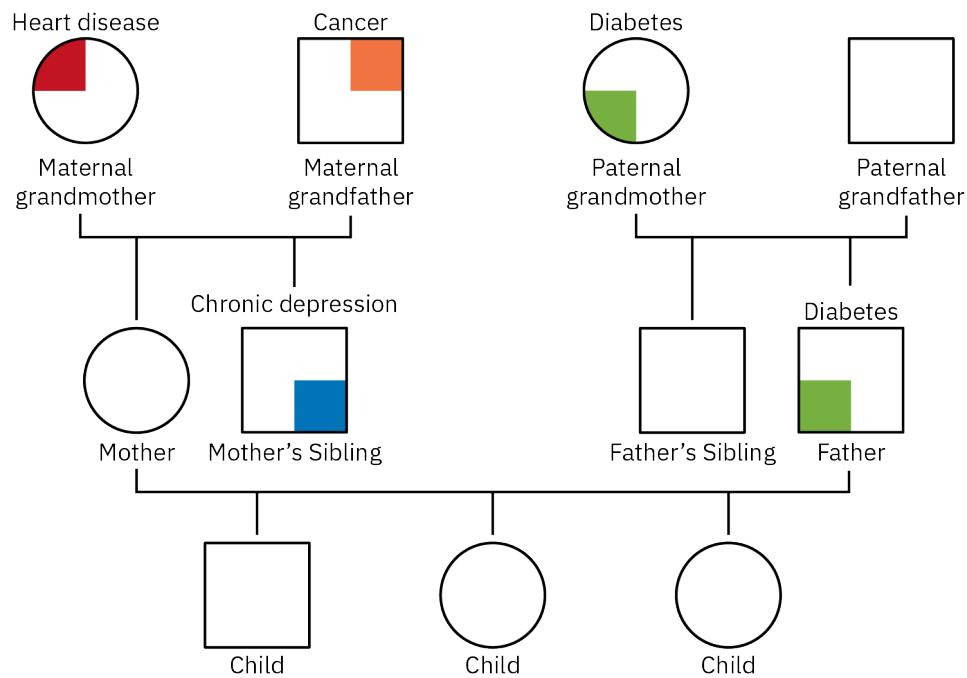

FIGURE 28.5 A family genogram shows birth and marriage ties. Shaded areas indicate health conditions present in family members.
(attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

An ecomap, also known as an ecological map, is a visual assessment tool that illustrates the relationships between the family and its social network. The ecomap can identify sources of stress and support for the family (Kuhn et al., 2018). The ecomap helps nurses and other health care providers to identify areas of conflict and potential challenges within a family and can depict affiliations, such as where family members work, ties to religious communities, community-based organizations, social support resources, health care access, school options, and ties to friends in the community. Nurses use ecomaps to identify areas that negatively or positively affect an individual or family. For example, is the family connected to a religious organization? If so, that can be a source of support for the family. Nurses can use this tool when working with families of children with disabilities. They can target intervention needs for these families by connecting them to community resources such as respite care, food pantries, community activities for children with autism, support groups, and programs specific to their needs. [Figure 28.6](#) shows an example of an ecomap.

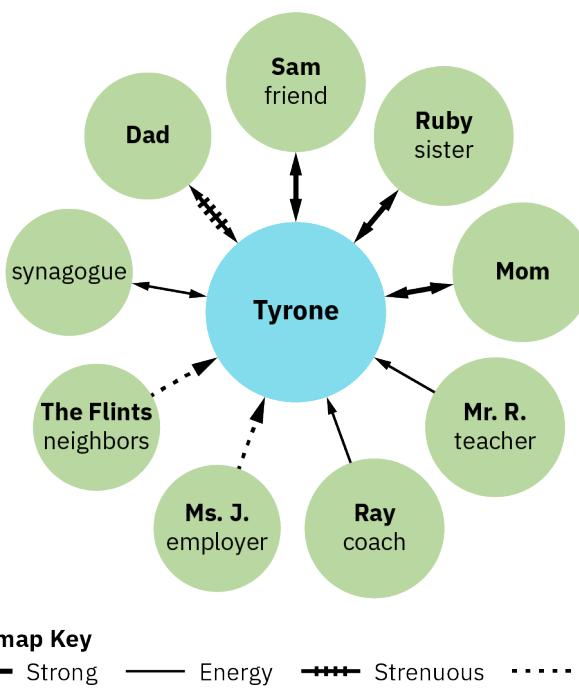

FIGURE 28.6 A family ecomap depicts the family's relationship to the community and resources. (attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

HOW TO MAKE AN ECOMAP

Access multimedia content (<https://openstax.org/books/population-health/pages/28-4-conducting-a-family-nursing-assessment>)

This video shows how to construct an ecomap.

Watch the video, and then respond to the following questions.

1. What is the goal of an ecomap?
2. How can ecomaps help nurses provide care to families?

Family Assessment

A **family health assessment** is a systemized process of collecting and organizing data. Nurses perform these assessments to determine a family's strengths and areas of concern. Nurses gather information through interviews with the family and observation of the family's environment and by collecting community data. As mentioned, the nurse may use a genogram and ecomap as part of the family assessment.

Interviewing the family is an essential part of gathering data. During this conversation, family members can discuss personal family information, such as where they work or attend school and their individual health status, both physical and mental (Broekema et al., 2020). This is also a time when the family may voice their concerns or needs. It may take more than one interview to collect the necessary data. The nurse can then assess the family continuously as data are obtained. Once the nurse conducts the family health assessment, they must formulate a nursing care plan. The nursing care plan consists of the assessment, diagnosis, planning, and evaluation.

To illustrate the family nursing care plan process, let's return to Dianah, the community health nurse employed by the district health department introduced at the beginning of this chapter. Dianah has received a referral from one of the schools in the district with concerns regarding a student (Sophia) missing too many days of school. The school counselor questioned Sophia and is concerned because Sophia was just diagnosed with asthma. With this concern, Dianah plans to go to the home and assess the student and family.

Assessment

During the assessment stage, the nurse gathers data about the family. The neighborhood and community resources

can be assessed before the home visit.

To prepare for her visit to Sophia's home, Dianah obtains her address and does some preliminary research about her neighborhood. The school and home are located within the city limits, with over 75 percent of families at or near the federal poverty limit. This area is ethnically diverse, and approximately 50 percent of families speak English as a second language. Dianah arrives at Sophia's home and notices that it needs external repairs. Inside, the home has very few furnishings, but it is relatively clean. Sophia's mom (Ana) greets Dianah with a smile and a handshake. She appears to be anxious. To decrease Ana's anxiety, Dianah states that she is there to help Ana and Sophia.

Dianah starts the assessment by explaining the purpose of her visit: the school is concerned with Dianah's absenteeism and her recent diagnosis of asthma. She asks Ana if she has any concerns. Ana says Sophia has had several visits to the emergency department (ED) for asthma attacks. Sophia has an inhaler she is supposed to use during an asthma attack but does not always carry it with her. Sophia's pediatrician prescribed some medications that are supposed to minimize the frequency of asthma attacks, but they are very expensive.

After hearing Ana's primary concerns about Sophia's asthma, Dianah questions the family further. Sophia reports she loves going to school. Ana reports Sophia has been missing school because of her asthma and because her work schedule sometimes makes it hard to get Sophia to school. The school is too close for the school bus to pick Sophia up, but the neighborhood is not safe for Sophia to walk to school by herself. Ana emphasizes her concern for her daughter's safety, explaining that there was a recent shooting several blocks away, near the school.

Ana requires two jobs to meet the family's needs, and their rent keeps increasing. Additionally, she worries about losing her jobs. Through her primary job she gets health insurance, which is very expensive. Ana has been unable to pay all the bills associated with Sophia's ED visits and medications, and she frequently runs out of money for food. Ana states that she is exhausted. She feels alone and has no friends to talk to. Dianah considers this information and recognizes that multiple factors in addition to her recent asthma diagnosis contribute to Sophia's absenteeism. Asking more questions to assess the family's background, Dianah learns that Ana was incarcerated for drug use several years ago and has since successfully completed rehab, attained a job, and regained custody of Sophia. She is worried about losing custody of Sophia again if she is unable to provide for her.

Dianah completes a health history and physical assessment of Sophia. Next, Dianah creates an ecomap describing the family's relationships with others. It appears they have no other family members living nearby. They want to attend the local church, but Ana's work schedule has made attending church and forming outside friendships difficult. Throughout the interview process, Dianah asks Ana and Sophia about their needs and what resources may help their situation. They answer that they are unsure since they do not know what is available to them.

Analysis

After the assessment, the nurse analyzes the data gathered. The nurse can identify and prioritize the family's needs based on this analysis. Nurses in other settings frequently must address individual physiological needs. In community settings, nurses identify and address the family unit's needs.

Dianah analyzes all the information and recognizes some patterns. First, Sophia is experiencing acute exacerbations of a chronic health condition. There appear to be opportunities to decrease the frequency and severity of her acute asthma attacks if she can consistently obtain and use her prescribed medications. This will help reduce Sophia's absenteeism rate. Additionally, obtaining reliable transportation for Sophia to attend school is another priority. The family's environment—living in a neighborhood that experiences violence and their limited income—hinders their ability to meet their health goals. Ana does not appear to know what community resources are available to meet her food and housing needs. Additionally, she does not appear to have any social support. Based on this analysis, the nurse works with Ana and Sophia to prioritize the following needs:

- Sophia needs consistent access to her medications and regular follow-up for her asthma.
- Sophia needs a safe mode of transportation to and from school.
- They both need access to affordable, nutritious food.
- They both need access to affordable housing in a safe neighborhood.
- They may benefit from additional community support.

Planning and Implementation

After the analysis, the next stages are planning and implementation. During the planning stage, the nurse and the

family set realistic goals and identify feasible interventions. During the implementation phase, the nurse carries out the plan that was developed collaboratively with the client.

By the end of the month, Dianah, Ana, and Sophia agree they would like to see the following outcomes achieved:

- Sophia will experience fewer trips to the ED for asthma attacks.
- Sophia will take her medications consistently as prescribed.
- Sophia will have fewer missed days at school.
- Ana will have met with the social worker and submitted applications for applicable assistance programs for which she is eligible.
- Ana will have connected with the local support group for single parents.
- They both will have attended at least one church activity or connected with another family at the church.

Based on these goals, Dianah works with Ana and Sophia to develop the action steps they can take:

- Dianah will educate Ana and Sophia on Sophia's recent diagnosis and new medications.
- Dianah will work with the family and the school to develop a feasible transportation plan for Sophia.
- Dianah will arrange for a visit with a social worker who can help them apply for Medicaid or other assistance with medical costs and apply for supplemental food programs and affordable housing in a safer neighborhood.
- Dianah will connect Ana to a local support group for single parents.
- Dianah will help them reach out to their church to identify ways to become more involved and supported by the church family.

Together they set a schedule for weekly follow-up visits for the next month to monitor their progress as these interventions are implemented.

Evaluation

Evaluation is the last step in the family assessment. However, when working with families, this process is typically more cyclical than linear. During the evaluation, the nurse reviews the family's progress. Sometimes, when progress or needs are not met, the interventions may be modified or changed altogether.

Each week Dianah visits, she evaluates Ana's and Sophia's progress.

- During the month, Sophia only had one ED visit for asthma.
- The social worker connected the family to resources for obtaining medications at a reduced cost, giving Sophia access to the necessary medications.
- Both feel that Dianah's instruction gave them a better understanding of asthma and how to manage it.
- Ana has connected with the social worker and has filled out the necessary paperwork for affordable housing and supplemental food program benefits.
- Ana went to the community support group and enjoyed meeting the other members, stating she didn't realize that other moms are struggling with the same things. She has several budding friendships within the support group and no longer feels that she is alone.
- The social worker connected Ana to the local employment office, where she was able to research new job opportunities. She is starting a new job next month. The job is in a safer neighborhood with subsidized housing near the middle school that Sophia will be attending next year. She hopes that her application will be processed soon and they can move to the new place before Sophia starts school.
- Sophia says she has not missed any school and feels much safer using the bus program.

Ana and Sophia are satisfied with their progress and are excited about their future. Dianah plans a follow-up visit in three months.

28.5 Family Violence

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 28.5.1 Distinguish between development and situational crises.
- 28.5.2 Describe the cycle of violence observed in intimate partner abuse.
- 28.5.3 Differentiate between neglect and abuse.
- 28.5.4 Identify strategies to identify abuse against children, pregnant and postpartum clients, and older adults to improve outcomes and safety.
- 28.5.5 Explain the nurse's role in abuse and neglect prevention.

A crisis occurs when two or more issues coincide (Early Childhood Learning and Knowledge Center, 2022). Families may go through different types of crises, and the magnitude of a crisis depends on the family's ability to function and the environment of the crisis. A stressful situation becomes a crisis when a family lacks resources or support and/or necessary coping skills. A crisis may be developmental or situational. A **developmental crisis** results from predictable change and is due to the normal growth and development changes that occur within a family, such as adolescence. **Situational crises** are typically events that are out of a person's control, such as a natural disaster or a family death. Crises can promote growth; they can leave a family even stronger and more resilient. Alternatively, crises can negatively affect families and create a crisis reaction. How families deal with these crises is directly connected to their access to social networks and their cultural backgrounds (Bray, 2022). It is pertinent that community nurses assess the family's access to these support networks because they can be key players in connecting families with various resources during a crisis.

Cycle of Violence: Intimate Partner Violence

Intimate partner violence (IPV) is abuse that is caused by someone who is or has been romantically involved with the victim to some degree. The abuser could be a current or former spouse and/or a dating partner (CDC, 2022b). The abuse can be a one-time occurrence or occur multiple times over years. IPV can include any of the following types of violence (CDC, 2022b):

- Physical/contact violence: using a physical form of violence that includes hitting, kicking, or any other type of physical force
- Sexual violence: forcing or attempting to force a partner into a sex act, touching, or a nonphysical sexual event (e.g., sexting) without the other's consent
- Stalking: a pattern of unwanted attention that causes fear
- Psychological aggression: use of verbal and nonverbal communication with the intent to harm

IPV is common, affecting millions of people in the United States every year (CDC, 2022b). According to the data from the CDC's National Intimate Partner and Sexual Violence Survey (NISVS), about 41 percent of women and 26 percent of men have experienced physical/contact, sexual violence, and/or any form of IPV (CDC, 2022b). Furthermore, this data shows 61 million women and 53 million men have experienced psychological aggression as a form of IPV in their lifetime. In a small number of cases, IPV can lead to homicide (Messing, 2019).

Pregnant clients are at an increased risk for IPV during pregnancy and the postpartum period (Hasselle et al., 2020). Negative health consequences of IPV during pregnancy can lead to fetal health problems, labor and delivery complications, and negative long-term developmental outcomes for the child. The American College of Obstetricians and Gynecologists (ACOG) recommends that all women be assessed for IPV during prenatal visits (Huecker et al., 2023). Domestic violence is more common in pregnant women than gestational diabetes and preeclampsia.

IPV typically follows a predictable cycle ([Figure 28.7](#)) that involves tension building, a violent incident, and a honeymoon phase (World Bank Group Family Network, 2023). During the first phase, the victim is usually in denial and believes they have more control over the incident than they do, while the abuser recognizes their behavior is wrong and fears the victim will leave. The second phase involves violence and can be dangerous for others who try to interfere, although it is important for the victim to have a safe place to retreat to. The victim is most likely to seek help in the third phase; however, many victims do not recognize that the third phase is temporary, and the cycle will repeat.

FIGURE 28.7 The cycle of intimate partner violence has three phases. (See World Bank Group Family Network, 2023; attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

IPV is recurrent at the individual level and can continue across generations. Individuals who have experienced IPV in their childhood or teen years are more likely to continue to experience it in adulthood (CDC, 2022b). Children in families where IPV is prevalent are more likely to experience it themselves or become perpetrators in the future. The consequences of IPV are profound. These include depression, post-traumatic stress disorder (PTSD), heart problems, musculoskeletal problems, reproductive disorders, many of which are chronic conditions, and in some cases death by homicide as one in five homicide victims are killed by an intimate partner (CDC, 2022b). The financial cost of IPV to society is estimated at \$3.6 trillion (CDC, 2022b). This includes medical services, lost work time, criminal justice costs, and other costs. The CDC (2022b) provides [resources and tools \(<https://openstax.org/r/violencepreventiona>\)](https://openstax.org/r/violencepreventiona) to stop or prevent IPV (Table 28.4). Nurses can use and teach these strategies to clients.

Teach safe and healthy relationships	<ul style="list-style-type: none"> Social-emotional learning programs for youth Healthy relationship programs for couples
Engage influential adults and peers	<ul style="list-style-type: none"> Men and boys as allies in prevention Bystander empowerment and education Family-based programs
Disrupt the developmental pathways toward partner violence	<ul style="list-style-type: none"> Early childhood home visitation Preschool enrichment with family engagement Parenting skill and family relationship programs Treatment for at-risk children, youth, and families
Create protective environments	<ul style="list-style-type: none"> Improve school climate and safety Improve organizational policies and workplace climate Modify the physical and social environments of neighborhoods

Support survivors to increase safety and lessen harms	<ul style="list-style-type: none"> Victim-centered services Housing programs First responder and civil legal protections Patient-centered approaches Treatment and support for survivors of IPV, including teen dating violence

TABLE 28.4 CDC Strategies for Addressing and Preventing IPV (See CDC, 2022b.)

CDC: IPV STATISTICS AND PREVENTION STRATEGIES

[Access multimedia content \(<https://openstax.org/books/population-health/pages/28-5-family-violence>\)](https://openstax.org/books/population-health/pages/28-5-family-violence)

This video describes the prevalence of IPV and offers prevention strategies.

Watch the video, and then respond to the following questions.

1. Why is it important for community nurses to be aware of the statistics of IPV?
2. What are some prevention strategies for IPV?

Community nurses are in a key position to assess families for IPV. These nurses have clinical knowledge or practitioner expertise they can apply to risk assessment. Nurses can choose from among 11 evidence-based risk assessment instruments when assessing families for IPV risk (Messing, 2019). These risk assessment tools are also used in other specialties, such as social services, and in criminal justice settings. When administering one of these tools, the nurse should make sure the client is alone and able to speak freely. If the assessment reveals the client is at risk, the nurse should be prepared to counsel the client on the available resources and next steps.

Neglect Versus Abuse

According to the CDC, one in seven children experience some form of child abuse or neglect. Children who live in poverty are five times more likely to experience neglect and abuse than children who do not (CDC, 2022a).

Neglect is the failure to meet the basic physical and emotional needs of children and vulnerable adults. Basic needs may include housing, food, clothing, education, access to medical care, and emotional validation (CDC, 2022a).

Abuse can be classified as physical, sexual, or emotional. **Physical abuse** is the use of physical force to cause physical injury (CDC, 2022a). For example, hitting, kicking, shaking, and burning are forms of physical abuse. **Sexual abuse** includes pressuring or forcing an individual to engage in sexual acts. This includes fondling, penetration, and/or exposing the individual to other sexual activities (CDC, 2022a). **Emotional abuse** is a behavior that harms the individual's self-worth or emotional well-being (CDC, 2022a). This may include name calling, shaming, rejecting, withholding love, manipulation, guilt tripping, and gas-lighting (undermining another person's perception of reality). While neglect and abuse occur frequently in the treatment of children, they can also occur with vulnerable adults. The federal government defines "vulnerable adult" as an individual age 18 or older who is unable to meet their own needs without assistance. This may be related to incapacity, mental illness, physical illness or disability, cognitive disability, advanced age, chronic use of drugs, chronic intoxication, and confinement (U.S. Department of Justice, n.d.). Though nurses may be wary of wrongfully accusing someone of child abuse or neglect, most states require nurses to report suspected cases. Nurses can play an important role in preventing abuse and neglect of children and vulnerable adults in their communities. [Table 28.5](#) depicts prevention strategies.

Strengthen economic supports to families	<ul style="list-style-type: none"> • Strengthen household financial security • Family-friendly work policies
Change social norms to support parents and positive parenting	<ul style="list-style-type: none"> • Public engagement and enhancement campaigns • Legislative approaches to reduce corporal punishment
Provide quality care and education early in life	<ul style="list-style-type: none"> • Preschool enrichment with family engagement • Improved quality of child care through licensing and accreditation
Enhance parenting skills to promote healthy child development	<ul style="list-style-type: none"> • Early childhood home visitation • Parenting skill and family relationship programs
Intervene to lessen harms and prevent future risk	<ul style="list-style-type: none"> • Enhanced primary care • Behavioral parent training programs • Treatment to lessen harms of abuse and neglect exposure • Treatment to prevent problem behavior and later involvement in violence

TABLE 28.5 CDC's Strategies to Prevent Child Abuse and Neglect (See CDC, 2022a.)

As introduced in [Health Promotion and Maintenance Across the Lifespan](#), elder abuse and neglect are defined as the intentional act or failure to act that causes harm or risk of harm in the adult who is age 60 or greater (CDC, 2021b). Some vulnerable adults are also at risk for abuse and neglect because of mental conditions or disabilities. Common types of abuse include physical, sexual, or emotional abuse or neglect. The abuser is typically someone the older adult knows and trusts, such as a family member, friend, or caregiver. Abuse may occur in the older adult's home or in an institutional setting, such as a long-term care facility or nursing home. An estimated one in ten U.S. adults experience some form of abuse or neglect (CDC, 2021b). According to the WHO, global rates of elder abuse in professional settings are high, with two out of three staff indicating they have committed some form of elder abuse (WHO, 2022). Risk factors for abuse and neglect in residential settings include staff burnout, lack of qualified staff, and stressful working conditions (CDC, 2020). The box below lists abuse prevention strategies.

CDC ELDER ABUSE PREVENTION STRATEGIES

- Listen to older adults and their caregivers to understand their challenges and provide support.
- Report abuse or suspected abuse to local adult protective services, long-term care ombudsman, or the police.
- Educate oneself and others about how to recognize and report elder abuse.
- Learn how the signs of elder abuse differ from the normal aging process.
- Check in on older adults who may have few friends and family members.
- Provide overburdened caregivers with support such as help from friends, family, or local relief care groups; adult day care programs; counseling; or outlets intended to promote emotional well-being.
- Encourage and assist people (either caregivers or older adults) having problems with drug or alcohol abuse in getting help.

(See CDC, 2021b.)

Identifying Abuse

Because abuse may be difficult to identify, a thorough history of present illness is necessary to make a correct diagnosis (Gonzalez et al., 2022). The community nurse must be able to identify different types of abuse and how they manifest in different age groups.

Identifying Abuse in Children

When working with children, the caregiver is the primary spokesperson. Getting a full history of events from the caregiver is one of the first screening steps. For example, when explaining the cause of a child's injury, the parent or caregiver should be able to easily give the history of the events. If the parent or caregiver stops to think or keeps changing the story, this should raise the suspicion of abuse and should be thoroughly investigated. Depending on the age and developmental status of the child, they may or may not be able to tell the nurse what happened. Some children are nonverbal, and others may be too frightened to say anything. In addition to the history of the present illness, a thorough medical history is needed. The nurse should assess for risk factors for abuse as well as medical conditions that can mimic signs of abuse, such as clotting or bleeding disorders, that would increase the chances of a child having explained bruising. Other relevant diagnoses include diseases that affect bone integrity, vitamin D deficiency, and genetic disorders that may increase the child's risk of fractures.

During the history, the nurse should observe the family's behavior. Does the child seem fearful? Do they avoid either parent or caregiver? How do the parent(s) or caregiver(s) act with the child? The nurse must thoroughly assess any injury. Signs and symptoms of possible physical abuse in children include the following:

- A nonambulatory infant with any injury
- Injury in a nonverbal child
- Injury inconsistent with child's physical abilities and a statement of harm from a verbal child
- Mechanism of injury not plausible or multiple injuries, particularly at varying ages
- Bruises on the torso, ear, or neck in a child younger than 4 years of age
- Burns to genitalia
- Stocking or glove distributions or patterns

- Caregiver being unconcerned about the injury
- An unexplained delay in seeking care or inconsistencies or discrepancies in the histories provided

The most common sign of physical abuse, bruising, is easy to miss since ambulatory children are prone to falling. Burns are also a common form of abuse and should be thoroughly assessed. Head, skeletal, and abdominal trauma must always be thoroughly assessed for abuse as these are common causes of mortality in children (Gonzalez et al., 2022). Nurses have a legal and moral obligation to identify and report child abuse. Most often, child abuse is first seen in the ER, and nurses are usually the first ones to notice it.

Identifying abuse among infants and toddlers can be challenging because they are nonverbal. The nurse must perform a thorough physical assessment and carefully question the parent or caregiver. The main difference when assessing for possible abuse in a school-age child or adolescent is that they are verbal and can tell you what happened during the event. Signs and symptoms, which may be the same, include unexplained bruising, burn marks, and/or nonspecific symptoms such as abdominal pain, anxiety, and generalized pain.

Evidence of abuse among adolescents and particularly teenagers can appear in a variety of ways. Clients in this age group who are victims of abuse are likely to develop eating disorders, dress younger/older than their age, struggle academically in school, experience depression, abuse substances, or run away (Stanford Medicine, 2023). When screening this age group for potential abuse, it is important to ensure the client understands that the nurse is required to report certain findings of abuse and may not be able to keep everything confidential.

Identifying Abuse in Pregnant or Postpartum Clients

Signs and symptoms of abuse in pregnant clients or postpartum clients may include injuries to the body, breasts, genitals, rectum, and buttocks (Huecker et al., 2023). Defensive injuries may be present on the forearms and hands. Additionally, these clients may exhibit nonspecific signs and symptoms, such as headaches, palpitations, chest pain, painful intercourse, chronic pain, and chronic fatigue. Psychological signs and symptoms may include anxiety and depression (Huecker et al., 2023). These clients may wear clothing to cover up the abuse and may make up reasons for their injuries. Since most clients who are pregnant receive prenatal care, community nurses can use this time to identify at-risk populations and prevent abuse by providing resources to these families.

HOW TO SPOT INTIMATE PARTNER VIOLENCE IN A MEDICAL SETTING

[Access multimedia content \(<https://openstax.org/books/population-health/pages/28-5-family-violence>\)](https://openstax.org/books/population-health/pages/28-5-family-violence)

This video from the Maryland Health Care Coalition Against Domestic Violence describes how health care providers can identify IPV.

Watch the video, and then respond to the following questions.

1. What are cues nurses should look for to identify IPV?
2. During what types of interactions in health care settings are nurses likely to observe signs of IPV?
3. If a nurse suspects IPV, what should the nurse do to address the situation?

Identifying Abuse in Older Adults

Identifying abuse in older adults can be difficult due to the declining cognitive and mental status of this population. Certain mental health disorders such as dementia, Alzheimer's disease, and traumatic brain injuries make effective communication difficult and these clients poor historians. This makes it difficult for the nurse to establish a sequence of events leading up to the injury. Behavioral manifestations of abuse in older adults may include agitation, inappropriate behavior, and losing bowel and/or bladder control (Lin, 2020). Minor signs or symptoms of abuse in older adults may include cuts, scratches, bruises, and welts. More serious signs or symptoms may include head injuries, broken bones, constant physical pain, soreness, and fatigue (CDC, 2021b). [Table 28.6](#) provides some tools for assessing abuse or IVP in vulnerable populations.

TABLE 28.6 Assessment Tools for Abuse or IVP in Adults, Children, and Vulnerable or Older Adults

Abuse and Neglect Prevention

As discussed in [Foundations of Public/Community Health](#), levels of prevention include primary, secondary, and tertiary. Nurses can implement strategies at all levels to help families in crisis and prevent abuse and neglect. However, nurses must carefully select feasible interventions that maintain client privacy and autonomy.

- Primary prevention strategy: strengthening household resources. Community nurses can strengthen household resources by connecting them to community resources such as SNAP benefits, health insurance, and affordable housing and educating them on healthy relationships, coping skills, and communication skills.
- Secondary prevention strategy: screening families at risk for crisis events. This includes utilizing resources/screening tools listed in [Table 28.6](#).
- Tertiary prevention strategy: preventing further risk or damage after an event. For example, if a woman and her children have experienced or are experiencing abuse, providing them with a safe shelter or housing.

CASE REFLECTION

Working with Client Families Who Are At Risk of Abuse or Neglect

Read the scenario, and then respond to the questions that follow.

Linda is a home health nurse who visits clients who have recently had babies. Linda partners with her local community services board to provide these families with resources; she also conducts risk assessments, such as screenings for postpartum depression and IPV.

Linda visits Elena in the suburban home Elena shares with her husband outside a major city. Elena recently delivered her first child. Elena is on maternity leave and has good benefits from her job as a marketing consultant for a major firm. She states that she is happy and feels good following the birth of her child.

Linda and Elena discuss the baby's feeding schedule, weight, and sleep. Linda asks about Elena's health—her sleep patterns, eating habits, and weight loss postpartum—and screens her for postpartum depression.

As they talk, Linda notices that Elena is wearing a long-sleeve sweater despite the room's warm temperature. She also notices bruises on Elena's face covered with makeup. Linda asks Elena if she is being hit, kicked, or slapped. She asks Elena if she feels safe in her home and if she is concerned for the baby's safety. Elena looks at her hands and says she is safe. She explains that the bruise on her face came from running into the door at night when getting up to feed the baby. Linda examines the baby thoroughly for any evidence of trauma or failure to thrive.

Linda shares with Elena that it is okay to ask for help and gives her IPV resources (hotline numbers) Elena can use if needed. Linda asks Elena if she can visit again in a couple of weeks. Elena agrees, and they schedule the next visit.

1. In this scenario, what subjective and objective cues are concerning for abuse?
 2. What risk factors for IPV does this client have?
 3. What steps should Linda take to ensure clients are in a safe environment?
 4. Why is it important for Linda to follow up with another visit?
-

Chapter Summary

28.1 Family as Client

Everyone has their own definition of family. Whatever that definition, the nurse must work with the family and their dynamics. Regardless of the structure, families share certain common functions and characteristics. The functions and characteristics of the family can and will affect the health of the individual. Nurses must educate families on self-care, health promotion, and disease prevention.

28.2 Frameworks of Practice

Families go through life cycles, from starting a family to growing old. Each family may go through certain developmental tasks at their own pace. Nurses need to differentiate these tasks to formulate a holistic perspective on the family. Certain frameworks and theories help guide nurses in caring for families and help nurses understand how these families operate as a social system. These include the socioecological framework, the transactional model, general systems theory, the Calgary Family Assessment model, and the Calgary Family Intervention model.

28.3 Family Health Nursing

In family health nursing, the nurse focuses on viewing the “client” as one unit or group of people. Family health nurses work in a variety of settings such as home care agencies; local, state, or national agencies or organization; or hospital systems. Family health

reflects the family’s ability to meet each family member’s physical, psychological, spiritual, safety, economic, emotional, and intellectual needs. A family’s ability to meet these needs is affected by the SDOH.

28.4 Conducting a Family Nursing Assessment

A family health assessment is a systemized process of collecting and organizing data nurses may use to determine a family’s strengths and areas of concern. Nurses gather information through interviews with the family and observation of the family’s environment and by collecting community data. Specific tools, including ecomaps and genograms, can help nurses conduct family assessments, and it may take more than one interview to collect the necessary data. Once the nurse conducts the family health assessment, they must formulate a nursing care plan that includes assessment, diagnosis, planning, and evaluation.

28.5 Family Violence

Families may experience developmental or situational crises. Families may also experience IPV, abuse, and/or neglect. Nurses must understand the different types of abuse (physical, sexual, or psychological) and their signs and symptoms. Nurses have an ethical role in preventing and intervening in any abuse. Nurses can implement strategies at all levels to help families that are in crisis and prevent abuse and neglect.

Key Terms

abuse physical, sexual, or emotional harm inflicted on others

Calgary Family Assessment Model (CFAM) model used to assess a family’s strengths, resources, problems, and illness suffering by studying the family’s structure, development, and function

Calgary Family Intervention Model model based on CFAM; provides a framework for nurses to use to have therapeutic conversations that target the family’s functioning as a system using three domains of family function: cognitive, behavioral, and affective

developmental crisis a crisis resulting from predictable change due to normal growth and development

Duvall’s Family Development Theory a theory of family development that asserts that families must move through certain stages, in order, and in each stage attain certain developmental tasks

ecomap visual assessment tool that illustrates the

relationships between a family and its social network

emotional abuse a behavior that harms a person’s self-worth or emotional well-being

family a group of two or more people (one of whom is the householder) related by birth, marriage, or adoption and residing together (including related subfamily members)

family group any two or more people (not necessarily including a householder) residing together and related by birth, marriage, or adoption

family health assessment a process of collecting data from family members and organizing this data

family household a group of two or more people (one of whom is the householder) related by birth, marriage, or adoption, including any unrelated people (unrelated subfamily members and/or secondary individuals) who may reside with them

family nursing a nursing discipline that involves caring for the family as one unit or group of people

family unit a household maintained by a householder who is in a family; includes any unrelated people (unrelated subfamily members and/or secondary individuals) who may reside together

general systems theory an interdisciplinary conceptual framework focusing on wholeness, patterns, relationship, hierarchical order, integration, and organization of phenomena

genogram a diagram that depicts family ties through birth and marriage

intimate partner violence (IPV) abuse that is caused by someone who is or has been romantically involved with the victim

neglect the failure to meet the basic physiological

and emotional needs of children and vulnerable adults

physical abuse the use of physical force to cause physical injury

sexual abuse pressuring or forcing a person to engage in sexual acts

situational crisis a crisis that can either be predictable, such as a divorce, or unpredictable, such as a natural disaster or family death

transactional model a family nursing model that looks at family processes and the family's relationships or its transactions with other institutions

Review Questions

1. The nurse is assessing a family that includes an adult and a school-aged child named Jackson. Which of the following questions should the nurse prioritize to ask the adult?
 - a. Do you have any concerns about your son's health?
 - b. What is your relationship to Jackson?
 - c. Is Jackson's other parent a source of support for you?
 - d. How many other children do you have?

2. The nurse observes the interaction between a father and his school-age child during which the father tells the child that he needs to "shut up and leave him alone." According to Maslow's hierarchy, which of the following needs are most likely threatened in this interaction?
 - a. Self-actualization
 - b. Esteem
 - c. Social
 - d. Security

3. According to general systems theory, which of the following events represents a change in a family's subsystem?
 - a. Two parents divorce.
 - b. One parent loses their job.
 - c. The family moves to another home.
 - d. The children start school.

4. A nurse is teaching family members how to read food labels. According to the Calgary Family Intervention Model, which of the following actions by the family incorporates all three functional domains?
 - a. The family groups the low-sodium foods together in the cabinets.
 - b. The family explains back to the nurse how to read a nutrition label.
 - c. The family practices reading labels at home to reinforce what they learned.
 - d. The family reads nutrition labels when shopping and selects low-sodium foods for their meals.

5. The nurse is working with a group of older adult couples to help them learn more about fall prevention and how to make modifications in their home to decrease their risk of falls. This is an example of which level of health promotion?
 - a. Primary
 - b. Secondary
 - c. Tertiary
 - d. Primordial

6. Which of the following actions by a home health nurse can decrease the risk of experiencing unsafe conditions while in a family's home?
 - a. Research and learn more about the surrounding neighborhood before the visit.
 - b. Maintain situational awareness of other people and pets in the home.
 - c. Make the visit as brief as possible to minimize time spent in the home.
 - d. Maintain an updated visit schedule with the main office.
7. The community nurse is working with a family and determines one of the family members is repeatedly telling another family member who has a disability that "he needs to stop being lazy and get a job." This is an example of what type of abuse?
 - a. Sexual abuse
 - b. Physical abuse
 - c. Emotional abuse
 - d. Neglect
8. Which of the following would be included on a genogram?
 - a. Occupations
 - b. Religious affiliations
 - c. Sources of health care
 - d. Health conditions
9. A community nurse is making a home visit to a client who has recently had a baby and has a history of experiencing IPV. During the visit, the nurse observes an interaction between the client and the baby's father. The father seems very loving and attentive to the client. Which of the following is the most appropriate conclusion by the nurse?
 - a. The client's history must be inaccurately documented.
 - b. The IPV has been resolved and is no longer an issue for the couple.
 - c. The couple appears to be in the honeymoon phase of the IPV cycle.
 - d. The couple appears to be in the tension-building phase of the IPV cycle.
10. A community nurse is making a visit to an older adult client. The nurse identifies which of the following strategies that can be used in prevention of abuse in this client population?
 - a. Take the time to listen to the client and the family to offer resources and support.
 - b. Talk to the caregiver or family member only since older adults are often confused.
 - c. Talk to the older client alone without involving family members.
 - d. Because it is likely that older adult clients are abused, provide resources to other housing options.

CHAPTER 29

Caring Across Practice Settings

FIGURE 29.1 Community health nurses practice across a variety of settings. In this photo, an occupational health nurse assesses a client who is on the job. (credit: modification of work “Naval Branch Health Clinic Albany Occupational Health” by Deidre Smith/Naval Hospital Jacksonville/Flickr, Public Domain)

CHAPTER OUTLINE

- 29.1 Occupational Health
 - 29.2 School Health
 - 29.3 Correctional Nursing
 - 29.4 Public Health Nursing and Public Health Departments
-

INTRODUCTION A community health nursing student, Noah is interested in working in community and public health nursing upon graduation. He has had a wide variety of clinical experiences in the community. As a part of his program, he has experienced multiple community nursing settings, including a public school-based clinic, a maximum-security prison, and occupational health nursing at a large biotechnology firm. Noah recognizes that these practice settings focus on health promotion, disease prevention, and education. Noah tells his professor that in these roles, he sees the nurses making a difference in the lives of clients. In his next rotation at a local health department, Noah will help the nurse conduct a vaccine clinic and participate in emergency preparedness drills.

Community and population health nurses can work across a variety of practice settings caring for diverse clients and communities. This chapter will highlight common practice settings for community and population health nurses, such as occupational health, school health, correctional nursing, and public health departments.

29.1 Occupational Health

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 29.1.1 Describe the history of occupational health nursing.
- 29.1.2 Examine competencies in occupational health nursing.
- 29.1.3 Describe the scope of practice in occupational health nursing.
- 29.1.4 Define the role of the Occupational Safety and Health Administration and the National Institute for Occupational Safety and Health.
- 29.1.5 Differentiate between various occupational health risks to promote safety.
- 29.1.6 Describe occupational health practice settings and nursing roles.
- 29.1.7 Explain how to conduct an incident investigation to ensure continuous improvement in safety.

Occupational and environmental health nursing focuses on providing preventive health care, health promotion, and health restoration in work environments. With origins in public health, this specialty focuses on integrating occupational safety and health protection efforts with health promotion activities to protect workers, promote health, and prevent disease, illness, and injury (Topcu & Ardahan, 2019; American Board for Occupational Health Nurses [ABOHN], n.d.; Topcu & Ardahan, 2019). Occupational health nursing is research-based with a conceptual framework reflecting an interprofessional background of nursing science, medical science, public health science, occupational health science, social and behavioral sciences, and principles of business management and administration (American Association of Occupational Health Nursing [AAOHN], 2012). Occupational health nurses (OHNs) help clients make informed decisions regarding health care concerns, advocate for clients by fostering equitable and quality health care, and ensure the environments in which clients work and live are healthy (AAOHN, 2012).

In 2022, the U.S. workforce numbered approximately 160 million (U.S. Bureau of Labor Statistics [USBLS], 2023c). These numbers support the need for OHNs to ensure a safe and healthy work environment.

- In 2021, private industry reported 2.6 million nonfatal workplace injuries and illnesses (USBLS, 2022b).
- In 2021, private industry reported 5,190 fatal work injuries, an 8.9 percent increase from 2020 (USBLS, 2022a).
- In 2021, transportation incidents were the largest cause of fatalities, accounting for almost 40 percent of all work-related fatalities (USBLS, 2022a).
- Black workers bore a disproportionate burden of work-related deaths in 2021, accounting for 12.6 percent of total fatalities, a 20.7 percent increase from 2020 (USBLS, 2022a).
- In 2022, more than 25 percent of Black worker fatalities resulted from violence and other injuries by people or animals (USBLS, 2022a).

History of Occupational Health Nursing

Occupational health nursing, first called **industrial health nursing**, arose in the United States in the late 1800s when companies in Pennsylvania and Vermont hired Betty Moulder and Ada Mayo Stewart, respectively, to care for their employees and families. Since little is known about Moulder, Stewart is often credited with being the first industrial nurse (Thompson & Wachs, 2012; Topcu & Ardahan, 2019). Stewart's primary duties included health promotion, disease prevention, home visits, and maternity care.

The industrial health nursing profession continued to evolve with the second industrial revolution. Around the beginning of the twentieth century, factories employed OHNs to assist in stopping communicable disease spread—such as tuberculosis—and to prevent injuries to reduce costs (Thompson & Wachs, 2012). In addition to industrial settings, retail stores, hotels, and insurance companies also employed nurses who practiced from a preventive and public health perspective, frequently providing health and childcare education to the community and employee families. They were expected to care for workers injured on the job, assist physicians in company-provided clinical sites, and visit ill or injured workers in their homes (Thompson & Wachs, 2012). Industrial health nursing thrived during this period; the first book on the topic was published in 1919, and the American Industrial Nurses Association (AINA) was formed in 1942 to develop training for industrial nursing (Topcu & Ardahan, 2019).

More changes to this nursing specialty occurred in the latter half of the twentieth century. The Coal Mine Safety and

Health Act of 1969 and the Occupational Safety and Health Act of 1970 contributed to the growth of industrial health nursing, driven by concerns for workers' health and welfare, costs associated with injuries, and public health considerations. The Coal Mine Safety Act was passed in response to a 1968 underground coal mine explosion that killed 78 miners in West Virginia, becoming a turning point for reform after decades of mine fatalities and increasing awareness of lung disease related to working in the coal mines (U.S. Department of Labor [USDL], n.d.-c). This act was the most stringent health and safety law of its time. It required regular federal inspections of all coal mines and added health protections against lung disease (USDL, n.d.-c).

On the heels of this act, the Occupational Safety and Health Act of 1970 created two federal agencies, the National Institute for Occupational Safety and Health (NIOSH) and the Occupational Safety and Health Administration (OSHA) (Centers for Disease Control and Prevention [CDC], 2020b; USDL, n.d.-b). In 1971, AINA established a certification organization for industrial health nursing that later became known as the American Board for Occupational Health Nurses, founded officially in 1972, and is now the sole certification body for occupational health nursing. In 1977, AINA renamed itself the American Association of Occupational Health Nursing to reflect the growing diversity of workplaces and the roles of the occupational health nurse (Topcu & Ardahan, 2019). The AAOHN is the professional association for OHNs.

In 1988, OSHA hired its first nurse to provide consultation and support; in 1993, OSHA established a nursing office (Topcu & Ardahan, 2019). As discussed in the next section, OSHA has made progress in decreasing work-related injury and death by setting and enforcing standards for safe and healthy working conditions and providing training, outreach, and education (USDL, n.d.-b). In 1998, the AAOHN adopted environmental health as an essential component of occupational health nursing application; occupational health nursing became known as occupational and environmental health nursing. Environmental health focuses on the connections between people and their surrounding environments (American Public Health Association, n.d.). The AAOHN published the first standards of occupational and environmental health nursing in 1999, and they have been updated periodically, with the last update in 2019 (AAOHN, 2019; Topcu & Ardahan, 2019).

Competencies in Occupational and Environmental Health Nursing

The AAOHN provides four overarching categories and 22 competencies that define the foundation for scope and standard of practice, knowledge, and skills and a legal and ethical framework for this specialty (AAOHN, 2015). The four categories include:

- Manage Total Worker Health® (TWH)
- Adhere to professional nursing practice principles
- Demonstrate an understanding of the business climate and its impact on a community's health
- Practice culturally appropriate and evidence-based nursing care within the scope of practice

Total Worker Health® (TWH) refers to policies, programs, and practices focused on work-related safety and protection, promoting illness and injury prevention endeavors to advance worker well-being (CDC, 2020b). The TWH approach builds on the idea of a hazard-free work environment and views where an individual works as a social determinant of health (SDOH). Wages, hours, workload, health benefits, and access to paid leave impact the overall well-being of workers, families, and communities. The long-term vision is to protect safety and health and to advance workers' well-being by creating safer and healthier work (CDC, 2020b).

Workplace risk factors—such as sitting at a desk, performing shift work, or driving for long periods of time—can contribute to long-term health problems. There are work-related risk factors for obesity, sleep disorders, cardiovascular disease, and depression, among others (CDC, 2020b). The TWH approach aims to advance health and well-being by targeting work conditions.

OHNs work in various settings and roles where they may need additional competencies depending on the chosen industry. Focusing on identifying health hazards and implementing control measures to manage the risk of exposure are key roles and required competencies of the OHN. Identifying workers' exposure to health hazards can be challenging as certain chemicals, vapors, and gases may be invisible without any obvious signs (USDL, 2016b).

Table 29.1 lists common chemical, physical, biological, and ergonomic hazards in the occupational setting.

Chemical Hazards	Physical Hazards	Biological Hazards	Ergonomic Hazards
<ul style="list-style-type: none"> • Solvents • Adhesives • Toxic dusts • Paints • Substances in cleaning solutions • Diesel exhaust 	<ul style="list-style-type: none"> • Noise • Radiation • Heat • Electric and magnetic fields • Cold • Unsafe machinery and equipment • Transportation accidents • Fires or blasting 	<ul style="list-style-type: none"> • Infectious agents • Contaminated bodily fluids • Certain insects, spiders, scorpions • Venomous snakes 	<ul style="list-style-type: none"> • Heavy lifting • Repetitive motions • Vibration

TABLE 29.1 Common Workplace Hazards by Practice Setting

 **WORKPLACE ERGONOMICS**

[Access multimedia content \(<https://openstax.org/books/population-health/pages/29-1-occupational-health>\)](https://openstax.org/books/population-health/pages/29-1-occupational-health)

Ergonomics refers to a set of practices in workplaces—such as adjustable desk heights and keyboards that more naturally fit the wrist's contours—that increase worker efficiency and productivity while reducing injuries and discomfort (Mayo Clinic, 2023). The goal is to fit the workplace to the worker, as described in this video.

Watch the video, and then respond to the following questions.

1. Why is ergonomics in the workplace such an important concept?
2. What is the relationship between ergonomics and health?
3. How can the occupational health nurse incorporate ergonomics principles into various workplace settings?

Scope of Practice in Occupational and Environmental Health Nursing

The AAOHN (2012) Scope of Practice for the OHN highlights the necessary collaboration among workers, employers, and members of the occupational health team and safety team and includes:

- Identify health and safety needs.
- Prioritize interventions.
- Develop and implement interventions and programs.
- Evaluate care and service delivery.
- Provide comprehensive clinical and primary care, including assessment, diagnosis, management, and documentation of occupational and non-occupational illness and injury.
- Provide comprehensive case management for occupational and non-occupational illnesses and injuries.
- Provide holistic hazard assessment and surveillance of worker populations, workplaces, and community groups.
- Investigate, monitor, and analyze illness and injury episodes, trends, and methods to promote and protect worker health and safety.
- Comply with laws, regulations, and standards governing health and safety for workers and the environment.
- Coordinate and provide management and administration of occupational and environmental health services.
- Deliver health promotion and disease prevention strategies using primary, secondary, and tertiary principles.
- Provide counseling, health education, and training programs using adult learning approaches.
- Utilize and participate in research related to occupational and environmental health.

The scope of practice for OHNs is broad and will vary depending on the work site. Overarching concepts of community health, law, economy, politics, policy, and regulatory issues are evident within the scope of practice as OHNs are responsible for responding to legislative mandates governing worker health and safety.

AAOHN (2012) establishes standards of care for OHNs based on the scope of practice. Eleven professional practice

standards describe a competent level of performance by the OHN (AAOHN, 2012).

Occupational Safety and Health Administration

In 1970, the Occupational Health and Safety Act created OSHA to develop and enforce standards of safety that employers must follow. A **standard**, also known as a regulation, is a requirement the agency uses to evaluate whether employers follow OSHA laws (USDL, n.d.-a). OSHA organizes the standards based on the following workplace sectors: general industry; construction; agriculture; and maritime (USDL, n.d.-a). The [OSHA rulemaking process](https://openstax.org/r/oshagov) (<https://openstax.org/r/oshagov>) describes how the agency creates standards. OSHA also provides training, education, and assistance with implementing these standards (USDL, n.d.-a). OSHA educational topics include agriculture, construction, federal agencies, health care, maritime, oil and gas, and warehousing (USDL, n.d.-a).

The formation of OSHA stimulated the growth of occupational health nursing to help employers create safe and healthy work environments. Since the 1970s, the specialty has grown as OHNs can monitor workers' health status, ensure employers meet OSHA standards, implement evidence-based interventions to prevent or mitigate adverse health effects from the work environment, and develop workplace prevention programs. OSHA describes OHNs as RNs who use specialized experience and education to recognize and prevent adverse health effects from hazardous exposures in the workplace (ABOHN, n.d.).

National Institute for Occupational Safety and Health

Part of the CDC, the NIOSH is the research agency tasked with studying worker safety and health (CDC, 2023k). NIOSH was established in collaboration with OSHA from the Occupational Safety and Health Act of 1970. While OSHA creates and enforces safety standards in the workplace, NIOSH conducts research and makes recommendations for the prevention of occupational illness and injury (CDC, 2023k). NIOSH provides evidence for many of the standards that OSHA enforces. It covers workplace safety and health topics, such as hazards and exposures, chemicals, Total Worker Health®, industries and occupations, diseases and injuries, safety and prevention, and emergency preparedness and response (CDC, 2023k).

Occupational Health Nursing Practice Settings

OHNs practice in a wide variety of sites. Wherever there are employees, there may be OHNs working with employers to design health and safety programs. OHNs use an interprofessional approach to advocate for employee rights to health and safety programs. They assist employers by decreasing work-related injuries, absenteeism, and disability claims and by ensuring compliance with local, state, and federal laws and regulations on workplace health and safety. Depending on the employment site, OHNs build expertise by incorporating knowledge of chemical hazards, biological hazards, ergonomic considerations, industrial safety issues, disease management, and business management concepts. [Figure 29.2](#) lists the most common industries that employ certified OHNs. Hospitals, medical centers, and manufacturing are the most cited work settings for certified OHNs. Within manufacturing and production, OHNs may work in textiles, oil refining, machinery, the metal industry, rubber, and plastics (ABOHN, 2018). Other smaller industries where OHNs have an impact are food production, retail trade, amusement and recreational services, construction, communications, biotechnology, agriculture, forestry, fishing, and consulting.

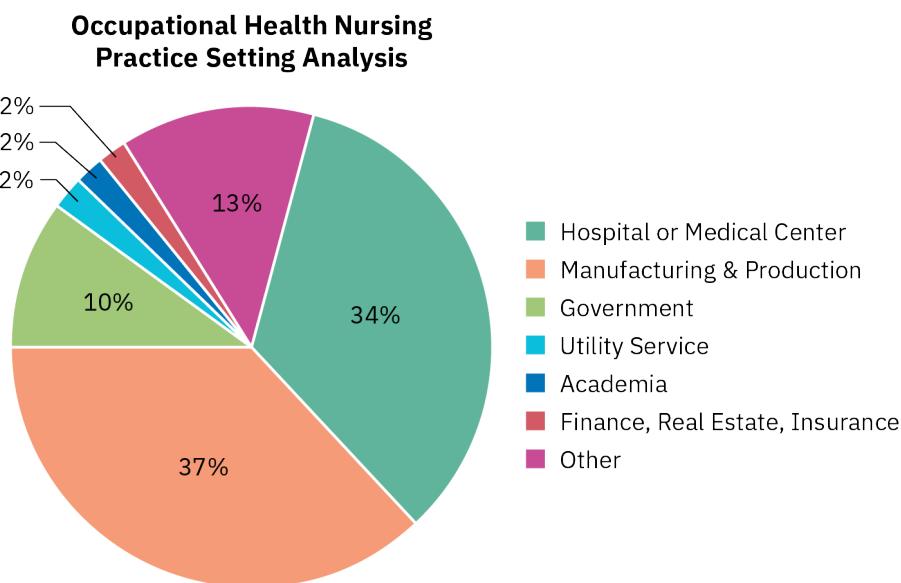

FIGURE 29.2 According to the ABOHN 2018 Practice Analysis, more than two-thirds of certified OHNs work in manufacturing and production or hospital or medical center settings. (data source: American Board for Occupational Health Nurses, Inc., 2018; attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

Occupational Health Nursing Practice Roles

Many OHNs enter the field with a baccalaureate degree in nursing and experience in community health or ambulatory care. Many pursue master's degrees in public health, business, or advanced practice nursing to further develop their professional competencies. Certification in occupational health nursing is recommended but not required. OHNs combine knowledge of health and business to provide a safe and healthy work environment while maintaining fiscal responsibility to the employer (AAOHN, n.d.). The roles and responsibilities of OHNs include:

- Case management
- Counseling and crisis intervention
- Health promotion and risk reduction
- Legal and regulatory compliance
- Worker and workplace hazard detection

Clinician

The OHN is a skilled nurse clinician primarily responsible for preventing work-related health problems and restoring health after an injury or illness. The OHN assesses workplace hazards, monitors the workers and workplace for potential issues or patterns of illness or injury, and investigates illness or injury. Fundamental to the practice, OHNs usually take an occupational health history of every worker for information on work history, on potential occupational exposures, and on the worker's current health status. The OHN can provide appropriate education and preventive steps during these assessments to eliminate or reduce potential adverse exposures.

Assessing workplace hazards is another foundational role of the OHN. This may take the form of a workplace walk-through to understand workflow, job requirements, materials utilized, presence of hazards, and employee work practices. A complete workplace survey enables the OHN to compile information about factors that support or impede employee health. It includes looking at building plans, exits and entrances, availability of emergency equipment, alarm and detection devices, and personal protective equipment (CDC, 2015; USDL, 2016b). The box below provides information on performing a workplace safety hazard evaluation (USDL, 2016b, pp. 13–15).

WORKPLACE SAFETY HAZARD EVALUATION

- Regularly inspect all operations, equipment, work areas, and facilities. Include workers on the inspection walk-through.
- Document the inspections and be sure to verify any hazardous conditions that are found are corrected.

Take photos or videos of problem areas to facilitate later discussion and brainstorming about controlling them.

- Include all areas and activities in these inspections, such as storage and warehousing, facility and equipment maintenance, purchasing and office functions, and the activities of on-site contractors, subcontractors, and temporary employees.
- Regularly inspect occupational vehicles such as forklifts, trucks, cars, etc.
- Use checklists that highlight typical hazards, such as:
 - General housekeeping
 - Slip, trip, and fall hazards
 - Electrical hazards
 - Equipment operation
 - Equipment maintenance
 - Fire protection
 - Work organization and process flow
 - Work practices
 - Workplace violence
 - Ergonomic problems
 - Lack of emergency procedures

(See USDL, 2016.)

After a work-related injury or illness, the OHN should complete an initial physical assessment and provide care and treatment of any injuries per agency protocol. Treatment may include first aid measures followed by referrals depending on the severity of the injury or illness. For legal and ethical reasons, proper documentation of occupational-related injuries is necessary. OSHA must be notified within 8 hours of a work-related fatality and within 24 hours of serious injury such as an amputation, loss of an eye, or inpatient hospitalization (USDL, 2016). Reported incidents and concerns indicate to OHN that occupational hazards exist. The OHN should have a plan and procedure for conducting incident investigations that covers who will be involved, how information will be communicated, materials or supplies needed, and reporting forms to be used. An investigation aims to identify the cause or causes of the incident or the concern to prevent further injury or illness (USDL, 2016b). A **root cause analysis** (RCA) is used to identify, evaluate, and correct the origins of accidents (USDL, 2016a). The box below provides more information on conducting an incident investigation and RCA.

CONDUCTING AN INCIDENT INVESTIGATION AND ROOT CAUSE ANALYSIS

- Begin the investigation immediately when an incident occurs.
- Conduct investigations with a trained team that includes management and workers' representatives.
- Investigate close calls/near misses.
- Ask several questions to identify all factors involved in order to determine how the incident could have been prevented.
- Identify and analyze root causes to address underlying program shortcomings that allowed the incidents to happen. The five steps in an RCA include (USDL, 2016a):
 - The Five Whys. In response to each explanation of how an incident occurred, ask between two and five why questions.
 - Build a detailed timeline around the event and analyze it.
 - Perform a change analysis, looking at all the changes in the organization that preceded the change in safety or the event, and try to define the relationship between possible causes and effects.
 - Use a cause-and-effect diagram, known as a fishbone diagram or an Ishikawa diagram, to brainstorm, categorize, and map all possible causes.
 - Avoid focusing on a single cause; identify and address all root causes for an incident.
- Communicate the results of the investigation to managers, supervisors, and workers to prevent recurrence.

(See USDL, 2016b.)

Case Manager

OHN case managers coordinate and manage the comprehensive health care services of ill or injured workers ([Figure 29.3](#)) to provide or ensure cost-effective, quality care that facilitates a safe and timely return-to-work with cost savings (ABOHN, 2021). This can involve managing issues related to health insurance, workers' compensation, and federal regulations such as the Family Medical Leave Act (FMLA). OHN case managers integrate the nursing process into their care while coordinating other necessary services. The case manager follows the worker after any incident, beginning immediately after the onset and continuing through the return-to-work phase. Case management includes mobilizing necessary resources during an injury or illness, developing preventive systems, and delivering care aligned to return the worker to pre-injury function if possible (ABOHN, 2021).

Counselor/Consultant

OHNs act as counselors or consultants to prevent work-related health problems. OHNs develop, implement, and evaluate occupational health and safety services within organizations and the community. OHNs investigate all potential material and chemical exposures that could result in adverse health outcomes in workers. Workers have a legal right to know the substances they may be exposed to at work and can request this information from the OHN. The OHN should use safety data sheets (SDS), which provide information from the manufacturers of chemicals or materials, when designing preventive educational materials on potential exposures. OHNs counsel workers about work-related illnesses, injuries, and wellness and health promotion concerns.

FIGURE 29.3 An OHN administers an influenza immunization to a city employee during a flu shot clinic, highlighting health promotion efforts to keep workers healthy. (credit: "Duggan at Speed Bump- Flu Shot N-Conf.-2111" by City of Detroit/Flickr, Public Domain)

Educator

OHNs are educators in all their roles in occupational and environmental health. The OHN participates in developing and implementing health promotion programs that support business objectives while promoting wellness and injury prevention. Health promotion objectives include creating environments that provide work-life balance for workers and prevention programs related to potentially hazardous exposures in the workplace. Health promotion programs require the OHN to effectively teach and motivate workers on a topic. Common topics include hearing protection, eye protection, nutrition, exercise, and smoking cessation. See [Health Promotion and Disease Prevention Strategies](#) for health promotion models that could be used in the occupational health setting.

Administrator/Corporate Director

OHNs often participate in the development, management, and evaluation of the health and safety program of the

organization. This requires the OHN to act in a leadership role as an administrator or corporate director. To maintain compliance with legal and regulatory requirements, organizations need written policies and procedures, and it often falls on the OHN administrator to ensure these policies are up-to-date and in full compliance with the law.

Businesses must maintain compliance with OSHA standards, and this requires the OHN administrator to give the USDL data on occupational injuries, illnesses, and deaths. OSHA distributes the record-keeping forms, and the OHN administrator completes them throughout the year, submitting them to OSHA at the year-end. In addition, the OHN administrator works on compliance with other laws and regulations, such as FMLA and tracking workers who use it.

If the OHN administrator or director would like to increase the occupational health services offered to the workers or increase the availability of personal protective equipment (PPE) based on a recent incident or RCA, the administrator is expected to write up a proposal justifying the expanded services or increased PPE request. This often requires documentation of surveillance and monitoring efforts along with audits of safety conditions in the workplace. Employers must keep health records on all workers separate from their other employment records, and the OHN administrator is often the person involved in maintaining these records and adhering to strict privacy requirements. The OHN administrator also often oversees a workers' compensation claim on behalf of the employee to ensure the worker receives appropriate benefits.

Researcher

OHNs can be researchers, identifying, analyzing, measuring, and evaluating the effects of workplace exposures and hazards for workers and community members. They can use the data they gather to implement appropriate preventive and control measures. OHNs use the data they gather on worker surveillance to identify patterns, trends, changes, and concerning issues. Utilizing this information and the identified trends, the OHN can then create targeted interventions to address the issue. Just as the NIOSH participates in occupational health-related research to arm OSHA with evidence for its standards, OHNs act as the epidemiologist or event investigator to recommend evidence-based changes to the employer to avoid future illness or injury.

The National Occupational Research Agenda ([NORA \(<https://openstax.org/r/cdcgovc>\)](https://openstax.org/r/cdcgovc)) is a program to stimulate innovative occupational health research and improve workplace practices. Established in 1996, NORA has grown to cover 10 industry sectors—such as construction and manufacturing—and seven health and safety cross-sectors—such as hearing loss prevention and respiratory health—that are organized according to major health and safety issues affecting U.S. workers (CDC, 2022i). Each sector and cross-sector council develops a national agenda for improvements in occupational health and safety. NORA provides a research framework for the NIOSH as diverse groups, OHNs included, collaborate to identify the most pressing health and safety issues in the workplace. The number of workers at risk for a particular injury or illness, the severity of the hazard or issue, and the probability that new information can make a difference all inform NORA's priority-setting process (CDC, 2022i).

29.2 School Health

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 29.2.1 Discuss the history of school nursing.
- 29.2.2 Explain the scope and standards of practice of the school nurse.
- 29.2.3 Describe the role of the school nurse.
- 29.2.4 Examine two frameworks for school nursing practice.
- 29.2.5 Identify common health problems of children and adolescents in the school setting.
- 29.2.6 Explain the nurse's role in planning, implementing, and evaluating evidence-based interventions (primary, secondary, and tertiary) to improve outcomes and safety for school community members.

School nursing focuses on protecting and promoting student health by facilitating optimal development and promoting academic success. School nurses are health care and education leaders who advocate for student-centered care, provide care coordination, and collaborate with school administrators, staff, teachers, caregivers, and the interprofessional health care team (National Association of School Nurses [NASN], 2023). Over 40 percent of school-aged children in the United States have at least one long-term health condition, such as food allergies, seizure disorders, asthma, diabetes, and oral health challenges. The school nurse is often the only health care provider in a school and plays an integral part in the daily management of these conditions (CDC, 2022k).

History of School Nursing

The school nursing role changed dramatically in 1975 after Congress passed the Education for All Handicapped Children Act, known as EHA (U.S. Department of Education [USDE], 2023). Before the passage of this act, children with disabilities and complex or long-term medical issues were not allowed to attend public school and were often institutionalized, even against a family's wishes (Nighswander & Blair, 2022). After years of court battles, the early 1970s brought forward two national court cases and an exposé on Willowbrook State School, one of the institutions where children with intellectual disabilities were sent, setting the stage for the EHA to be signed into law (Nighswander & Blair, 2022). In 1990, EHA was renamed the Individuals with Disabilities Education Act (IDEA) (USDE, 2023). School nurses then began caring for children with seizure disorders, cardiac conditions, cystic fibrosis, quadriplegia, asthma, life-threatening allergies, sensory deficits, and intellectual disabilities, among many others. An increase in complex medical conditions has resulted in an increased need for school nurses to perform specialized skills, such as tube feedings, urinary catheterizations, tracheostomy care, and suctioning. Students with long-term conditions comprise a quarter of student caseloads (Bergren, 2017).

 **GERALDO RIVERA – THE P&A SYSTEM**

[Access multimedia content \(<https://openstax.org/books/population-health/pages/29-2-school-health>\)](https://openstax.org/books/population-health/pages/29-2-school-health)

In 1972, investigative reporter Geraldo Rivera published an exposé documentary, "Willowbrook: The Last Disgrace," revealing the gruesome conditions at Willowbrook State School in New York. The school housed children with intellectual disabilities, many of whom were forced to live in these institutions for their entire lives due to perceived or actual intellectual disabilities, along with some physical disabilities such as sensory deficits or cerebral palsy. This short video illustrates how Rivera's television broadcasts led to the development of the P&A Systems in 1975. Note that the video contains graphic images and nudity, portrays profound suffering and abuse, and uses language that is now considered offensive. In the past, the term "mentally retarded" was used to describe individuals with a wide range of developmental disabilities. As society has gained a greater understanding of disabilities, the language surrounding them has evolved.

Watch the video, and then respond to the following questions.

1. How did the passage of the EHA affect views about and treatment of children and adults with disabilities?
2. Why is it important for you, as a future nurse, to be aware of how institutions like Willowbrook State School treated clients with intellectual or physical disabilities?

Scope and Standards of Practice for the School Nurse

In 1983, the American Nurses Association (ANA) and the NASN published the first edition of the standards of school nursing practice (Yonkaitis & Reiner, 2022), and in 2001, the ANA and NASN recognized school nursing as a specialty practice, requiring a different manual than the general nursing scope and standards of practice. Every five years, the scope and standards of practice are reviewed and updated by a diverse workgroup of practicing school nurses, school nurse supervisors, independent school nurse consultants, and nurse educators, all from a variety of educational backgrounds, representing different regions of the country (Yonkaitis & Reiner, 2022).

The scope of school nursing practice describes what school nursing means to school nurses, administrators, families, school board members, and the public. This includes who school nurses are, what they do, where they do it, and when, why, and how they do it. The scope of practice includes concepts of social justice, an updated ethical code for school nurses, emergency and disaster preparedness, and utilization of the Framework for 21st Century School Nursing Practice (Yonkaitis & Reiner, 2022).

The Standards of School Nursing Practice include 18 practice standards that provide the professional expectations to guide school nursing practice that align with the broader nursing profession. These standards are divided into two groups, the Standards of Practice and the Standards of Professional Performance (Yonkaitis & Reiner, 2022). The first six standards are the nursing process in action: assessment, diagnosis, outcome identification, planning, implementation, and evaluation. The implementation standard has two subcategories specific to school nursing: care coordination, and health teaching and health promotion (Yonkaitis & Reiner, 2022). Within the nursing process, school nurses collaborate with families and school staff when caring for students. The remaining 12 standards fall

under the category of Standards of Professional Performance and include the following: ethics, advocacy, equitable practices, communication, collaboration, leadership, education, scholarly inquiry, quality of practice, professional practice evaluation, resource stewardship, and environmental health (Yonkaitis & Reiner, 2022).

Role of the School Nurse

School nursing has evolved from screening for infectious diseases to managing various chronic conditions, complex medical needs, and comprehensive care coordination. The student population has changed over the last 20 years, with more children affected by food insecurity, lower socioeconomic status, homelessness, language and cultural barriers, discrimination, and challenging long-term health issues (Center for American Progress, 2022) ([Figure 29.4](#)). School nursing involves issues of social justice and advocacy, incorporating the SDOH into the needs assessment of the children. The dual focus on individual and population health means the school nurse is often a child's only consistent contact with the health care system (Willgerodt et al., 2018). School nurses engage in population health practices of health promotion, screening, injury, illness, and disease prevention to promote health through advocacy efforts, education, and connecting children and families to needed resources (Bergren, 2017). School nurses are change agents, improving the health of children, families, and communities.

FIGURE 29.4 A school nurse has many roles, such as coordinating on-site vision screenings for students. (credit: “1-14 Soldiers Give Vision Screenings at Nanaikapano Elementary School” by 2nd Stryker Brigade Combat Team, 25th Infantry Div/Flickr, CC BY 2.0)

▶
SCHOOL-BASED HEALTH CENTERS: HERE FOR THE KIDS

[Access multimedia content \(<https://openstax.org/books/population-health/pages/29-2-school-health>\)](https://openstax.org/books/population-health/pages/29-2-school-health)

This video from the Massachusetts Department of Public Health highlights how School-Based Health Centers are making a difference in the health and well-being of students across the state.

Watch the video, and then respond to the following questions.

1. What is the nurse’s role in a school-based health center?
2. What do you think the CEO of Lynn Community Health Center meant when she said that “school-based health centers are the perfect integrated primary care and behavioral health program”?

Clinical Care Provider

A school nurse’s primary role is to use the nursing process to provide direct care to students with long-term and acute medical conditions. For students with chronic medical conditions, school nurses work with the student’s primary care provider to develop an **individual health plan** (IHP) to guide a plan of care.

In addition to providing direct nursing care to students, school nurses are also involved in health screenings. Each state has different requirements for school health screenings. In general, these screenings may include:

- Hearing
- Vision
- Dental
- Scoliosis
- Postural screening
- Body mass index
- Screening, brief intervention, and referral for treatment (SBIRT) to identify substance use risk behaviors

Health Educator

School nurses are responsible for educating school staff on common health conditions in classrooms and what to do in the case of an emergency such as an allergic reaction. They educate children, school staff, families, and communities on healthy behaviors and healthy environments for optimal wellness.

Advocate

School nurses advocate for students, families, school staff, and the communities they serve. At the individual level, school nurses are a part of the individual education plans (IEPs) that students may need to promote academic success. They advocate at the local, state, and federal levels. School nurses are involved with national initiatives to provide nutritious school food, universal breakfast, and increased access to free school lunches; to increase physical education and physical activity in classrooms; and to establish longer recess times. These initiatives allow school nurses to champion healthier choices and healthier school environments with the support of other like-minded educators and community health leaders (Bergren, 2017).

The roles described above are at the foundation of the two current frameworks for school nursing practice, the *Framework for 21st Century School Nursing Practice* and the *Whole School, Whole Community, Whole Child Model*.

Framework for 21st Century School Nursing Practice

NASN developed the [Framework for 21st Century School Nursing Practice \(<https://openstax.org/r/nasnorg>\)](https://openstax.org/r/nasnorg) to guide school nursing practice. This framework aligns with the CDC's Whole School, Whole Community, Whole Child (WSCC) model for addressing health in schools (2016), which is discussed later in this chapter. The student is in the center of the framework, encircled by family and the school community. Within the framework, five interconnected principles—care coordination, community and public health, leadership, quality improvement, and standards of practice—highlight related practice components, actions, and activities that align with each principle. These principles are not hierarchical; they are interrelated practice components of school nursing (NASN, 2016).

Care Coordination

Care coordination brings together student-centered activities to deliver health services. It includes case management, long-term disease management, interprofessional collaboration and communication, direct care, education, student-centered care plans, student self-empowerment, and transition planning (NASN, 2016). Case management provides collaborative care among the child, family, health care providers, and the school. Long-term disease management involves tertiary prevention, student disease self-management, and helping students and families access needed resources. Collaborative interpersonal communication ensures continuity of care (NASN, 2016). Direct care interventions address acute, urgent, or long-term health needs based on standard protocols, routine treatments, and medication administration. School nurses instruct individual students and families on topics supporting student self-care and self-management and address student and family health literacy and health care decision-making. Student-centered care plans, such as IHPs and emergency action plans (ECPs), involve individualized nursing care, based on a specific student, after a thorough nursing assessment (NASN, 2016). Student-centered care fosters student involvement in the change process to encourage autonomy. Transition planning supports student health and learning when transitioning between grade levels or moving in between school and health settings (NASN, 2016).

Community and Public Health

Using community and public health knowledge and skills, the school nurse delivers the following components of nursing care across school populations (NASN, 2016):

- Access to care: ensuring student access to quality care, a school nurse, insurance coverage, transportation, and timeliness of care
- Cultural competency: culturally responsive care where health services are appropriate and respectful of the needs of diverse populations
- Disease prevention: primary, secondary, and tertiary
- Environmental health: all aspects of the natural and built environment, including the building, classrooms, pest management, heating, cooling, and outdoor spaces, among others
- Health education: developmentally appropriate instruction that targets a specific learning need

The school nurse strives for health equity, the state in which everyone has an opportunity to achieve their health potential. Utilizing health promotion interventions and population-based care interventions means improving health by shifting the focus beyond individual behavior to social and environmental interventions to improve populations—such as school children—in the context of their everyday life (NASN, 2016). Risk reductions are strategies to decrease the likelihood of experiencing an adverse health outcome and require the nurse to consider the hazards of disease (NASN, 2016). Screenings, referrals, and follow-up refer to secondary prevention activities to detect and treat health conditions early to promote better health outcomes. Referral and follow-up are a means to connect students with resources and health professionals. SDOH, in the context of school nursing, are described as social needs that nurses can address and advocate for changes in the infrastructure causing the inequities that create these social needs. Surveillance is the ongoing collection and interpretation of health-related data to plan, implement, and evaluate public health practice (NASN, 2016).

Leadership

Leadership incorporates the value of change, leading education and health care reform through advocacy. This includes acting as change agents, engaging in lifelong learning, embracing models of practice and professionalism, promoting policy development, and leading at a systems level (NASN, 2016). Being a change agent requires the nurse to communicate clearly and advocate when confronted with a concern or an issue. Leadership traits include a commitment to lifelong learning and engaging in professional behaviors of accountability, collaboration, professional speech, positivity, and evidence-based, student-focused activities that align with current practice (NASN, 2016).

Quality Improvement

Quality improvement (QI) refers to an ongoing assessment and data collection process to promote continuous improvement and growth. QI includes documentation, data collection, evaluation, and research (NASN, 2016). The Plan-Do-Study-Act tool is often used in QI because it is circular, illustrating the continuous process. It has also been described as the nursing process in action (NASN, 2016). School nurse notes describe daily activities and health events while including progress in meeting set goals on a student's health plan. Documentation highlights the myriad of roles and activities the school nurse participates in and outlines how time is spent (NASN, 2016).

Standards of Practice

The standards of practice outline school nursing practice components. These require competent nursing care that applies critical thinking to the nursing process. Standards of practice include clinical competence, clinical guidelines, code of ethics, critical thinking, evidence-based practice, NASN position statements, and Nurse Practice Acts (NASN, 2016). Clinical competence is the expected level of clinical performance for a professional nurse maintained through continuing education and collaboration. The NASN code of ethics, based on the ANA's code of ethics, is grounded in the core values of child well-being, diversity, excellence, innovation, integrity, leadership, and scholarship for school nurses. A **Nurse Practice Act** is a state law that determines the scope of practice of nursing that school nurses must follow (NASN, 2016). The Scope and Standards of Practice outline expectations for school nursing practice where the scope is influenced by state law and regulations and the standards describe the level of competency expected for each step of the nursing process (NASN, 2016).

Whole School, Whole Community, Whole Child Model

The CDC and the Association for Supervision and Curriculum (ASCD) created the [WSCC Model \(<https://openstax.org/r/cdchealthyschools>\)](https://openstax.org/r/cdchealthyschools) to address health in schools (CDC, 2023n). This model focuses on the student, emphasizing the role of the community in supporting the student and the school and highlighting the relationship between health and academic achievement (CDC, 2023n). The WSCC Model has 10 components: physical education and activity; nutrition environment and services; health education; social and emotional climate; physical environment;

health services; counseling, psychological, and social services; employee wellness; community involvement; and family engagement (CDC, 2019b). The model aims to improve learning and health in school systems nationwide by strengthening collaborative approaches to wellness, recognizing that it is more effective to establish healthy behaviors in childhood than to change unhealthy behaviors in adulthood (CDC, 2023n).

THEORY IN ACTION

The WSCC Model

[Access multimedia content \(<https://openstax.org/books/population-health/pages/29-2-school-health>\)](https://openstax.org/books/population-health/pages/29-2-school-health)

This video from the CDC describes how the WSCC Model provides educational funding for HIV, sexually transmitted diseases, and pregnancy prevention. It also illustrates how the Division of Adolescent and School Health (DASH) works closely with youth-serving education and health organizations to ensure programs, policies, practices, and research integrate the WSCC Model's school components.

Watch the video, and then respond to the following questions.

1. Why is an image of a student at the center of the graphic depicting the WSCC Model?
2. What is the purpose of the coordination ring?
3. Where does “community” fit into the WSCC Model?

Health Education

Health education aims to help students develop the knowledge, attitudes, and skills necessary to make health-promoting choices, become health literate, and engage in health-enhancing behaviors (CDC, 2021a). A comprehensive health education curriculum includes drug use, alcohol use, nutrition, healthy eating habits, emotional health, personal health, physical activity, safety, injury prevention, sexual health, tobacco use, and violence prevention. Health education curricula should adhere to the National Health Education Standards ([NHES](https://openstax.org/r/shapeamerica) (<https://openstax.org/r/shapeamerica>)).

Nutrition Environment and Services

School nutrition is an essential building block in a child’s academic foundation. Healthy eating is linked to improved learning outcomes—helping to ensure students can reach their potential (CDC, 2021a). The school nutrition environment should model healthy eating through the availability of foods, beverages, and nutritional education. Foods and beverages that students can access in the cafeteria, vending machines, concession stands, school stores, etc. must meet federal nutrition standards and the needs of students. All individuals in the school and the community are responsible for promoting healthier foods and beverages, modeling healthy behaviors, and ensuring access to free drinking water throughout the day (CDC, 2021a).

Employee Wellness

Fostering the well-being of school employees helps to support student health and success. Healthy school employees, teachers, administrators, custodial staff, and bus drivers, among others, are more productive and serve as role models for students (CDC, 2021a). Comprehensive school employee wellness programs address health conditions and multiple risk factors, such as tobacco use, eating habits, alcohol use, and physical activity levels, through programming, policies, benefits, and support (CDC, 2021a). Wellness programs can help to decrease health costs overall, reduce employee turnover, and increase stability in the school (CDC, 2021a).

Social and Emotional Climate

A school’s social and emotional environment may impact student engagement in school activities and overall academic performance. Positive social and emotional climates encourage engagement in learning and in maintaining relationships with other students, staff, family, and community members. This promotes overall health and growth and development through a safe and supportive learning environment.

Physical Environment

The physical environment of a school includes the school building, its contents, the land it is located on, and the area surrounding it. Healthy physical environments promote learning by ensuring students’ and staff’s health and safety. A healthy physical environment also protects students and staff from crime, violence, and injuries; from

biological and chemical threats in the air, water, or soil; and from air pollution, mold, pesticides, and cleaning agents.

Health Services

School health services address actual and potential health problems: providing first aid, emergency care, and assessment; planning for chronic conditions like asthma and diabetes; and offering wellness promotion and preventive services. Health services are interprofessional—engaging school staff, students, families, the community, and health care providers to work collaboratively to promote healthy students and healthy school environments. This includes appropriate referrals to qualified health professionals in the community. Recognizing the impact of SDOH and supporting students and families in adapting to social stressors and economic barriers to health are additional important pieces of school health services (CDC, 2021a).

Counseling, Psychological, and Social Services

Supporting students' mental, behavioral, and social-emotional health in the school setting is vital to promote health, wellness, and learning. Counseling, psychological, and social services include prevention activities such as psychological and psychoeducational assessments and interventions to address psychological and social barriers to learning, such as counseling and referrals to community services. School-employed mental health professionals, such as school counselors, school psychologists, and school social workers, can bridge services provided in school to those provided in the community and align interventions appropriately (CDC, 2021a).

Community Involvement

Schools, students, and families benefit from partnerships with local community-based organizations, groups, and businesses. Students and families benefit when school staff obtain and coordinate information on resources and services available from community organizations and groups. Community groups benefit when schools promote service-learning and volunteering in the community and when schools share facilities with community members.

Family Engagement

Families play an integral role in student academic success. School staff and families must engage with each other as student success is a shared responsibility. Staff must be committed to making families feel welcomed, and families must be willing to spend time actively engaged. Having a supportive and engaged school and home environment promotes health, well-being, and learning.

Physical Education and Physical Activity

Schools need to create an environment that fosters physical activity throughout the day. As part of the WSCC Model, the comprehensive school physical activity program (CSPAP) is a national physical education and activity framework with five components: physical education, physical activity during school, physical activity before and after school, staff involvement, and family and community engagement. The building block of this framework is physical education within the school curriculum, which provides instruction in developing motor skills, knowledge, and behaviors for healthy and active living. Providing opportunities for students to learn key concepts and practice skills needed to maintain physically active lifestyles is central to a solid physical education.

Health Promotion

The school nurse engages in health promotion activities to encourage healthy behaviors, prevent illness or disease, and promote overall wellness. These health promotion activities can be at the individual, family, or community level, encompassing students, families, school staff, and the community, and can be at the primary, secondary, or tertiary levels. See [Table 29.2](#) for some examples.

Primary Health Promotion

Primary health promotion activities focus on education to prevent disease by limiting risk exposure or through immunizations. Examples of primary prevention activities the school nurse may participate in include:

TABLE 29.2 Levels of Health Promotion

-
- Administer immunizations
 - Teach/educate on health promotion practices:
 - Hand hygiene
 - Dental hygiene with daily flossing and twice-daily brushing with fluoride toothpaste
 - Healthy food choices
 - Injury prevention with seatbelt use in motor vehicles and the use of helmets with bicycle riding, skateboarding, rollerblading, and similar activities
 - Water safety in pools, lakes, and oceans
 - Substance use prevention, including tobacco, vaping products, alcohol, marijuana, and other drugs
 - Importance of yearly flu vaccinations
 - Importance of regular physical activity
 - Sexual health and prevention of sexually transmitted diseases

Secondary Health Promotion

Secondary health promotion activities involve screenings to identify diseases before the onset of signs or symptoms and to detect diseases early to avoid complications from the disease. Examples of secondary prevention activities include:

- Assess students who become ill or injured at school
 - Provide first aid and care to students with acute injuries or illnesses at school to mitigate complications from the injury or illness
- Assess emergency plans for students and staff
 - Create emergency plans for students with life-threatening allergies
 - Maintain an inventory of emergency supply equipment and medications
- Perform screening for early detection of disease and referrals as appropriate
 - Vision and hearing
 - Height and weight
 - Oral health
 - Postural health: scoliosis and kyphosis
 - General physical examination
 - SBIRT
- Assess children for evidence of neglect or other forms of abuse
State and federal law mandates school nurses to report all suspected cases of abuse and neglect
- Assess students' mental health illness, crisis, suicidality, and violence
 - Identify students at risk

Tertiary Health Promotion

TABLE 29.2 Levels of Health Promotion

Tertiary prevention activities target the outcomes of a disease—aiming to reduce the severity or effects of the disease and associated sequelae—and often focus on rehabilitation (Kisling & Das, 2023). Examples include:

- Assess children with complex medical care needs or disabilities
 - Participate in developing the IEP and IHP
 - Work with the student and family to develop long-term outcomes
 - Provide nursing care for students with chronic medical conditions, such as asthma, diabetes, and cystic fibrosis
 - Administer medications according to health care provider prescription and with written caregiver consent
 - Provide care to students with specific health needs such as urinary catheterizations, dressing changes, intravenous (IV) line monitoring, tracheostomy suctioning, tube feeding administration, and blood glucose monitoring
- Provide ongoing care for adolescents who are pregnant or who are already parents
 - Assist in pregnancy identification
 - Provide parenting education
 - Educate on the prevention of future pregnancies

TABLE 29.2 Levels of Health Promotion

Common Health Concerns

Within the school setting, certain health problems occur among students. This section will outline the most common health concerns in elementary, middle, and high school students.

Asthma

Asthma is one of the leading chronic illnesses among children in the United States and a leading cause of school absenteeism (CDC, 2022a). This long-term respiratory condition results in inflamed airways during an exacerbation causing wheezing, chest tightness, and shortness of breath. Exacerbations result from asthma triggers such as pollen, mold, tobacco smoke, exercise, infections, or cold air. When asthma symptoms worsen, it is referred to as an asthma attack. Asthma has no cure, but effective treatments exist to manage its symptoms.

School nurses are heavily involved in creating safe and supportive learning environments for students with asthma. They can help students understand and use asthma medications correctly and refer them to medical care. Nurses and other school staff work together to ensure the school environment is free from common asthma triggers. Every student diagnosed with asthma must have an asthma action plan in place with the school nurse that is updated annually by the student's primary care provider in conjunction with the school nurse and the student's family. This plan provides the information and directions necessary for the school nurse to ensure the safety of the student and helps to control the symptoms to prevent or minimize the danger of acute asthma attacks.

Diabetes

Diabetes is a chronic disease characterized by high levels of glucose in the blood, resulting in many symptoms; over time, diabetes can cause serious health problems affecting the heart, brain, kidneys, eyes, and feet. Among school-age children, type 1 diabetes is more common than type 2 (National Institute of Diabetes and Digestive and Kidney Disease [NIDDKD], 2020). With type 1 diabetes, the pancreas does not make insulin, a necessary hormone to transport glucose into the cells for use as energy. Therefore, students with type 1 diabetes require insulin injections multiple times daily to survive. Diabetes is managed by checking blood glucose levels throughout the day to ensure they stay within a target range. Generally, eating food increases glucose levels, although physical activity, insulin, and other diabetes medications will cause glucose levels to decrease (NIDDKD, 2020).

In the school setting, managing diabetes is most effective when the student, family, school nurses, teachers, counselors, coaches, food service employees, administrators, and health care providers all work together to ensure the student has what they need to stay healthy and prepared to learn (CDC, 2022d). The school nurse is integral in caring for these students and ensuring a plan exists to handle any diabetes-related emergencies. In collaboration with the student's caregivers, provider, and school staff, the nurse ensures there is a Diabetes Medical Management Plan (DMMP) that outlines services the school will provide and how to recognize and treat signs of high and low blood sugar levels (CDC, 2022d). Depending on the student's age, the nurse either checks their blood glucose levels

or provides support to help a student monitor it themselves. Additionally, the nurse will be involved with all medication administered, as outlined in the DMMP. The school nutrition staff and nurse encourage healthy eating behaviors and should involve the caregivers in reviewing school menus to help them make informed choices. School nurses are often in charge of ensuring glucagon emergency kits are up to date and available, along with glucose tablets or other fast-acting carbohydrates in the case of hypoglycemia (CDC, 2022d).

Epilepsy

Epilepsy refers to conditions affecting the brain resulting in recurring seizures—it is not always known why some people develop them. Many individuals with epilepsy can control their seizures with medications. Some seizures appear as daydreaming or staring spells, although others are more dramatic, causing a person to collapse, stiffen, shake, and become unaware of what is happening around them (CDC, 2022e). Seizure triggers include sleep deprivation, illness, flashing bright lights or patterns, alcohol, drug use, stress, hormonal changes, poor eating habits, dehydration, specific foods, and missed medications.

Without the right support, epilepsy can negatively affect a student's ability to succeed in school. Students with epilepsy are more likely to miss 11 or more days of school and are more likely to have difficulties in school, use special education services, and have activity limitations in comparison to students with other medical conditions (CDC, 2022e). It is estimated that for every 1,000 students, six will have epilepsy (CDC, 2022e). Managing epilepsy at school involves the school nurse, teachers, staff, and coaches, requiring them to understand what it is, how to provide seizure first aid, helping students avoid seizure triggers, and monitoring for and addressing any related medical conditions like mental health concerns. The nurse should educate teachers and school staff on epilepsy care and first aid and be involved in educating other students on the stigma associated with epilepsy to promote the overall wellness of all students. The nurse collaborates with the student's health care provider to implement a seizure action plan, including administering rescue medications (CDC, 2022e). Case management services are integral to the nursing care plan for students with any medical condition that disrupts school attendance or academic performance. Many [training programs \(<https://openstax.org/r/epilepsya>\)](https://openstax.org/r/epilepsya) to educate nurses, school staff, and other public health professionals about epilepsy exist. The CDC (2017) found that compared to children without epilepsy, a large percentage of those with epilepsy lived in very low-income households, suggesting they may have unmet health needs that could potentially be addressed within the school and community.

Food Allergies and Anaphylaxis

Food allergies affect approximately 8 percent of children, appearing at any age and even causing reactions to foods eaten for years without issue (American College of Allergy, Asthma, & Immunology [ACAAI], 2023; CDC, 2022f). A food allergy occurs when the immune system reacts to a food or a substance in the food, identifies it as dangerous, and triggers a response. Symptoms can range from mild to severe, with anaphylaxis being the most severe allergic reaction. This results in a life-threatening whole-body allergic reaction that may impair breathing, drop blood pressure, and result in shock. Anaphylaxis may occur within minutes of exposure to a triggering food and can be fatal, requiring immediate treatment with epinephrine. The following nine types of food account for 90 percent of all allergic reactions: eggs, dairy, peanuts, tree nuts, fish, shellfish, wheat, soy, and sesame (ACAAI, 2023). The foods most associated with allergic reactions in children are milk, eggs, and peanuts. Symptoms of an allergic reaction can involve the skin, gastrointestinal tract, cardiovascular system, and respiratory system. They can present with vomiting, hives, shortness of breath, wheezing, cough, shock, hoarse throat, difficulty swallowing, tongue edema, angioedema, dizziness, and anaphylaxis. Most food-related allergy symptoms occur within two hours of ingestion (ACAAI, 2023). Once the food allergy is diagnosed, the most effective treatment is to avoid the food, as there is no cure (CDC, 2022f). Evidence has shown that children may outgrow allergic reactions to milk and eggs, but peanut and tree nut allergies most often persist (ACAAI, 2023).

School nurses play a role in caring for and preventing allergic reactions in children with severe food allergies. Strict avoidance is the only way to prevent a reaction, but this may not always be possible with cross-contamination issues. School nurses are responsible for participating in the school's plan for managing food allergies; supervising the daily management of food allergies in individual students; preparing for and responding to food allergy emergencies; providing food allergy education to students, parents, and school staff; and creating and maintaining a healthy and safe school environment (CDC, 2022f). School nurses often meet with the families of young students with severe food allergies before the school year begins to ensure an individual health plan, a food allergy action plan, and a prescribed epinephrine injector pen for the student.

School staff must be educated on preventing and responding to a food allergy emergency. The school nurse is often responsible for educating school staff on how food allergies occur, cross-contamination, signs and symptoms, and emergency management, including the administration of epinephrine (CDC, 2022f). Additionally, school nurses should be a part of the team that develops the school's plan for preventing allergic reactions and the protocol for management of these emergencies. The CDC and the USDE, in collaboration with several federal agencies and partners, developed [Voluntary Guidelines \(*https://openstax.org/r/cdcgovhealthyschools*\)](https://openstax.org/r/cdcgovhealthyschools) for the Management of Food Allergies in Schools and Early Care Education Programs to provide practical information and recommendations on five priority areas that should be addressed in each school's Food Allergy Management Prevention Plan. Studies have demonstrated that one-third of children with food allergies have been bullied because of them; therefore, the psychosocial impact of having a food allergy needs to be discussed with all school staff, and plans must be in place to prevent and/or address these behaviors if they were to occur (Massachusetts Department of Elementary and Secondary Education, 2016).

Obesity

Obesity is defined as a weight higher than what is considered healthy and is dependent on height (CDC, 2022c). Body mass index (BMI) is a tool utilized to screen for obesity. BMI is calculated by dividing an individual's weight by their height (CDC, 2022c). Because children and teenagers are still growing, their BMI ranges vary based on their age and sex and are expressed relative to other children of the same age and sex. The BMI range for obesity in children ages 2 to 19 is a BMI that is in the 95th percentile or greater for age and sex (CDC, 2023e). In the United States, childhood obesity levels have reached epidemic levels and have become a public health concern for children and adolescents (Sanyaolu et al., 2019). Body mass index does not fully account for differences in body type, ethnicity, or activity. So, it should not be used as the sole determinant of health; however, it is widely used as a key indicator and is an element of many diagnostic and treatment paradigms.

In 2017–2018, one in five school-aged children were obese, with an even higher prevalence rate among children who are Hispanic or Black (CDC, 2022i). Obesity negatively impacts physical and psychological health and is associated with several comorbid conditions, such as hypertension, hyperlipidemia, diabetes, sleep apnea, poor self-esteem, and depression (Sanyaolu et al., 2019). Although all risk factors associated with obesity may not be known, several are known to contribute to childhood obesity (CDC, 2022i):

- Physiologic factors of metabolism and lifestyle
- Social factors related to sleep habits, eating patterns, and physical activity
- Presence of negative childhood events
- Design and safety of the neighborhood and community where one lives

Although one's metabolism and genetic makeup cannot be changed, the environment where children spend time can positively impact their health by making it easier to access nutritious foods and be physically active. The environment can be home, school, places for after-school activities, and community settings. The school nurse can advocate for policies and practices encouraging children to eat more fruit and vegetables, consume fewer foods or beverages with high sugar content, and increase daily physical activity (CDC, 2022i). Leading the school community to influence policy changes reinforcing these concepts of healthy eating and healthy movement—before, during, and after school—is an integral part of how school nurses can help address obesity. Researchers and public health professionals agree that prevention is the key strategy for controlling the obesity epidemic, with primary health promotion education aimed at children and families (Sanyaolu et al., 2019).

The COVID-19 pandemic thoroughly disrupted students' access to normal school environments and routines. According to the CDC, children gained weight at a faster rate during the pandemic, with elementary school-aged children experiencing a BMI change that was 2.5 times higher than pre-pandemic times (CDC, 2022i; Lange et al., 2021). These data demonstrate how schools can be a primary setting for obesity prevention efforts by providing regularly scheduled opportunities for physical activity, offering nutritious foods through school meal programs, providing access to a school nurse, and providing consistency and routine (CDC, 2022i). A comprehensive school approach to addressing childhood obesity is key, directing attention to nutrition and physical activity in the schools and involving nurses, caregivers, school staff, and other community members. The goal is to support the health and well-being of all students. These efforts are not meant to single out or stigmatize children who are obese, but rather to support healthy lifestyle choices from a young age.

Oral Health

Dental caries, also known as cavities or tooth decay, are common chronic diseases in childhood in the United States (CDC, 2023h). When untreated, they may result in pain and infections that can lead to problems with eating, speaking, and learning (CDC, 2022b). Studies have demonstrated that children with poor oral health miss more school and receive lower grades than those who do not have caries (Griffin et al., 2016). Children from low-income families have two times the risk of children from higher-income families of having dental caries, which results in a detrimental effect on quality of life, performance in school, and success in later life (CDC, 2022b; Singh et al., 2020).

Dental sealants are thin coatings made from resin or glass ionomers (Sikka & Brizuela, 2023) that can prevent caries for years and, when applied to the chewing surface of back teeth, have been shown to prevent 80 percent of caries (CDC, 2022b). Elementary-aged children without sealants have three times more caries than children with sealants (CDC, 2023h). School sealant programs effectively reach children in school settings; they have demonstrated an increase in the number of children who receive sealants, especially those at greater risk for developing caries (CDC, 2023h). School nurses should use leadership and advocacy skills to advocate for these programs using evidence-based guidelines and recommendations. Additionally, school nurses can advocate for community clinics to provide fluoride supplements for students living in communities without fluoridated water, as fluoridated tap water is associated with fewer dental caries than water that is not fluoridated (CDC, 2022b).

HEALTHY PEOPLE 2030

Oral Conditions

Healthy People 2030 features many [objectives related to oral health](https://openstax.org/r/healthgovh) (<https://openstax.org/r/healthgovh>). These objectives reflect the importance of preventing tooth decay and other oral health conditions with interventions targeted at the individual, community, and population health levels.

Behavioral Problems and Learning Difficulties

Behavioral problems and learning difficulties are common concerns in schools. One in every six school-age children and adolescents experience a mental health disorder each year, and half of all mental health conditions begin by age 14 (National Alliance on Mental Illness [NAMI], 2023). Children's mental disorders may include anxiety, depression, oppositional defiant disorder, conduct disorder, attention-deficit/hyperactivity disorder (ADHD), Tourette syndrome, obsessive-compulsive disorder, and post-traumatic stress disorders (CDC, 2023m). From 2013 to 2019, the most common mental health disorders diagnosed in children ages 3 to 17 in the United States were ADHD and anxiety, affecting more than one in 11 children. In older children and teens, 12 to 17 years of age, depression and suicide were more of a risk, with one in three high school students reporting sadness or hopelessness and almost one in five high school students self-reporting having seriously considered suicide (Bitsko et al., 2022).

Mental disorders can begin in early childhood and can affect any community, although certain populations are more affected due in part to the SDOH of poverty, education access, and geographic area (Bitsko et al., 2022). Half of all children and adolescents with mental health conditions do not receive appropriate treatment. Undiagnosed, untreated, or inadequately treated mental illness interferes with learning and development (NAMI, 2023). Early treatment has been shown to help children and adolescents stay in school, stay on track to meet life goals, and have overall better health outcomes (NAMI, 2023). Inadequately treated or untreated mental illness is associated with higher school dropout rates, unemployment, substance use, incarceration, and early death, with suicide being the second leading cause of death in children and young adults, ages 10–34 (NAMI, 2023).

▶ STUDENTS OPEN UP ABOUT THEIR STRUGGLES WITH MENTAL HEALTH

[Access multimedia content](https://openstax.org/books/population-health/pages/29-2-school-health) (<https://openstax.org/books/population-health/pages/29-2-school-health>)

This video discusses the mental health crisis among school-age children in the United States. Newperson Stacey Sager speaks with a group of middle school students about the mental health issues they face.

Watch the video, and then respond to the following questions.

1. What are the primary mental health issues adolescents face?

2. What strategies could the community health nurse or school nurse implement to address these issues?

School systems are well suited to provide early identification, prevention, and interventions to serve children and adolescents with mental health conditions since children spend almost a third of their day in school. School-based mental health services should be delivered by trained mental health professionals such as school psychologists, counselors, social workers, and nurses (NAMI, 2023). Schools can also connect children and families to community mental health services. Care provided in school reduces transportation barriers and scheduling conflicts and helps students access needed services throughout the school day. School nurses need to advocate for appropriate mental health services in school to ensure equitable access. This reduces the inequities and barriers for children and families in underserved communities (BIPOC) to get needed treatment (NAMI, 2023). Treating a child's mental health problems as early as possible may decrease problems in the home, in school, and in forming friendships (CDC, 2023f; 2023l). A public health approach is necessary, promoting mental health for all children, providing interventions to children at risk, and providing treatment for those with diagnosed disorders (CDC, 2023l).

Learning, language, and developmental disabilities; autism spectrum disorders; and substance use disorders can also affect how children learn and behave in school and how they handle their emotions (CDC, 2023m). Although not considered mental health illnesses, these disorders affect the child's overall mental health. Mental health is more than just the absence of a mental health disorder; it is a continuum where mentally healthy children can function well at home, at school, and in the community and have a positive quality of life (CDC, 2023m). Reaching developmental and emotional milestones, learning social skills, and coping with problems are all part of being mentally healthy (CDC, 2023m). Grappling with heightened emotions and behavior is a typical part of growing up. Supporting children's mental health involves assessments to ensure they are meeting developmental milestones, referring them when they are not, supporting positive parenting strategies, and improving access to care (CDC, 2023m).

Teen Pregnancy and Sexually Transmitted Diseases

Between 1991 and 2019, the teen birth rate in the United States declined to 16.7 per 1,000 females (CDC, 2021b). This decline has been attributed to increased use of birth control and abstinence among teens (CDC, 2021b). Among teens who become pregnant, disparities exist along racial and ethnic lines. In 2019, the birth rates for Hispanic adolescents (25.3), Black adolescents (25.8), and Indigenous adolescents (29.2) were more than twice the rate for non-Hispanic White adolescents (11.4) (CDC, 2021b).

The SDOH impact the teen birth rate on many fronts. Adolescents from families with lower income and education levels have higher rates of teen births than adolescents from families with average income and education levels (CDC, 2021b). Adolescents in foster care are twice as likely to become pregnant as adolescents who are not in foster care (CDC, 2021b). Teen pregnancy and birth directly correlate to high school dropout rates among pregnant girls—only half of teen mothers achieve a high school diploma by age 22 (CDC, 2021b).

The CDC, through its Division of Adolescent and School Health (DASH), encourages school environments where adolescents can access foundational health knowledge and skills, establish healthy behaviors, and connect to health services to prevent HIV, sexually transmitted infections (STIs), and unintended pregnancy (CDC, 2023g). DASH funds and supports school-based health promotion and disease prevention efforts related to adolescent health by building strategic partnerships and working to prepare adolescents for success in health and life (CDC, 2023a). [DASH-funded state education and health agencies \(<https://openstax.org/r/cdcgovyouth>\)](https://openstax.org/r/cdcgovyouth) conduct school-based surveillance on youth risk behaviors. The CDC has demonstrated that school health programs effectively increase quality sexual health education, provide increased access to youth-friendly health services, and increase safe and supportive environments through student-led inclusive clubs (CDC, 2019a). These interventions have resulted in a population-level reduction in sexual risk behaviors. CDC-funded school districts reported declines in the percentage of students who have had sex, were currently sexually active, and had four or more lifetime sexual partners (CDC, 2019a). The CDC's reach is limited to about 8 percent of the nation's 26 million middle and high school students. Most schools do not teach key HIV, STI, and pregnancy prevention topics or provide students with on-site services or referrals to health care providers for sexual health services (CDC, 2019a).

School health programs can reduce risky health behaviors and positively affect academic performance (CDC, 2020a). Many preventable risky healthy behaviors are formed during adolescence, contributing to suboptimal or

poor sexual health. Adolescents need to be taught early about HIV, STI, and pregnancy prevention with easy-to-understand information, including health risks and skills to help delay sexual activities. School nurses and administrators can collaborate with the CDC to bring school-based programs to schools (CDC, 2020a).

A 2021 survey of high school students in the United States found that (CDC, 2023j):

- 30 percent were sexually active.
- 48 percent had not used a condom the last time they had sex.
- 8 percent had been physically forced to have sexual intercourse when they did not want to.
- 9 percent of students had ever been tested for HIV.
- 5 percent had been tested for STIs during the past year.

Sexual risk behaviors place adolescents at risk for HIV infection, STIs, and unintended pregnancy. In 2020, 20 percent of all new HIV diagnoses were in adolescents and young adults ages 13 to 24 (CDC, 2023j). STIs affect individuals across the lifespan, but adolescents account for half of all new STI infections (CDC, 2021c). HIV, STIs, and teen pregnancy prevention programs in school should provide basic health information that can contribute to health-promoting behaviors; address the needs of adolescents who are sexually active and those who are not having sex; ensure the education provided includes skills to protect themselves and others from HIV, STIs, and unintended pregnancy; and be developed with the input of students and parents to be consistent with community values and policies (CDC, 2023j). STIs include chlamydia, gonorrhea, hepatitis, herpes, HIV, human papillomavirus, syphilis, trichomoniasis, and mycoplasma genitalium (CDC, 2021c). See [Pandemics and Infectious Disease Outbreaks](#) for more information on STIs.

Substance Misuse

Substance misuse includes harmful patterns of alcohol, tobacco, and illegal drug use that undermine a student's ability to succeed in school (National Center on Safe Supportive Learning Environments [NCSSLE], 2023). Most students do not misuse substances, but a minority do, especially students disengaged in school. Alcohol is the substance students most often misuse, and those who drink are more likely to "binge," quickly consuming large quantities of alcohol for the sole purpose of becoming inebriated (NCSSLE, 2023). Binge drinking is associated with poor school performance, involvement in other health risk behaviors such as riding in a car with someone who has been drinking, cigarette smoking, risky sexual behaviors, using illegal drugs, and being a victim of dating violence (NCSSLE, 2023). Marijuana is one of the other drugs young people misuse most often (NCSSLE, 2023).

Most adults diagnosed with substance use disorder (SUD) started using substances in their teen and young adult years (CDC, 2022h). Adolescents with SUDs have higher rates of physical and mental illness and diminished overall health and well-being (CDC, 2022h). High-risk substance use is the use of substances with a high risk of adverse outcomes, including misuse of prescription drugs; use of illicit drugs such as cocaine, heroin, methamphetamine, inhalants, hallucinogens, or ecstasy; and use of injection drugs that have a high risk of infection of blood-borne disease such as HIV and hepatitis (CDC, 2022h). In 2019, 15 percent of high school students reported using illicit or injection drugs, and 14 percent reported misusing prescription opioids (CDC, 2022h). Injection drug use places adolescents at risk for HIV and overdose. Adolescent opioid use is directly linked to risky sexual behaviors, and these students are more likely to be victims of physical or sexual dating violence. Drug use in general is associated with violence, risky sexual behaviors, mental health illness, and increased suicide risk (CDC, 2022h).

Risk factors for high-risk substance misuse in adolescents include:

- Family history of substance use
- Favorable parental attitudes toward the behavior
- Poor parental monitoring
- Parental substance use
- Family rejection of sexual orientation or gender identity
- Association with peers using substances
- Lack of school connectedness
- Low academic achievement
- Childhood sexual abuse
- Mental health issues

NASN (2022) recognizes the need for school nurses to be involved in health promotion activities related to substance use and supports using the WSCC model by providing students with education about their bodies, emotions, behaviors, and relationships with others. Advocating for evidence-based health curriculums incorporating education on drugs and alcohol empowers students to make healthy and appropriate decisions.

WHAT DO YOU DO? SCHOOL NURSES

[Access multimedia content \(<https://openstax.org/books/population-health/pages/29-2-school-health>\)](https://openstax.org/books/population-health/pages/29-2-school-health)

In this video, school nurses in Spokane Public Schools discuss their role and what it is like to be a school nurse.

Watch the video, and then respond to the following questions.

1. In addition to helping students with cuts, bruises, and seasonal illnesses, what issues do school nurses work with regularly?
2. Thinking broadly, what different groups do school nurses serve?
3. Based on the nurses in this video, what is rewarding about working as a school nurse?

29.3 Correctional Nursing

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 29.3.1 Discuss the history of correctional nursing.
- 29.3.2 Explain the scope and standards of practice of the correctional nurse.
- 29.3.3 Describe the role of the correctional nurse.
- 29.3.4 Examine settings for correctional nursing.
- 29.3.5 Identify common health problems of individuals who are incarcerated.
- 29.3.6 Explain the nurse's role in planning, implementing, and evaluating interventions (primary, secondary, and tertiary) to improve outcomes and safety for incarcerated individuals.

Correctional nursing is defined as providing nursing care to clients within the criminal justice system. Settings where correctional nurses may work include (Schoenly & Knox, 2012):

- Locked correctional settings: local jails, state prisons, federal prisons
- Local police departments
- Immigration detention centers
- Forensic hospital units
- Department of Corrections (DOC) hospitals
- DOC-managed nursing homes
- Mental health institutions
- In the general hospital caring for patients transferred from correctional settings

In the nursing and health literature, these individuals are often referred to as **justice-involved** (ANA, 2021; CDC, 2023b). The incarcerated population is very different from the general population regarding gender, race, education, and age because most people incarcerated in the United States are men, although the number of women in prison has increased dramatically (CDC, 2023d; National Commission on Correctional Health Care [NCCHC], 2020).

- Incarcerated females have reproductive health needs and are more likely to have custody of their children and to have been a victim of sexual abuse or domestic violence (American Academy of Family Physicians [AAFP], 2021; American College of Obstetricians and Gynecologists [ACOG], 2021).
- Incarcerated Black and Hispanic people are disproportionately represented in the incarcerated population (CDC, 2023d; Pew Charitable Trusts, 2023).
- White men have a rate of one out of 106 men imprisoned, whereas one out of 15 Black men are imprisoned and one out of 36 Hispanic men are incarcerated (Nellis, 2021).
- Education levels of the inmate population are lower than the general population: some sources report that less than half of the incarcerated population have a high school diploma, which is well under 20 percent for the general U.S. population (Center for American Progress, 2018; CDC, 2023d).
- At midyear 2020, inmates ages 18 to 34 accounted for 53 percent of the jail population, although inmates

aged 55 or older comprised 7 percent (Minton & Zeng, 2021).

Given the unique client population of inmates and detainees, the nurse must defer to correctional officers and safety protocols before embracing the health-promoter and care-provider role. Many layers of ethical issues are at play in correctional nursing. Correctional nurses need to develop a therapeutic relationship with individuals convicted of crimes, some of them violent and disturbing. Nurses must be able to critically evaluate and make treatment decisions for clients who may be seeking secondary gain (seeking a privileged status, a more comfortable cell or situation, or special creams or lotions) from their medical visit. This can further cloud the nurse's view of these encounters. Other ethical issues may relate to the very real limitations of being in a locked facility. For example, education plans for clients with diabetes often require fresh fruits and vegetables and cardiovascular exercise routines, but this may not be feasible in a prison setting. Other ethical issues may arise when correctional nurses are evaluating clients who are in solitary confinement where the incarcerated individual lacks meaningful contact with other individuals. The boundaries set by the corrections system can prove to be an ethical issue for nurses desiring to show compassion for clients. Another common ethical issue is the lack of privacy as corrections officers oversee all aspects of correctional centers' health care delivery system. Balancing the conflicting roles of public safety and security by the corrections department and the professional nursing mission to promote the well-being of all clients is at the heart of corrections nursing (Schoenly & Knox, 2012).

History of Correctional Nursing

The correctional setting for professional nursing practice emerged in the 1970s as prison riots and the civil rights movement shed light on barely existent prison health care services. The 1976 Supreme Court Case of *Estelle v. Gamble* established the constitutional obligation to provide health care to any individual in the government's custody, guaranteeing health care for incarcerated individuals. Before this ruling, no organized or regulated health care was provided to inmates (ANA, 2021). However, currently there are no mandatory health care standards or required health care accreditations within correctional health facilities, resulting in minimal oversight and substantial variability in access to and quality of care (ACOG, 2021). In 1985, the ANA recognized correctional nursing as a specialty and published the first Standards of Nursing Practice in Correctional Facilities. Currently two groups offer certification in correctional nursing, the American Corrections Association (ACA) and the NCCHC. In 2017, an estimated nearly 30,000 registered nurses and 20,000 licensed practical nurses worked in correctional facilities in the United States (ANA, 2021). These two organizations have published health care standards and offer accreditation of correctional health care systems, but accreditation is entirely voluntary (ACOG, 2021).

Scope and Standards of Practice of Correctional Nursing

Correctional nursing requires devotion and advocacy to care for an underserved, disenfranchised, and often-forgotten population (ANA, 2021). The scope and standard of practice for correctional nursing follows the nursing process with the addition of 11 standards reflecting culturally and ethically appropriate care that is evidence based. The 11 standards are ethics, culturally and congruent practice, communication, collaboration, leadership, education, evidence-based practice and research, quality of practice, professional practice evaluation, resource utilization, and environmental health (ANA, 2021). Within each standard, there are several competencies that can be used to demonstrate evidence of compliance with the standard (ANA, 2021).

INTRODUCTION TO FORENSIC NURSING

[Access multimedia content \(<https://openstax.org/books/population-health/pages/29-3-correctional-nursing>\)](https://openstax.org/books/population-health/pages/29-3-correctional-nursing)

Forensic nursing is a specialty of nursing providing focused care for clients who are experiencing or have experienced victimization and violence. These nurses practice with a trauma-informed approach when caring for the acute and long-term health consequences associated with victimization (International Association of Forensic Nurses, 2023).

Watch the video, and then respond to the following questions.

1. What are your impressions of forensic nursing?
2. What is the relationship between forensic nursing and caring for underserved populations?
3. What additional competencies do you think a forensic nurse needs to have to address the needs of victims

of violence and abuse?

Role of the Nurse in the Correctional Nursing

Correctional nurses use a broad range of nursing skills caring for individuals across the justice system, including incarceration, probation, parole, treatment programs, individuals housed in immigration and customs facilities, and those transitioning between settings. At the end of 2018, an estimated 6.7 million individuals were under correctional supervision, including 2.2 million individuals detained in jails and prisons and approximately 4.5 million individuals supervised under probation and parole, known as community corrections (ANA, 2021). Probation is community supervision in place of incarceration, whereas parole is a form of conditional supervised release allowing individuals to complete prison sentences in the community (ANA, 2021). Counties or cities often manage local jails and are responsible for holding individuals awaiting court hearings, trials, or sentencing, but they may also house individuals who have been sentenced to less than 12 months of detention. Prison often houses individuals convicted of a crime with sentences longer than a year. The Federal Bureau of Prisons (FBOP) manages a prison system of 130 facilities housing people whose sentences are related to federal crimes (n.d.). These facilities are dispersed throughout the United States but have consistent standards of practice and centralized management. State prison systems are under the authority of the state's government, and each state may have different practice standards. Both the FBOP and 27 state prison systems use private prisons as contractors to house some of the incarcerated population. In 2021, almost 100,000 incarcerated individuals were being detained in private prisons, representing 8 percent of the total state and federal prison population (Budd & Monazzam, 2023). States' use of private prisons varies. For example, Montana incarcerates close to half of its prison population in privately-run facilities, whereas in 23 states, private prisons are not used at all (Budd & Monazzam, 2023).

Since correctional nurses care for a broad spectrum of clients across the justice system, they need to possess strong assessment and clinical decision-making skills. This role requires flexibility, attention to detail, a solid understanding of the standards of professional nursing practice, and strong advocacy skills to be champions for access to quality health care. Correctional nurses occupy a multitude of roles while providing care and often find themselves practicing in a variety of settings with justice-involved clients, such as caring for justice-involved individuals in restricted housing, primary care clinics, urgent care clinics, inpatient infirmaries, community-based facilities, and palliative and hospice care. In addition to these practice settings, the correctional nurse provides care related to substance misuse, sexual abuse, mental health, and transitional care along with providing services like medication management, health promotion screening, and teaching. The practice of correctional nursing is more than bedside care; it is community and public health care, addressing the needs of an underserved population.

Restricted Housing

Restricted housing is a type of detention that includes voluntary or involuntary removal from the general incarcerated population with placement into a locked cell or room for most of the day (ANA, 2021). This is known as segregation, solitary confinement, special housing, enhanced security units, or isolation units, among other names. Since correctional agencies are tasked with housing justice-involved individuals in safe facilities, they need to maintain safety of the incarcerated individuals and the staff. At times, it is deemed necessary to place certain individuals who may be a threat to others, a target of violence from the general incarcerated population, or a danger to themselves into restricted housing. Correctional nurses must ensure that these special housing arrangements do not adversely impact a client's health. Numerous studies have demonstrated the higher rate of psychiatric illnesses among these individuals, ranging from anxiety and depression to hallucinations, psychosis, and suicidal ideation (ANA, 2021). Pregnant individuals, older individuals, transgender people, and adolescents are considered more vulnerable than the general incarcerated population; it can be difficult to house these individuals safely, requiring the correctional nurse to assess and advocate as necessary (ANA, 2021).

Correctional nurses are often the primary advocates for clients and need to assess and evaluate these individuals in restrictive housing and be part of the interprofessional care team to ensure their physical and psychological wellness. The NCCHC's position statement on solitary confinement is that "correctional health professionals' duty is to the clinical care, physical safety and psychological wellness of their patient and should not condone or participate in cruel, inhumane, or degrading treatment of patients" (NCCHC, 2016, p. 4). The NCCHC defines prolonged, greater than 15 days, solitary confinement as cruel and inhumane treatment and further states that adolescents, pregnant individuals, and individuals with mental illness should never be in solitary confinement.

Primary Care

Primary care in the corrections setting occurs during nursing encounters for intake screenings and assessments, sick call visits, chronic care clinic visits, medication administration, and in response to emergencies ([Figure 29.5](#)). The corrections nurse is involved in health promotion screening and education, falling under the realm of primary care. To meet public health and safety principles, infectious disease screening is imperative in a confined population. With each encounter, the nurse can educate the client on issues related to specific health needs. Correctional nurses also coordinate care between providers, arrange for ordered testing, and ensure follow-up visits with various health entities as ordered.

FIGURE 29.5 One role of nurses working in corrections settings is to provide health education to clients. (credit: "Navy Lt. j.g. Tiffany Rozas, a nurse with Joint Task Force Guantanamo's Joint Medical Group, discusses dietary nutrition with a detainee, July 9, 2010" by Joshua R. Nistas/U.S. Navy/Wikimedia Commons, Public Domain)

Acute Care

Some large correctional facilities have health facilities capable of providing acute care services, similar to those available in community hospitals. Care provided in an acute care setting is used to treat unexpected, urgent, or emergent episodes of injury and illness that could result in disability or death without intervention. The correctional nurse's role is to triage these clients and ensure the appropriate care is provided to minimize potential disability and suffering. If a facility cannot meet its client's needs, the nurse is involved in stabilizing the client and arranging for transfer to the appropriate facility.

Urgent or Emergent Care

The corrections nurse is often the first responder when there is a health care issue with a client, a visitor, or a staff member with a sudden complaint of illness, trauma, or another emergency. The nurse is responsible for responding to the location with appropriate emergency equipment and providing emergency care as needed. Depending on the assessment, the nature and severity of the injury or illness, and applicable policies, protocols, and procedures, the nurse will initiate an emergency plan of care that might include the activation of local emergency medical services (EMS). Throughout the entire process, from activating EMS, to the transition of care for the client across settings, to receiving the client back in the correctional facility, the nurse is responsible for effective communication and continuation of necessary care.

Palliative Care

Palliative care incorporates four attributes: individualized client care, support for the family, an interprofessional team approach, and effective communication (ANA, 2021). The correctional nurse may be the first health professional to recognize that a client will benefit from palliative care and needs to advocate for access to this specialty level of care. With the palliative care team, the correctional nurse develops a plan to ensure client-

centered care and may need to advocate for a release from a facility, for a nursing or home placement, or for family involvement. Correctional nurses provide palliative care by providing relief from distressing symptoms, coordinating treatments for the underlying disease or condition, integrating psychological and spiritual considerations into the care plan, offering support to assist clients to live as actively as possible, and helping clients understand their choices for treatment.

Hospice Care

Hospice care is palliative care provided to clients with less than six months to live if their disease were to follow its normal trajectory (ANA, 2021). The goal is to ensure the client's remaining time is as comfortable as possible. Correctional nurses provide this care to respect and carry out the end-of-life wishes of the client. This may involve advocating for the release from a facility, or it may mean advocating for appropriate lodging within a facility to allow for the provision of maximum comfort measures.

Transitional Care

Transitional care is moving from one facility to another or transitioning back into the community upon release from corrections. Correctional nurses are involved in assessing how well clients are adjusting to new a new facility or into the community. These nurses can act as care coordinators, making appointments, educating, and facilitating a discharge plan to continue medications, treatments, and services such as medical, dental, and psychiatric care when released from corrections (Schoenly & Knox, 2012). Just as discharge planning begins as soon as a client is admitted to a hospital, planning for reintegration back into society begins as soon as the client enters the correctional system (U.S. Department of Justice, n.d.).

Care Coordination

Correctional nurses provide care coordination services throughout a client's time in corrections through reintegration into the community. Nurses partner with the client to identify health issues, make appropriate referrals, track pending appointments and treatments, and ensure necessary care is completed. The nurse educates the client appropriately so that they can make informed decisions regarding their care. The corrections nurse is the liaison between the correctional health team, the client, and the community health team.

Medication Management

Correctional nurses administer medications that are ordered for clients and must be knowledgeable on appropriate dosing, side effects, contraindications, route of administration, and any food or drug interactions. In addition to administering the medications appropriately in compliance with state laws, the nurse needs to ensure the client is taking the medication and not "cheeking" it to divert it. Nurses are responsible for ensuring clients are properly educated about their medications and their role in managing their disease.

Health Promotion and Education

Health promotion, maintenance, and education are extremely important, given the health disparities in this justice-involved population. Often, clients have a history of a lack of access to care, to insurance, and to healthy lifestyle choices. Correctional nurses provide health education and health promotion activities for healthy lifestyles by encouraging preventive health practices and addressing health issues. By building skills for healthy living in this population, these individuals can transfer knowledge and skills when released back into communities. Correctional nurses can also educate the corrections staff on wellness issues that affect the clients such as infectious disease, first aid, responding to mental health crises, and suicide prevention. A large part of health promotion is client education. Client education helps to ensure clients are informed about their own health so that they can make informed decisions and take care of their health needs when they transition back into the community. An example of client education is the newly diagnosed client with diabetes who needs information on medication, monitoring blood glucose levels, diet, and exercise. An example of a community-level program would be educating communities on naloxone administration for opioid overdose.

Advocacy

The role of client advocate only intensifies when caring for a population that is incarcerated. Correctional nurses must work with correctional staff to limit barriers that may affect the delivery of timely health care interventions and treatments. Advocacy also includes ensuring follow-up appointments, appropriately triaging and attending to requests for health care visits, collaborating with correctional staff and court officials to guarantee clients receive needed health services, ensuring clients have access to proper hygiene and clean housing units, and discussing with

correctional staff regarding the transfer of clients for specialized health care needs such as dialysis.

Correctional nurses serve a socially marginalized population: these justice-involved individuals have lower educational attainment, lower pre-incarceration incomes, and numerous health disparities (ANA, 2021). Mental health disparities are evident in justice-involved individuals. Lifetime trauma exposure is higher for incarcerated women and men than for individuals without a history of incarceration, and these individuals are more likely to be diagnosed with a serious mental illness or SUD (ANA, 2021). Correctional nurses can improve this population's health through treatment and education of these long-term conditions during incarceration.

Common Health Problems of Incarcerated Individuals

Given the variety of settings where correctional nursing occurs, all nurses should understand the role of the corrections nurse and be familiar with common health problems of justice-involved individuals. Members of this population who are housed in prisons have much higher rates of disease than the general population; being incarcerated is associated with early mortality (AAFP, 2021; ANA, 2021). This population experiences many common health problems due to a multitude of factors, including pre-incarceration social conditions, lack of autonomy within the system, violence within the system, overcrowding, and overall congregate living situation (AAFP, 2021; ANA, 2021; Schoenly & Knox, 2012). Common health problems among members of this population include long-term diseases, infectious diseases, reproductive concerns, mental health and SUDs, violence, and self-harm. Additionally, certain populations, such as older adults, may have age-related functional limitations like mobility or sensory impairments, making the provision of appropriate care more challenging ([Table 29.3](#)) (ANA, 2021). Some prisons and jails require copays from the detainees to access health care services, serving as a potential barrier to care, adding an additional undue burden on this vulnerable population (ACOG, 2021).

Health Condition	Percent Reporting
Cancer	12 percent
Kidney problems	12 percent
Heart disease	23 percent
Diabetes	23 percent
Arthritis	45 percent
Hypertension	62 percent

TABLE 29.3 Percentage of People in State Prison Age 55 and Older Who Report Ever Having Specific Health Conditions (See Wang, 2022.)

Long-Term Diseases

The most common long-term conditions in justice system-involved persons are hypertension, arthritis, asthma, and hepatitis (Maruschak et al., 2021), some of which are seen at much higher levels in the justice system-involved population than the overall U.S. population due to persistent health disparities.

- Almost 17 percent of justice-involved individuals aged 55 and above in state prisons have asthma, whereas the general population of adults with asthma is 8 percent (Wang, 2022).
- About 10 percent of justice-involved individuals aged 55 and above in state prisons have hepatitis C, whereas the general population is under 2 percent. Hepatitis C is a curable disease; however, 80 percent of justice-involved individuals in state prison who have ever had a diagnosis of hepatitis C still have it (Wang, 2022).
- An estimated 65 percent of the U.S. prison population has a substance use disorder compared with 16.5 percent of the general population (National Institute on Drug Abuse [NIDA], 2020; U.S. Department of Health and Human Services, 2023).

Correctional nurses need to be well versed in the care of these long-term conditions, including screening intervals, follow-up intervals after medication adjustments, and ensuring the appropriate referrals to specialty care in the monitoring for potential complications. Asthma poses challenges for clients in correctional settings due to the nature of the disease process that results in intermittent asthmatic flare-ups. Justice-involved clients need to request care through the correctional officers, which may result in a delay from when a client feels a flare-up is imminent and actual care. Some asthmatic medications are meant to be used as a "rescue" when the client is having trouble breathing. This extra layer between a client and their medications can adversely impact their overall health and disease severity. Correctional nurses must advocate for these clients appropriately and educate

correctional officers on bringing them to the nurse as soon as feasible. By being a health advocate and champion, correctional nurses can improve these individuals' health through health promotion and disease prevention activities so that when the justice-involved clients reenter society, they are in better health and know how to manage their long-term diseases.

Infectious Diseases

Infectious diseases are a major concern in correctional facilities where environmental conditions make the spread of infectious disease more likely (ANA, 2021). Nurses are on the front line in preventing infectious disease spread through screening, client education and counseling, immunizations, handwashing, isolation procedures as necessary, and monitoring treatment compliance (CDC, 2023d; Schoenly & Knox, 2012). Individuals who are justice-involved often experience numerous risk factors for HIV, hepatitis, STIs, and tuberculosis (TB) (CDC, 2023d). Like long-term diseases, the incidence of these infections and diseases is higher in the justice-involved population and are often related to pre-incarceration SDOH, such as homelessness, poor nutrition, lack of medical care, substance use, and risky sexual behaviors (AAFP, 2021; CDC, 2023d; Schoenly & Knox, 2012). The corrections nurse will likely identify, treat, and manage these conditions and help limit their spread through client education and reinforcement of risk-reduction practices (CDC, 2023d; Schoenly & Knox, 2012). Justice-involved individuals incarcerated in state or federal prisons had the following rates of infection in 2021 (CDC, 2023d):

- 3 times higher rate of HIV
- 10 times higher rate of hepatitis C virus and between 3 to 38 times higher rate of hepatitis B virus
- Higher rates of chlamydia and gonorrhea
- 6 times higher rate of TB
- Rate of COVID-19 infection estimated to be 5.5 times higher among individuals who are incarcerated (LeMasters et al., 2022)

The CDC (2023k) recommends screening all individuals at intake for HIV, hepatitis B virus (HBV), hepatitis C virus (HCV), TB, gonorrhea, chlamydia, and syphilis. As of 2021, 16 states conducted mandatory HIV testing under state law, and 23 states and the FBOP offer opt-out HIV testing where individuals are informed that they will be tested for HIV unless they decline the screening (CDC, 2023d).

The CDC also recommends the following primary prevention measures (2023k):

- Beginning the hepatitis A vaccine series for all previously unvaccinated juveniles under 18 and all adults at increased risk for hepatitis A infection, such as men who have sex with men, those who use IV drugs, and individuals experiencing homelessness
- Beginning the hepatitis B vaccine series for juveniles and adults not previously vaccinated

Correctional nurses are also a part of the care team during transitions when the justice-involved client will be leaving the correctional facility. The nurse must ensure the client is linked with a community-based provider for continued care, especially with HIV, hepatitis, and TB as a public health prevention measure (CDC, 2023c).

At the height of the COVID-19 pandemic, justice-involved clients living in correctional facilities were at increased risk for COVID-19 for the same reasons they are at increased risk for other infectious diseases; congregate living arrangements and higher prevalence of comorbid medical conditions placed them at higher risk for infection (CDC, 2023f; LeMasters et al., 2022). The CDC (2023f) continues to recommend intake testing for COVID-19 as an enhanced prevention strategy. The CDC has released [updated guidance \(<https://openstax.org/r/archivecdc>\)](https://openstax.org/r/archivecdc) on assessing a facility's risk for COVID-19 and enhanced prevention strategies for everyday operations. For more information on COVID-19, see [Pandemics and Infectious Disease Outbreaks](#).

CASE REFLECTION

Correctional Nursing Intake Interview

Read the scenario, and then respond to the questions that follow.

Jason, a correctional nurse employed in a state prison, is completing the initial intake for a client who is new to the prison system. The client, Rory, is a 23-year-old woman with a past medical history of asthma, bipolar disorder,

substance use disorder, and a prior suicide attempt. She reports she was in an abusive relationship that ended about 9 months ago and resulted in her experiencing homelessness. She has been sleeping outside as she had a negative encounter at the shelter on her first night there 9 months ago. She does not wish to go into further detail but reports she started using IV heroin while on the streets about 6 months ago.

1. What screenings should Jason recommend for this client?
 2. Given Rory's social and medical background, what health issues is she at risk for?
 3. What are Jason's priority actions at this time?
 4. How can Jason build rapport and a therapeutic relationship with this client?
-

Reproductive Health Care

Women are the fastest-growing segment of the incarcerated population, comprising 10 percent of those incarcerated in 2019 (ACOG, 2021). The majority of justice-involved women are parents and of reproductive age. According to the ACOG (2021), reproductive health care for justice-involved individuals should be provided with the same guidelines and recommendations as for the general population, paying particular attention to the increased risk of infectious diseases and mental health conditions. The corrections nurse is an advocate, educator, and leader when advising detention facilities on guidelines and protocols to address comprehensive reproductive health and pregnancy needs. This includes contraception management, cervical and breast cancer screening, and holistic maternity care with the promotion and support of breastfeeding (ACOG, 2021).

Additionally, the corrections nurse needs to advocate at the organizational, local, state, and federal levels to support and push for the elimination of copays to access health care while in custody; to restrict shackling during pregnancy, labor, and the postpartum period; and to ensure adequate menstrual products are available at no cost (ACOG, 2021). The nurse should foster an appropriate birthing environment for justice-involved individuals who give birth while in custody and allow them to have the same opportunity to bond with their newborns. ACOG strongly urges all health professionals within corrections to advocate fiercely against placing pregnant clients in restrictive housing and for community-based alternatives to incarceration in this population, as incarcerated pregnant individuals have higher risks of adverse perinatal outcomes (ACOG, 2021; ANA, 2021).

Women who are incarcerated have higher rates of previous sexual and physical abuse than the general population. Therefore, the nurse must be trained to provide trauma-informed care (TIC) for these clients (ANA, 2021). When assisting health care providers with pelvic examinations, acknowledging that this procedure may be re-traumatizing to some clients and, as such, unnecessary. Nurses can be a chaperone to the health care provider performing the pelvic examination. They should also advocate that correctional officers not be present for these sensitive exams (ACOG, 2021). Research has demonstrated that justice-involved women have higher rates of gynecological conditions, such as irregular menstrual bleeding and vaginal discharge, than the general population of women. Long-term stressors related to poor social conditions in their pre-incarceration lives, such as unstable housing and exposure to trauma and violence, may influence abnormal menstrual bleeding, affecting up to 40 percent of these women (NCCHC, 2020). For transgender individuals, continuing hormone therapy and enabling access to gender-affirming care is key to providing comprehensive health care (ACOG, 2021).

Rates of breast and cervical cancers are higher among justice-involved women than among the general population, likely related to a lack of screening before and during custody (NCCHC, 2020). Many cervical cancers are preventable with appropriate screening, such as Pap smears and human papillomavirus (HPV) testing. National guidelines recommend females ages 21 to 29 get screened every 3 years, and those ages 30 to 65 get screened every 3 to 5 years. HPV vaccination is recommended through age 26, and this can be started while in custody (NCCHC, 2020). Guidelines for screening mammograms should follow appropriate national guidelines. The correctional nurse needs to be able to follow up on any abnormal Pap or mammogram results, which can be difficult during times of transition. Therefore, ensuring clients are connected with community health providers upon release is a key component of correctional nursing (NCCHC, 2020).

Among justice-involved women, rates of SUD, prior trauma and abuse, mental illness, and STIs are higher than the general population and higher than justice-involved men. The disproportionate rate of these conditions in women results from their intersection with the SDOH and, in BIPOC justice-involved women, structural racism as well (AAFP, 2021; ACOG, 2021; NCCHC, 2020). Additionally, the prevalence of trauma and sexual, physical, or emotional abuse in justice-involved women was as high as 90 percent in one study, indicating just how commonplace trauma

and violence are among these women (NCCHC, 2020). Correctional nurses should be trained in trauma-informed care and should screen all women for trauma history to identify those needing resources and treatment (NCCHC, 2020). [Caring for Vulnerable Populations and Communities](#) discusses TIC in more detail.

Mental Health

According to the NAMI (2021), two out of every five individuals who are incarcerated have a history of mental illness, twice the number in the overall U.S. population. The origins of this disproportionate burden date to the mid-1950s when mass deinstitutionalization from mental institutions occurred (Roth, 2021). At the height of mass institutionalization in 1955, half a million people lived in state-run psychiatric facilities (Roth, 2021). In 1963, President Kennedy signed the Community Mental Health Act (CMHA) into law; the goal was to decrease the number of institutionalized individuals by supporting and nurturing self-sufficient local mental health care centers within communities (Erikson, 2021). This made federal grants available to states to establish these community mental health centers to care for clients released from state hospitals. During this time, Medicaid was introduced, shifting funding for individuals with severe mental illness from state-funded and run hospitals to a shared partnership with the federal government (Yohanna, 2013). This incentivized states to close facilities and move these clients with severe mental illness into community-based centers, hospitals, and nursing homes partially funded by Medicaid and the federal government (Yohanna, 2013). Few community mental health centers were built, resulting in a shortage of mental health care (Roth, 2021). Mass deinstitutionalization and the unmet needs of individuals with mental illness often resulted in initial criminal justice issues and subsequent recidivism (ANA, 2021; Roth, 2021).

NAMI POLICY PRIORITIES: MENTAL HEALTH TREATMENT WHILE INCARCERATED

[Access multimedia content \(<https://openstax.org/books/population-health/pages/29-3-correctional-nursing>\)](#)

This video highlights the intersection between individuals with mental illness and incarceration. Mental illness is often not treated while individuals are incarcerated, resulting in unnecessary suffering and higher rates of suicide while incarcerated. NAMI supports public policies and laws to expand and improve access to mental health care within prison and jail settings.

Watch the video, and then respond to the following questions.

1. What is the relationship between mental illness and incarceration?
2. What are some alternatives to jail for individuals who have severe mental illness?

The correctional health system consistently underperforms in providing mental health care to individuals who are incarcerated (Roth, 2021). As law enforcement and courts treat mental illness like a crime, prisons and jails have more and more individuals with severe mental illness who are not being treated appropriately ([Figure 29.6](#)) (Wang, 2022). In a report from 2016, despite 56 percent of the state prison population having a mental health problem, only one-quarter of these individuals received professional mental help (Wang, 2022). The most common disorders are post-traumatic stress disorder, depression, bipolar disorder, and psychotic disorders such as schizophrenia (Aufderheide, 2014). The rates of most of these disorders are almost 3 times as high in women as in men (NCCHC, 2020; Wang, 2022). In prisons and jails, two-thirds of women had a history of a mental health diagnosis compared with 35–40 percent of men. There is a higher risk for attempted and completed suicide in the incarcerated population than in the general population (Hahn, 2022). In adolescents, suicide attempts are four times higher in justice-involved adolescents than in the general population (ANA, 2021). Correctional nurses must consider suicide potential during the intake of new justice-involved individuals into a facility and in all incarcerated persons, especially when there are threats of violence while incarcerated (Schoenly & Knox, 2012.)

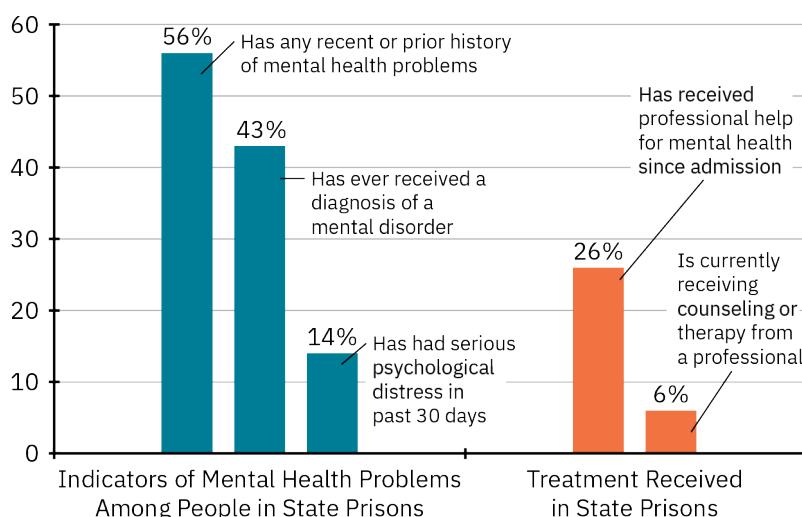

FIGURE 29.6 The extent of mental health problems in justice-involved individuals does not match the mental health help provided to these individuals. Over half of people in state prisons have reported a mental health issue, but only one in four has received professional help while incarcerated. (See Wang, 2022; data source: Maruschak et al., 2021; attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

Mental illness is common among justice-involved individuals, so correctional nurses need to be able to identify and care for clients with mental health problems. Understanding the implications of mental illness and comorbidity with other conditions, monitoring for drug interactions, and managing side effects are key aspects of correctional nursing care. A 2016 survey found that approximately 50 percent of individuals incarcerated in state prisons with a history of a substance use disorder also had a history of one or more mental health conditions, compared with only 38 percent of the general U.S. population with a history of a substance use disorder (Wang, 2022).

Substance Use

According to the NIDA (2020), an estimated 65 percent of the incarcerated population has an active SUD; an additional 20 percent was under the influence of drugs or alcohol at the time of their crime. Alcohol and drug withdrawal is a major concern for correctional nursing, along with health promotion activities designed to assist justice-involved clients in developing alternative coping mechanisms to reduce recidivism (Schoenly & Knox, 2012).

Although the incidence of opioid use disorder (OUD) in criminal justice settings is high and treatment of SUDs within the criminal justice system has been shown to make a difference in outcomes for affected individuals, most correctional facilities do not offer any medication to treat individuals with OUD (NASEM, 2019; NIDA, 2020). Appropriate treatment and counseling can change attitudes, beliefs, and behaviors toward drug use, decreasing opioid use and criminal activity once a person is released from prison (NIDA, 2020). Overdose deaths post-incarceration are lower when justice-involved individuals receive treatment and medications for addiction while incarcerated (NIDA, 2020). According to the National Academies of Sciences, Engineering, and Medicine (NASEM, 2019), medication-based treatment for SUD is effective across all settings and withholding approved medications—methadone, buprenorphine, and naltrexone—for the treatment of OUD in criminal justice settings amounts to blocking medical treatment.

The lack of medication-based treatment for these individuals results in a greater risk of returning to use and overdose post-incarceration, with a high risk of mortality following release (NASEM, 2019). Justice-involved individuals were more likely to engage in treatment post-incarceration and less likely to use illicit drugs 6 months out when they initiated medication-based treatment within the prison system (NASEM, 2019). There are ethical implications because withholding medications to treat OUD is associated with adverse outcomes for the individual and the community (NASEM, 2019). Another consideration with this population is the care transitions that occur upon release. Many justice-involved individuals are not adequately transitioned or even referred to outpatient medication-based treatment upon release (NASEM, 2019).

CORRECTIONAL HEALTH CARE

[Access multimedia content \(<https://openstax.org/books/population-health/pages/29-3-correctional-nursing>\)](https://openstax.org/books/population-health/pages/29-3-correctional-nursing)

In this video, nurses describe the role of the correctional nurse and explain why they consider it to be the hidden gem of health care.

Watch the video, and then respond to the following questions.

1. What did you think of correctional health nursing before you read this chapter and watched this video?
What do you think of it now? How has your perspective on corrections nursing changed, if at all?
2. What, if anything, about the role of correctional nurse surprised you?

CASE REFLECTION

Correctional Nursing

Read the scenario, and then respond to the questions that follow.

As introduced previously, Rory is a 23-year-old woman who completed her initial health intake with nurse Jason two months ago when she first arrived in state prison. At that initial intake, Rory underwent many screening tests, including STI testing and pregnancy testing. Rory tested positive for chlamydia, hepatitis C, and pregnancy. She was treated with antibiotics for chlamydia and started on a prenatal vitamin for her pregnancy. The medical facility also ordered asthma medications, a steroid inhaler, and a rescue inhaler for Rory. Rory went through active detox after admission because the state facility does not offer medication-based treatment for her opioid use disorder. She has yet to have her bipolar disorder evaluated or treated by the health care team but is scheduled to see the nurse midwife for her first obstetric visit next week. Rory's scheduled release date is in 11 months.

1. What is the role of the correctional nurse in caring for this client?
2. Given this client is pregnant, how should the correctional nurse approach the upcoming nurse midwife visit?
What can the nurse do to help the client prepare for it?
3. How can the nurse assist this client with receiving treatment for her mental health diagnosis?
4. What is this client at risk for upon discharge? How can the correctional nurse assist Rory as she plans for discharge in less than a year?

29.4 Public Health Nursing and Public Health Departments

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 29.4.1 Examine the structure and organization of local and state public health agencies in the United States.
- 29.4.2 Identify how state and local public health departments are financed.
- 29.4.3 Differentiate between the functions of state and local health departments.
- 29.4.4 Delineate how public health differs from other practice areas across the continuum of care.

Public health nursing promotes and protects a population's health by synthesizing knowledge from nursing, social, and public health sciences and applying it for **social betterment** (ANA, n.d.; ANA, 2022). Social betterment was a term first used in 1912 by Lillian Wald, often considered the first public health nurse in the United States, to describe the role of public health nurses (PHNs) in addressing the upstream determinants of health—the places where people live, work, learn, play, and worship (ANA, 2022). Public health nursing in the United States is grounded in ensuring the circumstances and environment in which health equity and well-being for populations can be attained by minimizing health disparities for all (ANA, 2022). This nursing specialty is a population-based practice with a focus across multiple levels—individuals, families or small groups, communities, and systems within the overall context of the community as a whole (ANA, 2022).

BAPTISM OF FIRE – HENRY STREET SETTLEMENT

[Access multimedia content \(<https://openstax.org/books/population-health/pages/29-4-public-health-nursing-and-public-health-departments>\)](https://openstax.org/books/population-health/pages/29-4-public-health-nursing-and-public-health-departments)

This video highlights Lillian Wald's work with vulnerable populations in New York City in the late 1890s and early 1900s. Wald and her colleagues provide a great example of how public health nursing positively impacts the lives of individuals, families, and communities and how advocacy can alter federal policies and laws.

Watch the video, and then respond to the following questions.

1. Why were the efforts of the reformers called the “settlement movement”?
2. How does Lillian fulfill the role of the public health nurse?
3. What surprised you most about Lillian’s work in public health?

PHNs use all levels of prevention with an emphasis on primary prevention and a focus on improving health outcomes by addressing the SDOH, particularly the physical and the environmental determinants of health. Health equity, social justice, and environmental justice are highlighted as pillars of public health nursing (ANA, 2022). Refer to [Foundations of Public/Community Health](#) for more details on the role of public health nursing. The United States has a complicated public health system composed of individuals, government workers, and organizations in both the public and private sectors collaborating in various ways at the local, state, and national levels (Public Health Law Center [PHLC], 2015). This section explains different types of public health governance structures, explores public health funding, and compares the roles of the state and local health departments.

Public Health Governance Structures

The government public health sector comprises federal, state, the District of Columbia, and local and tribal public health agencies. There are almost 3,000 local governments and over 500 federally recognized tribal agencies. States have leeway in defining their public health role, resulting in national variability (PHLC, 2015). Just as states have the leeway to define their role in public health, there is no uniform public health governance structure. Although the governance structures of state health departments (SHDs) vary from state to state, the relationships between SHDs and local health departments (LHDs) also vary widely. The following are four general types of governance health structures between SHDs and LHDs (CDC, 2022g; Leider et al., 2018; PHLC, 2015):

- Centralized
 - LHDs are units of the state government and led by state employees.
 - SHDs manage LHDs as divisions of the SHD.
- Decentralized
 - LHDs are led by local governments and the employees of local governments.
 - Local governments make most of the financial decisions in this model and keep more power and accountability for delivering public health services.
- Mixed
 - Some LHDs are led by the state government and some by the local government.
 - In this model, generally LHDs keep more power and accountability for delivering public health services.
- Shared
 - LHDs may be led by state employees or by employees of local governments.
 - If led by state employees, the local government can make financial decisions and issue public health orders. If led by local government employees, then the state has the authority.
 - In this model, generally LHDs keep more power and accountability for delivering public health services.

The Association of State and Territorial Health Officials ([ASTHO](https://openstax.org/r/astho)) interactive dashboard gives detailed information on each state's and each region's public health agency structure. ASTHO first reported data in 2007 and updates data every 2 to 3 years, defining the scope of state and territorial public health services, identifying the variations in practice among states and territorial agencies, and representing the work overseen by the various health agencies nationwide. On an individual state level, the ASTHO website outlines the governance structure, workforce, and finance structure, affording the public an understanding of how their state public health departments function (ASTHO, 2023).

State Health Departments

The CDC is the federal government organization charged with population health protection and improvement

activities (Leider et al., 2018). Other federal agencies with public health functions include the U.S. Department of Health and Human Services (HHS), the Health Resources and Services Administration (HRSA), the Food and Drug Administration (FDA), the Substance Abuse and Mental Health Services Administration (SAMHSA), and the National Institutes of Health (NIH) (Leider et al., 2018). Although the CDC has set a federal public health agenda, much of the oversight of public health is left to individual states. The structure of state-level public health varies. State health agencies are tasked with implementing federal regulations or policies, such as Medicaid, Medicare, and the Children's Health Insurance Programs (Leider et al., 2018).

Within the United States, about 55 percent of SHDs are independent, whereas the other 45 percent are organized as one unit of a larger health-related agency that includes mental health services, long-term care services, public assistance, and traditional public health functions (PHLC, 2015). Each state's health department is usually the primary public health authority and supports delivering public health services. A council or board of health often oversees and directs SHDs. These boards often advise elected officials on PH matters, develop state PH policies, and develop legislative PH agendas. State legislatures approve state PH agency budgets, establish PH laws and regulations, determine fees for health services, and establish taxes to support public health. State PH agencies are often influenced by the elected officials in the state (PHLC, 2015).

Public health system funding is difficult to generalize as the structure of the public health system is determined by how state and local health departments are empowered within a state with much variation across the nation (Leider et al., 2018). SHDs receive both federal and state funds. Alternate funders are foundations and for-profit institutions (Leider et al., 2018). The federal government is the largest funder of state public health. Federal agencies will provide funds for particular diseases or programs, which can decrease the public health program's ability to respond to local needs and priorities (Leider et al., 2018). Public health systems for territories and tribal nations are funded externally by the federal government. They tend not to have a distinct public health operation as they integrate population-oriented services with direct health care services (Leider et al., 2018).

Local Health Departments

Local health departments obtain authority from the state. Their roles and scope of authority are contingent on state policy and the governing relationship between the state and LHD. As noted previously, the role and governing structure of LHDs vary widely. Some LHDs provide direct clinical care, whereas others focus solely on population-based services (Leider et al., 2018). Some LHDs in large cities have functional abilities similar to those of SHDs, although small LHDs often provide a limited set of public health services. LHDs can be designed as locally governed, a branch of the state health department, a state-created region, or a department serving multiple counties. The commonality is that LHDs have governmental power and are responsible for public health at the local level (PHLC, 2015). They are also responsible for following state laws and regulations (Leider et al., 2018).

The National Association of County and City Health Officials (NACCHO) estimates there are 2,800 LHDs in the United States of varying size and complexity (Leider et al., 2018). Spending estimates for LHDs are complicated and not readily available as they are self-reported by the nation's LHDs and capture only basic information such as revenues and expenditures. LHDs are often supported by cities, counties, and local governments, partially financed through local property taxes or via a devoted public health revenue stream from the local government (Leider et al., 2018). Local government support of public health agencies averages about 3 percent of total local taxes (Leider et al., 2018). Some state legislatures fund LHDs through grants and contracts managed by the SHD. The federal government will also support some large local governments with grants, but most often federal dollars go to SHDs first to then be further disbursed to LHDs (Leider et al., 2018).

Trends in Public Health Funding

Public health is chronically underfunded with fragmented infrastructure (Johns & Rosenthal, 2022; Leider et al., 2018). Historically, public health is deeply siloed with funding dedicated to specific diseases or focal areas and allocated across many entities in the public health system. State and local health departments fund and conduct public health activities. The federal government provides additional funding through its various branches, with the CDC being the primary funder, yet the CDC's funding decreased by more than 8 percent between 2010 and 2021 (Johns & Rosenthal, 2022). Federal contributions have remained stagnant, resulting in state and local funding sources compensating for the lack of increased funding. This has created an inequitable system, as each locality has different funding sources (Johns & Rosenthal, 2022). Due to these funding differences, there are also significant differences in local public health services nationwide.

Public health spending increases of as little as \$10 per capita have been linked to decreased mortality rates of as much as 7 percent and an overall greater percentage of the population reporting being in good or excellent health (Johns & Rosenthal, 2022). Similarly, decreases in low birth weight, rates of STIs, and foodborne illnesses have been directly linked to spending on public health initiatives (Johns & Rosenthal, 2022). Investments in public health can offload some of the burden on the U.S. health care system. In 2019, less than 3 percent of the overall \$3.8 trillion spent on health care in the United States went toward public health (Johns & Rosenthal, 2022). This mirrors the finding that, over the past two decades, between 2 and 3 percent of health spending went directly to public health. Health care costs are increasing, with most of the spending going toward treating preventable conditions, yet population health in the United States continues to decline. For every \$1 spent on public health interventions focused on diabetes and cardiovascular health, \$5 in health spending is saved (Johns & Rosenthal, 2022).

Functions of Public Health Agencies

States have autonomy in public health efforts promoting population health. In centralized governance structures, LHDs are a subsidiary of the SHD and follow the direction of the SHD in their efforts to protect and promote the health of residents. In decentralized governance structures, LHDs have autonomy in public health efforts to promote the safety and well-being of constituents. Since both SHDs and LHDs are tasked with promoting and protecting the health of residents in their districts, they may have overlapping roles.

Role of State Health Departments

State health departments have a variety of responsibilities within public health that include the governance functions of policy development, resource stewardship, legal compliance, partner engagement, continuous improvement, and oversight (PHLC, 2015).

- Policy development
 - Contribute to developing policies to protect, promote, and improve public health.
 - Ensure the agency is consistent with laws, rules, and regulations.
- Resource stewardship
 - Ensure the availability of necessary resources to implement the essential public health services. These resources may include finances, workforce, legal support, and technology.
- Legal compliance
 - Exert legal authority as needed in the roles, responsibilities, and functioning of the governing body, health officers, and staff.
- Partner engagement
 - Develop and fortify community partnerships through engagement and education.
 - Ensure teamwork and partnership among all relevant partners in promoting the community's health.
- Continuous improvement
 - Evaluate and monitor progress regularly.
 - Set measurable outcomes used to monitor the health status of the community.
 - Assess the health agency's ability to meet its responsibilities.
- Oversight
 - Accept responsibility for public health performance in the community.
 - Provide supervision and guidance as needed to support the agency in meeting established outcomes.

State health departments provide population-based public health services focusing on prevention—primary, secondary, and tertiary. SHDs promote health and well-being by ensuring access to health care services, focusing on prevention and health equity, and by ensuring water and food safety, ensuring children have access to all childhood vaccines, and overseeing the health care-related professions and services (Commonwealth of Massachusetts, 2023a). The box below presents the typical duties of state health departments.

COMMON STATE HEALTH DEPARTMENT DUTIES

- Epidemiological disease surveillance and data collection
- State laboratory services
- Preparedness and response to public health emergencies
- Population-based health promotion and prevention strategies
 - Vaccine order management and inventory distribution
 - Tobacco cessation support
 - HIV and AIDS education on prevention, screening, and management
 - STI education, counseling, screening, treatment, and partner notification
 - Nutrition education
 - Physical activity education
- Direct health care services
- Regulation of health care providers and other licensed professionals
- Environmental health
- Technical assistance and training

(See PHLC, 2015.)

Role of Local Health Departments

LHDs coordinate public health activities in their jurisdiction and follow the SHDs rules and regulations. The responsibilities are diverse and will vary depending on state law (Commonwealth of Massachusetts, 2023b; PHLC, 2015). They may include:

- Monitoring the health status of the community
- Understanding health issues facing the community
- Protecting the community from health problems and hazards
- Educating the community on a variety of health topics to assist them in making healthy choices
- Engaging the community in identifying and addressing health problems
- Developing public health policies and plans
- Enforcing public health laws and regulations
- Assisting community members in accessing health services
- Maintaining a competent public health workforce
- Evaluating and improving programs and interventions
- Enforcing state sanitary, environmental, housing, and health codes

LHDs are involved in many activities designed to keep communities safe and healthy. There are more than 3,000 LHDs across the nation, and these city, county, and tribal departments work to ensure the safety of food, water, and air, among many other activities (NACCHO, 2017). Examples of activities include immunizations, food safety, infectious disease control, long-term disease service, injury and violence prevention, tobacco control, emergency preparedness, maternal and child health, and environmental health (NACCHO, 2017).

Role of the Public Health Nurse

PHNs serve many roles across the public health spectrum and constitute the largest portion of the professional public health workforce (Association of Public Health Nurses [APHA], 2022). PHNs can meet the needs of a variety of clients, especially more vulnerable populations, due to a strong clinical nursing background and knowledge from both the public health and social sciences (APHA, 2022). Current PHN practice is moving toward public health work across disciplines to address the SDOH and improve community health by advancing a culture of health (ANA, 2022b). The Robert Wood Johnson Foundation created the Culture of Health in 2013 to improve all individuals' health and well-being. It aligns with the public health nurse's role in advancing health equity and strengthening the integration of health services and health systems by fostering cross-sector collaboration (ANA, 2022b).

Public health nursing is a specialty with roots in the sciences of nursing and public health. It focuses on population health at the community and systems levels, emphasizing health promotion, disease prevention, and risk reduction.

Note that the work setting is not the defining characteristic of public health nursing; instead, it is the focus on population health and partnering with populations in communities as the foundation of public health nursing practice (ANA, 2022b). Examples of the PH nursing role may include:

- Conducting health screenings such as blood pressure, weight, and depression
- Leading group coaching sessions to assist individuals in setting SMART (specific, measurable, attainable, realistic, and timebound) personal health goals
- Overseeing mass vaccination clinics
- Designing outreach activities (such as addressing vaccine hesitancy) to vulnerable communities
- Partnering with disaster relief agencies to assist individuals in accessing clean water and safe food
- Managing directly observed therapy for active tuberculosis cases
- Advocating for the needs of complex medical care clients within the community
- Visiting community members in their homes to provide direct clinical care services

Public health nursing can be practiced in any location with a population of people:

- Health departments
- Schools
- Community health centers
- Visiting nursing
- Health clinics
- Correctional facilities
- Occupational work sites
- Mobile vans
- Tribal government agencies
- Churches or other faith-based programs
- Rural health care
- Refugee and immigrant clinics
- Primary care clinics
- Ambulatory outpatient facilities
- Voluntary organizations
- Homeless shelters

The primary role of the PHN is to promote, protect, and improve the health and welfare of the public. PHNs develop, deliver, and evaluate services and programs that focus on the health of populations while collaborating with many entities and serving as a safety net for vulnerable populations (ANA, 2022b).

PUBLIC HEALTH NURSING: A CAREER WITH MEANING

[Access multimedia content \(<https://openstax.org/books/population-health/pages/29-4-public-health-nursing-and-public-health-departments>\)](https://openstax.org/books/population-health/pages/29-4-public-health-nursing-and-public-health-departments)

This short video highlights the role of the public health nurse.

Watch the video, and then respond to the following questions.

1. One nurse in the video says that public health nurses look at health in a holistic way. What does this mean?
2. When making home visits, public health nurses enter a client's "space." What are some possible challenges with caring for clients in their homes? What are some benefits?

Public health departments help build and maintain healthy communities, states, and the nation. Every 10 years, the Department of Health and Human Services' Healthy People goals and targets establish the nation's health improvement priorities. By supporting policy, advocacy, and education, nursing has a great impact on public health especially in the areas of immunizations, infection prevention, environmental health, and the response to the opioid crisis (ANA, n.d.). PHNs have the knowledge, skills, and leadership abilities to promote a culture of health by improving the health of individuals, families, and communities and heeding the call of The National Academy of Medicine's report, *The Future of Nursing 2020-2030: Charting a Path to Achieve Health Equity* (ANA, 2022).

 **THE SPIRIT OF HEALING: FAITH COMMUNITY NURSING**

[Access multimedia content \(<https://openstax.org/books/population-health/pages/29-4-public-health-nursing-and-public-health-departments>\)](https://openstax.org/books/population-health/pages/29-4-public-health-nursing-and-public-health-departments)

Faith-based nursing, also known as parish nursing or faith community nursing, focuses on the client's spiritual care to prevent or minimize illness and promote holistic health care (Galan, 2023). The purpose of this specialty is to nurture the human spirit with health education and spiritual support while connecting the client to resources within the congregation or faith community.

Watch the video, and then respond to the following questions.

1. What is the relationship between the role of faith-based or faith community nursing and community health?
2. What roles did you see these faith-based nurses taking in the care of their clients?
3. How did the relationships that the parish nurse cultivated with her clients empower the clients to take action to promote their own health and well-being?

Chapter Summary

29.1 Occupational Health

Occupational and environmental health nursing focuses on providing preventive health care, health promotion, and health restoration in a safe and healthy work environment. OHNs require specialized competencies depending on the industry; however, the scope of practice has common overarching concepts of community health, law, economy, politics, policy, and regulatory issues. OSHA creates and enforces workplace safety standards to ensure safe and healthy conditions for workers. NIOSH is the research agency tasked with studying worker safety and health. NIOSH provides evidence for many of the standards that OSHA enforces. OHNs' roles include clinician, educator, case manager, corporate director, consultant, and researcher with diverse work settings including hospitals, academia, government, military, and industrial factories.

29.2 School Health

School nursing protects and promotes student health by facilitating optimal development and academic success. School nurses are health care and education leaders who advocate for student-centered care, coordinate care, and collaborate with school administrators, staff, teachers, families, and the interprofessional health care team. They are change agents, improving the health of children, families, and communities. Roles include clinical care provider, health educator, and advocate. Two established frameworks, the *Framework for 21st Century School Nursing Practice* and the *Whole School, Whole Community, Whole Child Model*, guide school nursing practice. Common health concerns the school nurse encounters are asthma, diabetes, epilepsy, food allergies and anaphylaxis, obesity, oral health issues, behavioral problems, learning difficulties, teen pregnancy, STIs, and substance misuse.

Key Terms

correctional nursing providing nursing care to clients within the criminal justice system, jails, prisons, juvenile detention centers, and substance-misuse treatment centers

ergonomics a set of practices, such as adjustable desk heights and keyboards that more naturally fit the wrist's contours, in workplaces that increase worker efficiency and productivity while reducing injuries and discomfort

29.3 Correctional Nursing

Correctional nursing provides care to clients in the criminal justice system, jails, prisons, juvenile detention centers, and substance-misuse treatment centers. Correctional nurses must defer to correctional officers and safety protocols. They use a broad range of nursing skills to care for individuals across the justice system, including incarceration, probation, parole, treatment programs, individuals housed in immigration and customs facilities, and those transitioning between settings. They perform many roles in various settings, such as restricted housing, primary care clinics, urgent care clinics, inpatient infirmaries, community-based facilities, and palliative and hospice care settings. Correctional nurses provide care related to substance misuse, sexual abuse, long-term health conditions, infectious diseases, reproductive care, mental health, and transitional services such as medication management, health promotion screening, and teaching.

29.4 Public Health Nursing and Public Health Departments

Public health nursing promotes and protects a population's health by synthesizing knowledge from nursing, social, and public health sciences and applying it for social betterment. The government sector of public health includes public health agencies at the federal and state levels, including the District of Columbia, with almost 3,000 local governments and over 500 federally recognized tribal agencies. SHDs' responsibilities include policy development, resource stewardship, legal compliance, partner engagement, continuous improvement, and oversight. SHDs provide population-based public health services focusing on primary, secondary, and tertiary prevention. LHDs' roles and scope of authority are contingent on state policy and their governing relationship with the state. LHDs coordinate public health activities in their jurisdiction and follow the SHDs' rules and regulations.

individual health plan (IHP) a plan used by schools that outlines what to do if a student has a medical event while at school; serves as an agreement between the school and the student, outlining the student's needs and the plan to address them

industrial health nursing the term used for occupational health nursing in the late 1800s and early 1900s

justice-involved individuals who are involved with

the criminal justice system in jails, prisons, juvenile detention centers, and substance misuse treatment centers

Nurse Practice Act the state's governing law that determines the scope of practice of nursing that school nurses must follow

occupational and environmental health nursing a specialty practice focused on providing preventive health care, health promotion, and health restoration within the setting of a safe and healthy environment

public health nursing the discipline of promoting and protecting a population's health by synthesizing knowledge from nursing, social sciences, and public health sciences and applying it for social betterment

restricted housing a type of detention that includes voluntary or involuntary removal from the general incarcerated population with placement into a locked cell or room for an extended period of time

Review Questions

1. What is the most appropriate intervention for the school nurse to implement to promote a healthy school environment?
 - a. Advocate for nutritious school lunch programs
 - b. Provide care for children with asthma
 - c. Develop individualized health plans
 - d. Educate students and families about screening for scoliosis

2. Which action should the school nurse perform to address dental health at the community level?
 - a. Educate caregivers of children with dental caries about oral health
 - b. Advocate for fluoridation of drinking water
 - c. Assist caregivers with finding dental resources for children without dental insurance
 - d. Teach children in school how to floss properly

3. Which function would the public health nurse perform while working at a local health department?
 - a. Teaching a client how to self-inject insulin
 - b. Implementing Medicaid regulations
 - c. Educating a community about influenza vaccinations
 - d. Regulating the Children's Health Insurance Programs (CHIPs)

4. What principle of correctional health care did the 1976 ruling in *Estelle v. Gamble* establish?
 - a. Accreditation for correctional health care facilities
 - b. Health information privacy for individuals in custody
 - c. Autonomy over health care decisions for incarcerated people
 - d. The provision of health care for incarcerated people

5. Which concept should the nurse use when providing care for individuals who are incarcerated?
 - a. Education levels of the incarcerated population are the same as the general population.
 - b. There is a lack of privacy when caring for incarcerated people.
 - c. Therapeutic nurse-client relationships are not utilized in correctional nursing.
 - d. Most incarcerated people are middle-age or older adults.

6. Which intervention can the nurse implement to reduce the spread of infectious disease in a correctional

root cause analysis (RCA) a component of an incident investigation that is used to identify, evaluate, and correct the causes of accidents

school nursing a nursing specialty with a focus on protecting and promoting student health by facilitating optimal development and promoting academic success

social betterment the role of public health nursing in addressing the upstream determinants of health—the places where people live, work, learn, play, and worship

standard a regulatory requirement established by the agency that serves as criteria for evaluating whether employers are following OSHA laws (a.k.a. regulation)

Total Worker Health® (TWH) policies, programs, and practices that focus on work-related safety and protection

facility?

- a. Encouraging daily handwashing
- b. Asking about HIV status at intake to a correctional setting
- c. Questioning people about sexual practices
- d. Advocating for vaccination for hepatitis A and hepatitis B

7. A school nurse is preparing a presentation to the school board on the scope of practice of the school nurse.

Which information will the nurse present?

- a. The school district's job description for the school nurse overrides the Nurse Practice Act.
- b. The Nurse Practice Act is a state law that determines the scope of practice for the school nurse.
- c. The scope of nursing practice for the school nurse is the same in every state.
- d. The state medical board decides the scope of practice for the school nurse in each state.

8. Which action by the occupational health nurse is a secondary prevention activity?

- a. Screening for hearing loss
- b. Conducting safety inspections of work areas and facilities
- c. Educating employees to wear eye protection
- d. Completing a physical assessment after an injury

9. Which workplace condition will the occupational health nurse include when teaching factory employees about ergonomic hazards?

- a. Repetitive motions
- b. Infectious agents
- c. Noise levels
- d. Cleaning solutions

10. Which activity would the correctional nurse implement to address tertiary health promotion in individuals with long-term disease who are incarcerated?

- a. Teach rescue inhaler use for people with asthma
- b. Administer medication for the treatment of hepatitis C
- c. Advocate for low-sodium dietary options for people with hypertension
- d. Recommend physical therapy for people with arthritis

CHAPTER 30

Care Transition and Coordination Across the Community

FIGURE 30.1 A health care provider listens to the client to gather information to aid in care coordination. (credit: modification of work by Scott Housley/CDC, Public Domain)

CHAPTER OUTLINE

30.1 The Effects of Care Coordination and Care Transitions on Outcomes

30.2 Care Transition Models

30.3 Role of the Community Health Nurse

INTRODUCTION Mrs. Johnson is a 72-year-old client with multiple chronic conditions, including diabetes, hypertension, and heart failure, living in a rural community. After a hospital stay during which she received appropriate medical interventions for exacerbation of heart failure and experienced symptom improvement, Mrs. Johnson has been discharged from the hospital and is going home. The nursing role in the transition from hospital to home is to ensure the client is safe and continues to receive the necessary care and support they need. Ensuring a smooth transition from hospital to home is critical in preventing readmissions and promoting the health and well-being of clients. Nurses play a central role in making this process as seamless as possible.

Transitions of care and care coordination are pivotal in the delivery of high-quality, client-centered care in the community. **Transition of care** refers to the movement of clients from one health care setting to another or from one level of care to another. **Care coordination** involves the deliberate organization and integration of health care services across different providers and settings to facilitate the delivery of holistic and continuous care to individuals and populations. As individuals move between health care settings or their care needs change, smooth transitions and effective coordination are essential for optimal health outcomes and client well-being.

This chapter aims to provide a comprehensive understanding of transitions of care and care coordination in

community health nursing. By exploring the principles and best practices in transitions of care and care coordination, this chapter seeks to empower community health nurses in their roles as advocates, coordinators, and educators in the health care system. By mastering the art of transitions and coordination, community health nurses can positively impact the health outcomes and well-being of individuals, families, and communities they serve.

30.1 The Effects of Care Coordination and Care Transitions on Outcomes

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 30.1.1 Describe the terms transitional care and care coordination.
- 30.1.2 Identify factors that contribute to poor transitions of care outcomes.
- 30.1.3 Explain how transitional care improves health outcomes.

Transitional care refers to a comprehensive and coordinated set of actions designed to ensure the safe and smooth transfer of clients. It encompasses a range of services and interventions aimed at supporting individuals as they move from one health care provider or facility to another or from one stage of care to another, such as from hospital to home or from acute care to rehabilitation.

The primary goal of transitional care is to optimize continuity and quality of care during these transitions, ensuring that clients experience seamless and coordinated health care. Effective care transitions and care coordination are essential components of a well-functioning health care system. They contribute to improved client outcomes, enhanced client experiences, and reduced health care costs. By ensuring seamless information exchange, collaborative decision-making, and comprehensive care planning, care transitions, and care coordination can minimize care gaps prevent adverse events, and promote optimal health outcomes for individuals in the community.

Community health nurses play a crucial role in facilitating transitional care for clients by managing the transfer of information, responsibilities, and support services between health care providers, settings, and clients themselves. They serve as key coordinators of care, provide education and support to clients and families, and facilitate smooth and effective transitions between health care settings (Institute of Medicine, 2010). To achieve this, community health nurses rely on a set of essential skills and competencies, including care coordination, client education, interdisciplinary collaboration, and communication, among others (Iwamoto, 2023). Additionally, community health nurses are well-positioned to engage in follow-up care activities, such as medication management, home visits, and referrals to community-based resources. These interventions are critical components of transitional care that enhance client safety, prevent readmissions, and increase client satisfaction.

Transitional care interventions often include the following key components:

1. **Assessment and planning:** A thorough evaluation of clients' needs, preferences, and resources is conducted to develop an individualized care plan that addresses their unique requirements during the transition.
2. **Communication and information sharing:** Effective communication among health care providers, clients, and their families is vital. Timely and accurate transfer of medical information, care instructions, and follow-up plans helps ensure continuity of care and prevent errors.
3. **Medication management:** Reviewing and reconciling medication lists, addressing any changes in medications, providing clear instructions, and promoting adherence are crucial in preventing medication errors and adverse events during transitions.
4. **Care coordination:** Collaboration and coordination among health care providers, including nurses, primary care physicians, specialists, and other team members, help ensure a seamless transition and continuity of care.
5. **Client and family education:** Empowering clients and their families with the knowledge and skills needed to manage their health conditions, recognize warning signs, and navigate the health care system effectively promotes self-care and reduces the risk of complications or readmissions.
6. **Follow-up and monitoring:** Establishing appropriate follow-up appointments, monitoring client progress, and ensuring access to support services or resources contribute to ongoing care and prevent gaps in care.

Transitional care interventions minimize adverse events, promote client safety, enhance client satisfaction, and improve health outcomes during care transitions. Transitional care recognizes the importance of maintaining continuity and coordination throughout the health care journey to facilitate a seamless and client-centered health care experience. [Table 30.1](#) compares transitional care interventions.

	Transitional Care	Care Transition	Care Coordination
Definition	The process of transferring clients' care between health care providers or settings, ensuring the continuity of care, and promoting client safety	The movement of clients between health care settings or levels of care (e.g., hospital to home, hospital to long-term care facility)	The process of organizing and coordinating health care for clients, involving collaboration between health care providers, clients, and their families
Focus	Coordinating the handoff of care during transitions to optimize client outcomes and avoid medical errors	Ensuring a smooth and safe transfer of care as clients move between different health care settings	Coordinating the delivery of health care services to ensure continuity and effective care for clients

TABLE 30.1 A Comparison of Transitional Care Interventions

Care Transitions

Care transitions are critical junctures in health care where individuals move from one health care setting to another or experience changes in their care needs. In the community setting, transitions of care encompass a wide range of scenarios.

Some common types of transitions include:

- Hospital to Home: This transition often requires careful planning to ensure that clients receive the necessary support and resources to manage their health conditions at home ([Figure 30.2](#)).
- Home to Long-Term Care: Transitions from home to long-term care settings, such as nursing homes or assisted living facilities, may occur when individuals require a higher level of assistance or specialized care that cannot be adequately provided in their homes. These transitions involve coordination between home care services, long-term care facilities, and families to ensure a smooth transfer of care.
- Rehabilitation or Subacute Care: Transitions to rehabilitation or subacute care facilities are common when individuals require intensive therapy, post-surgical care, or recovery support following an acute illness or injury. These transitions involve coordinating the transfer of medical information and care plans between acute care hospitals and rehabilitation facilities.

FIGURE 30.2 Nurses are involved in the transition of care when clients are discharged from hospitals to their homes. This photo depicts the discharge of a veteran who spent 50 days in a VA hospital recovering from COVID-19. (credit: “Arvin McCray, first COVID-19 patient goes home aft 50 days” by Milwaukee VA Medical Center/Flickr, Public Domain)

The quality of the care transition can have an impact on clients, families, and health care providers.

- **Client Outcomes:** Effective transitions of care positively influence client outcomes, leading to improved health outcomes, reduced hospital readmissions, and enhanced quality of life. Well-coordinated transitions support medication adherence, timely access to follow-up care, and effective self-management.
- **Family Involvement and Support:** Transitions of care affect not only clients but also their families, who play a crucial role in supporting the transition process. Inadequate support or coordination can result in caregiver burden, stress, and challenges in managing the care needs of their loved ones.
- **Nurses and Other Health Care Providers:** Transitions of care impact all health care providers by requiring effective communication, collaboration, and coordination. Nurses must ensure accurate transfer of information, address client and family concerns, and support clients during the transition process.

Care Coordination

Nurses are central to care coordination efforts, utilizing their unique knowledge, skills, and expertise to facilitate the delivery of comprehensive and seamless care as clients move between different health care settings, ensuring the continuity of care. This process involves sharing critical client information, including medical history, diagnoses, medications, and care plans, with the receiving nurses and other health care providers. This information exchange helps prevent care gaps and gives a comprehensive understanding of the client's needs, enabling providers to deliver appropriate and timely interventions.

Care coordination involves identifying clients' specific needs during transitions and making timely and appropriate referrals to other health care professionals or community resources. For example, a community health nurse may coordinate referrals to home health services, physical therapy, or social support services to facilitate a smooth transition and ensure ongoing care and support for the client.

Coordinated care includes **medication reconciliation**, the process of comparing a client's medication orders to all the medications that the client has been taking and ensuring that clients have access to necessary medications during transitions. This helps prevent medication errors. Ensuring that clients have a clear understanding of their medication regimen, dosages, and any changes that may have occurred during the transition reduces the risk of adverse drug events and enhances client safety.

Care coordination promotes collaboration and communication among health care providers involved in the client's care. This collaboration allows for the exchange of information, coordination of treatment plans, and addressing any potential issues or concerns during the transition. By working together, health care providers can ensure a smooth handoff of care and provide consistent and coordinated support to the client. During case conferences or interprofessional team meetings, nurses and other health care providers share information, discuss the client's current status, review progress, and collaborate on the development of a comprehensive care plan. They can discuss any challenges or concerns, share updates on treatment plans and interventions, and make decisions collectively to ensure an integrated and cohesive approach to care.

Actively engaging clients and their families in the transition process leads to more sustained outcomes. This includes providing education, support, and resources to empower them to actively participate in their care. Involving clients and their families in care coordination enhances their understanding of the transition process, improves adherence to care plans, and promotes self-management skills, ultimately leading to better outcomes. Arranging appropriate follow-up appointments and monitoring the client's progress after the transition ensures that clients receive timely and necessary post-transition care and support, such as reviewing treatment effectiveness, addressing any concerns or complications, and making any adjustments to the care plan as needed.

Care coordination enhances communication, collaboration, and support among health care professionals, clients, and their families, resulting in improved outcomes, reduced readmissions, and enhanced client experiences during transitions of care.

Factors Contributing to Poor Transitions of Care Outcomes

Many factors can undermine the quality of transitions of care and hinder the achievement of optimal outcomes.

Some challenges or risks associated with transitions of care include:

- **Care Coordination Complexity:** Coordinating care across different health care settings and multiple providers

can be challenging. Lack of care coordination can lead to disjointed care plans, conflicting instructions, and delays in accessing necessary services, which may negatively impact client outcomes.

- Client and Family Factors: Transitions of care can be overwhelming for clients and their families. The stress of navigating new care settings, understanding care plans, and managing medications can contribute to anxiety, confusion, and nonadherence to treatment plans.
- Transitional Care Vulnerabilities: Vulnerable populations, such as older adults, individuals with low health literacy, individuals who are economically insecure, and those with limited social support, face additional challenges during transitions of care. They may have difficulties accessing resources, paying for resources, understanding care instructions, or advocating for their needs.

Communication Breakdown and Limited Health Literacy

Communication breakdowns contribute to poor transitions of care outcomes in several ways. One significant factor is the incomplete transfer of client information between health care providers and settings. Vital details, including medical history, diagnoses, medication changes, and care plans, may be inaccurately documented or omitted, leading to a fragmented understanding of the client's needs and potential risks during the transition.

Limited health literacy contributes to poor transitions of care outcomes. Health literacy refers to an individual's ability to obtain, understand, and use health information to make informed decisions and navigate the health care system. When health literacy is limited, individuals may struggle to comprehend medical instructions, follow medication regimens, or engage in self-care, leading to suboptimal management of health conditions during transitions of care.

The absence of standardized communication tools and processes is another challenge. Varying documentation formats, inconsistent terminology, and limited guidelines for handoffs hinder effective information exchange, resulting in misunderstandings, misinterpretations, and vital information being lost in translation.

Transitions of care involve multiple health care professionals working together, but communication breakdowns can occur. Competing responsibilities, inadequate communication channels, and ambiguity regarding roles and responsibilities contribute to confusion, decision-making delays, and missed collaboration opportunities.

Effective communication with clients and their families is vital during transitions of care. Inadequate information sharing, limited health literacy, and cultural or language barriers hinder effective communication, impede understanding, and contribute to gaps in care and medication mismanagement.

Technological barriers also pose challenges. The use of electronic health records (EHRs) and other health information systems, if not optimized for effective communication, can impede the seamless transfer of information. Incomplete or inaccurate data entry, interoperability limitations, and suboptimal user interfaces can hinder the exchange of information between health care settings and providers.

Addressing these communication breakdown factors is crucial. Standardizing communication tools, improving documentation practices, enhancing interprofessional collaboration, involving clients and families, and optimizing health information technology can mitigate communication breakdowns and promote effective communication during transitions of care. By doing so, health care providers can enhance client safety, improve outcomes, and ensure continuity of care throughout the health care journey.

Care Fragmentation

Care fragmentation refers to a lack of communication, collaboration, and integration among various health care entities involved in an individual's treatment and management. This fragmentation can occur at multiple levels, including within health care systems, between different health care settings (such as hospitals, primary care clinics, and specialty clinics), and across different providers involved in a client's care.

The impacts of fragmentation of care on health outcomes are profound and far-reaching. Firstly, fragmented care can lead to delays in diagnosis and treatment, as information and medical records are not easily shared or accessible between different health care providers. This can result in missed or delayed interventions, which can have serious consequences for clients, particularly those with chronic or complex conditions.

Secondly, the lack of coordination and continuity in care can lead to duplicated or conflicting interventions, unnecessary tests, and medication errors. Without a centralized system to track and manage a client's health care

journey, providers may not have a comprehensive understanding of the client's medical history, resulting in suboptimal decision-making and potential harm to the client.

Moreover, fragmentation of care can negatively impact client engagement and empowerment. When clients are shuttled between different providers and settings, they may feel disconnected from their care and struggle to navigate the complex health care system. This can lead to frustration, confusion, and a decreased sense of ownership over their health, ultimately hindering their ability to actively participate in their own care.

Furthermore, fragmented care poses challenges for comprehensive management of chronic diseases. Clients with multiple comorbidities often require the involvement of various specialists and health care professionals, but the lack of coordination can result in fragmented treatment plans and inadequate attention to the client's health needs. This can contribute to suboptimal disease management, poorer health outcomes, and increased health care costs.

Social Determinants of Health and Health Disparities

Social determinants of health (SDOH) are the nonmedical factors that significantly influence health outcomes and disparities. They include socioeconomic status, education and health literacy, social support networks, housing and environment, and access to health care. As discussed in [Social Determinants Affecting Health Outcomes](#), disadvantaged socioeconomic status often translates into reduced access to quality health care, limited transportation options, and financial constraints, all of which impede seamless transitions of care. For example, individuals with lower incomes may be unable to afford necessary medications or follow-up appointments, resulting in interrupted continuity of care and increased health risks.

Health disparities, which are systemic differences in health outcomes among different population groups, exacerbate the challenges faced during transitions of care. Disadvantaged communities, including racial and ethnic minorities, individuals with disabilities, and older adults, often experience higher rates of chronic diseases and face barriers to accessing health care services. These disparities can stem from structural and social determinants of health, such as discrimination, inadequate health care infrastructure, and limited availability of culturally responsive care. Consequently, individuals from these populations are more likely to encounter difficulties during transitions of care, leading to poorer health outcomes.

SDOH have a significant impact on transitions of care and creates a complex web of challenges that contribute to poor transitions of care outcomes. Efforts to improve health literacy through educational initiatives and enhanced communication strategies are crucial in empowering individuals to actively participate in their care during transitions. Additionally, addressing SDOH including health disparities requires comprehensive interventions, such as equitable health care policies, improved access to affordable health care, and culturally responsive care delivery. By addressing these interconnected issues, health care systems can strive to minimize the impact of SDOH and improve transitions of care outcomes, leading to better health outcomes for all individuals. [Table 30.2](#) summarizes the factors that contribute to poor transitions of care outcomes.

Factors	Description	Contributing Factors
Communication Breakdown	Inadequate exchange of information between health care providers and settings	<ul style="list-style-type: none"> • Lack of standardized communication protocols and channels • Insufficient transfer of medical records • Incomplete or delayed transmission of client information • Language barriers • Misinterpretation of information
Fragmented Health Care	Disjointed care delivery and coordination among multiple providers	<ul style="list-style-type: none"> • Lack of care coordination mechanisms • Inadequate collaboration between health care providers and settings • Fragmented electronic health records (EHR) systems • Inefficient handoffs and referrals • Poor integration of primary care and specialty care
Medication Errors	Errors in medication reconciliation, prescription, or administration	<ul style="list-style-type: none"> • Inaccurate medication histories • Lack of standardized medication reconciliation practices • Inadequate client education on medication management • Illegible or incomplete prescriptions • Lack of medication reconciliation during care transitions
Limited Client Engagement	Insufficient involvement of clients in their own care	<ul style="list-style-type: none"> • Limited health literacy and understanding of care processes • Lack of client empowerment and shared decision-making • Inadequate client education on self-management and care transitions • Limited access to health care information and resources • Cultural or language barriers affecting client engagement

TABLE 30.2 Factors Contributing to Poor Transitions of Care Outcomes

Factors	Description	Contributing Factors
Inadequate Follow-Up Care	Insufficient support and monitoring following the care transition	<ul style="list-style-type: none"> • Delayed or missed appointments • Lack of clear discharge instructions • Inadequate care coordination between settings and providers • Limited access to necessary follow-up services or specialists • Lack of timely communication regarding test results and treatment plans
Socioeconomic Factors	The interaction of social and economic factors that influence care transitions	<ul style="list-style-type: none"> • Limited access to health care services due to financial barriers • Unstable housing or homelessness • Lack of social support and resources • Low health literacy and limited knowledge of available resources • Transportation barriers

TABLE 30.2 Factors Contributing to Poor Transitions of Care Outcomes

To address communication breakdowns during transitions of care, several strategies can be implemented:

- Standardizing Communication: Health care organizations should adopt standardized communication tools, such as structured handoff protocols like SBAR (Situation, Background, Assessment, Recommendation) to ensure a consistent and comprehensive transfer of information, enabling effective communication during transitions.
- Improved Documentation Practices: Encouraging accurate and detailed documentation of client information, medication lists, and care plans supports effective information exchange. The use of electronic health records with standardized templates can facilitate consistent and comprehensive documentation practices, minimizing the risk of vital information being overlooked or misinterpreted.
- Enhancing Interprofessional Collaboration: Establishing clear communication channels, holding regular team meetings, and implementing shared decision-making frameworks help prevent communication breakdowns and enhance collaboration. By fostering a culture of effective communication, health care providers can ensure a smooth and coordinated transition process.
- Client and Family Involvement: It is vital to actively engage clients and their families in the transition process via client education, shared decision-making, and clear communication. Using plain language, providing written materials, and considering cultural and linguistic factors contribute to client engagement and mitigate communication barriers. By involving clients and families as partners in care, health care providers can improve understanding, promote adherence, and promote successful care transitions.
- Technology Optimization: Health care organizations should prioritize the optimization of health information technology. This includes ensuring interoperability between different systems, implementing user-friendly interfaces, and enabling comprehensive data-sharing capabilities. By optimizing technology, health care providers can facilitate seamless communication, reduce errors, and improve the exchange of information during transitions of care.

Transitional Care Improves Health Outcomes

Transitional care, when effectively applied, can significantly improve health outcomes for clients. This integrated and coordinated approach ensures that clients receive the care they need, when they need it, and in a way that they understand. It is a comprehensive, person-centered, and evidence-based approach that facilitates the safe and timely movement of clients between levels and locations of health care. Effective transitional care is characterized by continuity of care, regular follow-ups, personalized care plans, client and caregiver education, medication reconciliation, and careful scheduling of appointments. It promotes improved communication between health care providers across different settings, reduces hospital readmissions, and decreases health care costs.

For the client, effective transitional care feels supportive, well-coordinated, and tailored to their unique needs. They experience a seamless transition between care settings with no unnecessary repetition of medical histories, tests, or procedures. Clients receive education about their conditions and medications, and they are encouraged to be active participants in their care, which enhances their sense of control and responsibility for their health outcomes.

CASE REFLECTION

Transistional Care

The following scenario provides more information on Mrs. Johnson from the chapter-opening scenario. Read the scenario, and then respond to the questions that follow.

Seventy-two-year-old Mrs. Johnson was hospitalized for congestive heart failure. When discharged, she was still in a fragile state, prone to potential health complications. However, through effective transitional care, Mrs. Johnson's transition from hospital to home was planned and coordinated by a dedicated team, ensuring she was not left to navigate her recovery alone. Mrs. Johnson's transitional care started with a clear and comprehensive discharge plan detailing her medications, diet, and activity levels, ensuring she understood her condition and treatment. The team explained the plan to both Mrs. Johnson and her family, giving them all a chance to ask questions and clarify the plan of care. A registered nurse followed up with Mrs. Johnson within 48 hours of discharge, answering questions and addressing any immediate concerns. The care plan included scheduled check-ups with her cardiologist and primary care physician, a visiting nurse service, and connection to a heart failure support group.

Mrs. Johnson's medication was reviewed and reconciled, reducing the risk of medication errors. She was also provided with a 24/7 contact number in case of emergency or if she had any questions about her care. Mrs. Johnson and her family felt supported and empowered, leading to her adherence to her care plan and ultimately resulting in a quicker recovery and significantly lower risk of readmission. Effective transitional care, such as the care Mrs. Johnson received, leverages the strengths of an interprofessional approach, promoting better health outcomes, improving client experience, and reducing health care costs. As the health care system moves toward a more integrated and person-centered model of health care, optimized transitional care is becoming an integral part of the journey toward better health for all.

1. Why is effective transitional care essential for clients like Mrs. Johnson, who have chronic conditions such as congestive heart failure?
2. What are some of the benefits of using an interprofessional approach to plan and coordinate transitional care? How does this approach improve client outcomes and reduce health care costs?
3. What are some potential barriers that may arise when implementing effective transitional care plans?
4. How can nurses address these barriers to ensure clients receive the best possible care?

HEALTHY PEOPLE 2030

Health Communication

Healthy People 2030 focuses on [improving health communication](https://openstax.org/r/healthgovhp) (<https://openstax.org/r/healthgovhp>) so that people can easily understand and act on health information. Health information and messages are often overly complex, making them hard to understand and use. Health care providers who communicate clearly and use

methods like **teach-back** and shared decision-making can help people make informed health-related decisions. Teach-back involves asking the client or family to explain in their own words what they need to know or do about the client's health. These strategies can help improve outcomes, especially for certain groups—like people who have limited health literacy skills or speak English as a second language.

30.2 Care Transition Models

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 30.2.1 Describe care transition models.
- 30.2.2 Compare and contrast care transition models.
- 30.2.3 Describe elements of the IDEAL Discharge Planning guide for engaging the client and family in discharge planning

Care transition models are designed to facilitate the smooth movement of clients from one health care setting to another, ensuring continuity of care and improving overall client outcomes. Care transition models are systematic approaches designed to ensure seamless and safe transition of clients between different levels and settings of care. Various models have been developed to enhance transitional care, addressing specific elements like communication, client and caregiver education, medication reconciliation, and timely follow-ups.

Over time, these models have evolved in response to a need for a more client-centered approach and an aim to reduce health care costs by minimizing hospital readmissions (Earl et al., 2020). Initially, the focus of health care was primarily on acute conditions and emergencies, and client care was often uncoordinated and fragmented. In the 20th century, with advancements in medical sciences and technology, there was a rise in chronic conditions, and health care became more complex. Consequently, there was a growing recognition of the need for a more coordinated approach to client care, particularly for those moving between various care settings. In the late 20th and early 21st centuries, health care started to transition from a primarily fee-for-service model to a more client-centered approach (Coleman & Boult, 2003). This change was catalyzed by the understanding that clients often faced problems related to miscommunication, discontinuity of care, and poor follow-up after hospital discharge, which led to unnecessary readmissions.

There are several transitional care models that have been developed to improve care transitions from hospital to home. The most-used models are the Care Transitions Intervention (CTI), the Transitional Care Model (TCM), and the Better Outcomes for Older Adults through Safe Transitions (BOOST). Each model has varying components but with the same purpose in mind: bridging the care between health care settings so that clients can receive appropriate and coordinated care during the transition process.

Care Transitions Intervention

One of the earliest models to address these issues was the Care Transitions Intervention (CTI), developed by Dr. Eric Coleman (Coleman & Boult, 2003), a primary care provider. Often, Dr. Coleman did not know that his clients had been in the hospital. He also discovered his clients were receiving differing instructions from care team members or did not know whom to call with questions, and their confidence decreased with medication shifts. Often, post-hospitalization, clients became their own care coordinators—which can be overwhelming.

The CTI model empowers clients to take a more active role in their health care decisions, providing them with tools to ensure a smooth transition between care settings. This model marked a shift toward recognizing the importance of client engagement and education in health care. It involves a transition coach who encourages and supports the client to take on a central role in managing their health and health care. This model focuses on four pillars: medication self-management, dynamic client-centered record, primary care and specialty care follow-up, and knowledge of red flags that indicate worsening conditions. The intervention lasts about one month, and the coach predominantly interacts with the client by phone after initial hospital discharge.

Client Example: Mr. Smith, a 65-year-old client with COPD, is frequently hospitalized due to exacerbations. Upon his latest hospital discharge, a transition coach from the CTI program assists Mr. Smith. They work together to ensure that Mr. Smith understands his medication regimen, knows when and why he should see his health care providers, and recognizes signs that his condition is worsening. The coach, mainly via phone contact, empowers Mr. Smith to

manage his disease effectively, aiming to reduce hospital readmissions.

Transitional Care Model

Further evolution of care models came with Mary Naylor's Transitional Care Model (TCM) (Naylor et al., 2004), which centered on high-risk older adults transitioning from hospital to home. This model emphasized the use of advanced practice nurses (APRNs) to coordinate care, educate clients and caregivers, and facilitate communication among various health care providers. It is designed to ensure the health and safety of high-risk older clients. APRNs begin working with the client while they are still in the hospital and continue providing support and follow-up for a period after discharge, up to 2–3 months. TCM emphasizes client and caregiver education, promoting self-management and improving communication among health care providers.

Client Example: Mrs. Zhao, a 78-year-old client with congestive heart failure, was recently discharged from the hospital after a severe exacerbation. She has multiple comorbidities including diabetes and chronic kidney disease. She lives alone and sometimes struggles with medication management and understanding her complex medical instructions. An APRN from the TCM program visits Mrs. Zhao at home, assesses her health and home situation, and provides comprehensive care, including medication reconciliation, education on disease self-management, and arranging necessary appointments with specialists (Mai Ba et al., 2020). The APRN maintains frequent contact over the next couple of months, ensuring Mrs. Zhao's health remains stable.

Better Outcomes for Older Adults Through Safe Transitions

Better Outcomes for Older adults through Safe Transitions (BOOST) targets older adult clients who are at risk for adverse events after hospital discharge. This model prioritizes the identification of risk factors for readmission and addresses them through an individualized discharge plan. BOOST utilizes an interprofessional team that emphasizes accurate medication reconciliation, comprehensive discharge planning, and adequate client education for self-care. BOOST differs from other models in that it is embedded in the hospital and does not extend to home-based care.

Client Example: Mrs. Garcia, an 80-year-old client, was hospitalized for pneumonia. She has a history of dementia and **polypharmacy**, or taking many medications to treat her ailments and additional medications to treat medication side effects. Prior to discharge, an interprofessional team from the BOOST program identifies her risk factors for readmission, such as dementia, multiple medications, and potential for caregiver misunderstanding. They design an individualized discharge plan, ensuring accurate medication reconciliation and providing education to Mrs. Garcia and her family about her condition, medications, and necessary follow-up care.

Comparing Care Transition Models

The Hospital Readmissions Reduction Program (HRRP) of the Affordable Care Act, enacted in 2010, had a significant influence on care transition models (McIlvennan et al., 2015; Wadhera et al., 2019). In response to this legislation, hospitals became more motivated to prevent readmissions, leading to the development of a variety of transition care models. More recently, models like Guided Care and the Patient-Centered Medical Home (PCMH) have emerged, which focus on integrating care among all the client's health care providers, enhancing communication, and implementing comprehensive care plans.

The evolution of care transition models reflects a shift toward a more client-centered, integrated, and coordinated approach to health care. They are driven by a commitment to reduce health care costs, improve client outcomes, and enhance client experience. By focusing on the transition from one care setting to another, these models recognize the importance of communication, continuity, and coordination in providing high-quality health care.

[Table 30.3](#) presents the strengths and limitations of different transitional care models.

Model	Description	Strengths	Limitations
TCM (Transitional Care Model)	This nurse-led model focuses on high-risk older adults transitioning from hospital to home. It includes comprehensive discharge planning and home follow-up.	Proven to reduce the likelihood of readmissions, lower health care costs, and improve client health outcomes	Primarily focuses on older adults and may not be applicable or scalable to all client populations
CTI (Care Transitions Intervention)	This 4-week program aims to improve skills and confidence in self-care among clients. It includes a home visit and three phone calls from a transition coach.	Empowers clients to take active roles in their care and has been shown to reduce hospital readmissions	The short duration (4 weeks) may limit the long-term impact of the intervention.
BOOST (Better Outcomes for Older Adults Through Safe Transitions)	This model reduces preventable readmissions, improves provider workflow, reduces medication-related errors, and prepares and empowers clients, families, and caregivers.	Initiative using medication reconciliation, teach-back, and the Discharge Patient Education Tool (DPET) to reduce medication-related errors	Implementing this process requires a large interprofessional team and a project team—this might not be available in all settings.
Project Re-engineered Discharge (RED) (Jack et al., 2009)	The RED intervention is founded on 12 discrete, mutually reinforcing components and has been proven to reduce rehospitalizations and yield high client satisfaction.	The RED program successfully reduced hospital utilization, improved client self-perceived preparation for discharge, and increased PCP follow-up.	The RED process involves many steps and is primarily provider driven.

TABLE 30.3 Strengths and Limitations of Transitional Care Models

Model	Description	Strengths	Limitations
Chronic Care Model (CCM) (Yeoh et al., 2018)	The CCM identifies the essential elements of a health care system that encourage high-quality chronic disease care: the community, the health system, self-management support, delivery system design, decision support, and clinical information systems.	This model can be applied to a variety of chronic illnesses, health care settings, and target populations. The bottom line is healthier clients, more satisfied providers, and cost savings.	Provider-driven and needs additional support resources in the practice; difficult to motivate clients with short consultation times
Interact Model (Ouslander et al., 2014)	The Interact Quality Improvement Program aims to reduce hospital readmissions and improve care for long-term care residents and provides tools and resources to support care transitions from hospitals to skilled nursing facilities.	Provides tools and resources for effective care transitions from hospitals to skilled nursing facilities; builds collaborative relationships between hospitals and skilled nursing facilities	Many nursing home organizations do not have the infrastructure, skills, expertise, or personnel to develop and implement a comprehensive, facility-wide quality improvement project. Some may only implement parts of the program, which may not improve the transitions of care and prevent hospital readmissions.

TABLE 30.3 Strengths and Limitations of Transitional Care Models

IDEAL Discharge Planning Guide

Discharge planning is a transitional care process that aims to ensure a smooth transition for a client from a hospital or other health care setting to their home or another facility (such as a rehabilitation center, nursing home, or hospice). This process is interprofessional, involving physicians, nurses, social workers, and others who work collaboratively with the client and their family or caregivers. In essence, the goal of discharge planning is to create a comprehensive plan, tailored to the client's individual health needs, personal circumstances, and post-discharge environment, to ensure a successful transition from the hospital to the next phase of care (see [Table 30.4](#)).

Goals of Discharge Planning

To ensure continuity of care	Discharge planning aims to maintain the continuity of care by ensuring that the care the client receives after leaving the hospital is appropriate and effectively coordinated.
To reduce hospital length of stay and unplanned hospital readmissions	Effective discharge planning can help optimize discharge timing and reduce unnecessary delays in the discharge process, potentially reducing the length of the hospital stay. It also aims to reduce the likelihood of hospital readmission by ensuring clients have the necessary care and support after discharge.
To enhance client safety and satisfaction	The discharge process should ensure that clients understand their medication regimen, follow-up appointments, lifestyle recommendations, and signs or symptoms that should prompt a call to a health care provider, reducing the risk of post-discharge complications and improving client satisfaction.

TABLE 30.4 Goals of Discharge Planning

Goals of Discharge Planning

To promote client autonomy and self-care	By involving clients in the discharge planning process, they can better understand their health condition and become more capable of managing their health, thus promoting autonomy and self-care.
To ensure efficient use of hospital and community resources	By facilitating a timely and effective transition of care, discharge planning can also help to optimize the use of resources in both the hospital and the community.

TABLE 30.4 Goals of Discharge Planning

The IDEAL Discharge Planning guide, launched around 2013, is part of the Agency for Healthcare Research and Quality's (AHRQ) Strategy 4: Care Transitions from Hospital to Home (AHRQ, 2017). The IDEAL acronym, standing for Include, Discuss, Educate, Assess, and Listen, reflects the main actions that should be performed by the health care team to effectively involve clients and their caregivers in discharge planning.

The goal of developing this guide was to address the need for better communication and information sharing between clients, families, and health care providers to prevent avoidable readmissions and to enhance clients' capacity for self-care at home after discharge (Figure 30.3). It aimed to involve clients and families more deeply in the discharge process, recognizing that they are essential for successful transitions from hospital to home. The guide was developed based on evidence from research and input from clients and families, health professionals, and health literacy and communication experts.

FIGURE 30.3 Registered nurse case managers coordinate referrals for clients as part of discharge planning. (credit: "Naval Hospital Jacksonville Case Manager 220921-N-QA097-030" by Deidre Smith/U.S. Navy/Flickr, Public Domain)

This approach provides a systematic way to ensure client and family involvement in the discharge planning process. Its elements are as follows:

- **Include:** Include the client and family as full partners in the discharge planning process. This might involve inviting them to team meetings about discharge, consulting them about their preferences and needs, and including them in key decisions about post-discharge care.
- **Discuss:** Talk about the client's condition, treatment, and post-discharge needs in plain language, confirming understanding. Discussing the client's health and care helps the family know what to expect after discharge. This could include discussing the diagnosis, treatment plan, medication regime, follow-up appointments, and any signs or symptoms to watch for.

- **Educate:** Educate the client and family in plain language about the client's condition, the discharge process, and next steps at every opportunity throughout care. Use the teach-back method to ensure the client and their family understand the information.
- **Assess:** Assess how well doctors and nurses explain the diagnosis, condition, and next steps in the care process to the client and family, and use teach-back techniques throughout. Encourage the client and family to ask questions. This step ensures that the client and family understand the information they're given, increasing the likelihood they'll be able to manage care effectively after discharge.
- **Listen:** Listen to and honor the client and family's goals, preferences, observations, and concerns. Listening means giving the client and their family the opportunity to express their concerns, ask questions, and share their preferences. This can help to ensure the discharge plan is personalized to the client's situation.

By incorporating the IDEAL approach into the discharge planning process, health care providers can better ensure that clients and families are active and engaged participants in their care. This can lead to improved health outcomes, a smoother transition from hospital to home, and lower rates of hospital readmissions.

30.3 Role of the Community Health Nurse

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 30.3.1 Describe key responsibilities and competencies of community health nurses in care coordination.
- 30.3.2 Incorporate evidence-based intervention to improve outcomes and safety during the transition of care between care areas.
- 30.3.3 Discuss strategies to improve safety and continuity of care for vulnerable clients.
- 30.3.4 Describe how the nurse can contribute to enhanced quality through care coordination and transition management.
- 30.3.5 Explain the role electronic health, mobile health, and telehealth systems play in the coordination and transition of care.
- 30.3.6 Describe a collaborative approach in coordinating care with other health care professionals and community partners.

The role of the community health nurse (CHN) in transitional care is integral to supporting clients through the often-complex process of moving between care settings, ensuring continuity of care, and promoting optimal health outcomes (see [Table 30.5](#)). While nurses do not often complete all the roles in this process, they are often the central person with the most client contact. This allows them to be sure all the areas are covered for the client.

Role	Description	Client Example
Discharge Planning	CHNs assist in developing comprehensive discharge plans, ensuring clients have the resources and support they need when transitioning from a hospital to home or another health care facility. They coordinate with physicians, social workers, and family members to ensure that the client's needs will be met after discharge.	Mr. Aguilar has been discharged from the hospital following a stroke. The CHN coordinates with the hospital team, Mr. Aguilar, and his family to create a comprehensive discharge plan that includes physical therapy appointments, home care assistance, and regular medical checkups.
Client Education	CHNs educate clients and their families about the client's condition, medications, necessary lifestyle changes, and self-care techniques. They also help them understand the care plan and what to expect during the transition.	The CHN educates Mr. Aguilar and his family about stroke recovery, including lifestyle modifications such as diet, exercise, and stress management, and taking prescribed medications.
Medication Reconciliation	CHNs play a vital role in reviewing and reconciling medications when clients move between care settings, ensuring they understand their medication regimen, and reducing the risk of medication errors or adverse events.	The CHN reviews all of Mr. Aguilar's prescribed medications, checking for potential drug interactions and ensuring Mr. Aguilar and his family understand the dosages and timing for each.

TABLE 30.5 Community Health Nurse Roles in Transitional Care

Role	Description	Client Example
Coordination of Care	CHNs help facilitate communication among the care team, the client, and their family, which is crucial for a smooth transition.	The CHN coordinates Mr. Aguilar's care, communicating with his primary care doctor, physical therapist, and home care aide to ensure a holistic approach and seamless transition to home.
Follow-Up Care	CHNs often conduct follow-up visits or calls to monitor the client's health status, ensure they're adhering to their care plan, and address any health concerns or changes in condition. These follow-ups can help prevent unnecessary hospital readmissions.	The CHN visits Mr. Aguilar at his home a week after his discharge to assess his recovery progress, ensure his adherence to the care plan, and address any new health concerns.
Home Safety Evaluations	CHNs can perform home safety evaluations, identifying potential hazards and recommending modifications to support the client's health, safety, and independence.	Upon Mr. Aguilar's return home, the CHN assesses his living environment for potential hazards like loose rugs or poor lighting that could increase his risk of falls and suggests necessary modifications.
Linkage to Community Resources	CHNs connect clients with community resources that can support their health and well-being, such as meal delivery services, transportation assistance, support groups, and rehabilitation services (Figure 30.4).	The CHN connects Mr. Aguilar with a local meal delivery service, a transportation service for his therapy appointments, and a local support group for stroke survivors.
Advocacy	CHNs advocate for clients' needs and rights during transitions, ensuring they receive the care they need, and their preferences are respected.	The CHN advocates for Mr. Aguilar's needs and preferences, such as his wish to have a family member present at medical appointments, ensuring these are communicated to and respected by the rest of his care team.
Documentation	CHNs ensure all aspects of the transition care process are documented to keep all involved parties informed and facilitate communication among health care professionals.	The CHN documents all aspects of Mr. Aguilar's transition care process, including his medical history, care plan, medication regimen, changes in health status, and interactions with other care providers, ensuring all information is up-to-date and accessible to the entire care team.

TABLE 30.5 Community Health Nurse Roles in Transitional Care

FIGURE 30.4 Community health nurses help connect clients with community resources, such as services that make it easier to access nutritious food. In this photo, a store clerk prepares to load healthy groceries into a client's car during a curbside pickup. (credit: U.S. Department of Agriculture/Flickr, Public Domain)

CASE REFLECTION

The Role of the Community Health Nurse in Transitional Care

The following scenario continues following Mrs. Johnson. Read the scenario, and then respond to the questions that follow.

Before discharge, Mrs. Johnson received education on her condition and her care plan. She also received a follow-up call from a registered nurse two days after her discharge, during which she reported feeling well and having no health or other concerns.

One week later, Mrs. Johnson's community health nurse visited her home for a follow-up visit. The nurse found that Mrs. Johnson had been experiencing shortness of breath and fatigue, which she had not reported during her follow-up call. Upon further assessment, the nurse found that Mrs. Johnson's blood pressure was elevated, and there were changes in her lung sounds. The nurse discovered that Mrs. Johnson had not been following her prescribed diet and medication regimen. The nurse notified Mrs. Johnson's physician, who readjusted the medication regimen and referred Mrs. Johnson to a registered dietitian. With appropriate care and follow-up, Mrs. Johnson's condition improved, and she was able to maintain her health and avoid readmission.

1. How might a lack of communication, such as Mrs. Johnson's failure to report her symptoms, affect the effectiveness of the transitional care plan?
2. What are some of the challenges that the community health nurse may face when conducting a home visit for clients like Mrs. Johnson? How can these challenges be addressed to ensure optimal client outcomes?
3. What strategies could be implemented to encourage client adherence to their prescribed medication and diet regimen? How can the community health nurse support clients in adjusting to their new care routines?

Community Health Nurses' Role in Care Coordination

CHNs play a vital role in care coordination. They provide health care services to individuals, families, and groups within the community, often focusing on prevention, promotion, and maintenance of health. [Table 30.6](#) summarizes their key responsibilities and competencies in care coordination. These responsibilities require a range of competencies, including strong communication skills, leadership abilities, critical thinking, problem-solving,

adaptability, and a solid understanding of public health principles and nursing best practices.

Client Assessment	CHNs assess the health needs of individuals, families, or communities. They identify potential health risks and work toward mitigating these risks through education and direct care.
Health Education and Promotion	CHNs educate clients and community members on healthy behaviors and self-care skills, with the goal of promoting a healthy lifestyle and preventing disease. They also provide information about local resources and health services.
Care Planning and Case Management	CHNs develop and implement care plans based on assessments. They manage cases, coordinating services across different health care providers and community resources, to ensure clients receive comprehensive care that addresses their unique health needs.
Advocacy	CHNs advocate for individual and community health needs, helping clients navigate the health care system, understand their rights, and access necessary resources and services.
Collaboration	CHNs work collaboratively with other health care providers, social workers, educators, and community organizations to improve the overall health of the community. This includes attending multidisciplinary team meetings and contributing to community health strategies.
Monitoring and Evaluation	CHNs monitor the health status of clients and communities, evaluate the effectiveness of interventions, and adjust care plans as needed. They also identify trends and potential gaps in care and work to address them.
Cultural Competency	CHNs must understand and respect the diverse cultural backgrounds, beliefs, and values of their clients. They incorporate cultural considerations into care planning and delivery, fostering a more individualized and effective approach to care.
Research and Evidence-Based Practice	CHNs apply evidence-based practices and use research to inform their care strategies. They may also participate in community health research to further knowledge and improve care services.
Ethical Practice	CHNs must adhere to professional nursing ethics and maintain client privacy and confidentiality at all times.

TABLE 30.6 Role of the CHN in Care Coordination

Evidence-Based Interventions

Transition of care between different care areas is a critical time for clients, and evidence-based nursing interventions can help improve outcomes and enhance client safety during this process. Here are some interventions supported by evidence:

- Effective provider communication (universal transfer tool)
- Health information technology (continue work on interoperability and compatibility)
- Medication reconciliation
- Ensuring access to care after discharge
- Communication of health care information
- Follow-up telephone calls
- Post-discharge home visits

Effective Provider Communication

Effective communication between health care providers plays a vital role in ensuring a seamless transition for clients between different health care settings. Unfortunately, challenges arise due to incomplete health information and the absence of a universally accessible electronic health record (EHR). These limitations impede the ability of acute care providers to access records from ambulatory care and community pharmacy settings, especially when the inpatient provider differs from the primary care provider. Consequently, miscommunication can persist following discharge from the acute care setting, as the primary care provider may not receive comprehensive documentation of the client's diagnostic tests, procedures, and medication changes during hospitalization.

It is crucial to acknowledge that hospital discharge summaries have been identified as primary sources of communication errors, underscoring the need for improvements in this area (Mansukhani et al., 2015). Without adequate information during transfers, it is difficult to maintain continuity of care. The National Transitions of Care Coalition (NTOCC) has recognized the barriers to direct communication between health care providers during client transitions and supports the use of a **universal transfer tool** to facilitate the movement of clients.

A universal transfer tool can be instrumental in supporting care coordination by standardizing the exchange of client information during care transitions. This tool or form helps ensure that essential information, such as client medical history, current medications, diagnoses, and care instructions, is accurately and comprehensively communicated between different health care settings and providers (Mansukhani et al., 2015). It can facilitate efficient and effective handoffs, reducing the risk of miscommunication, medical errors, and adverse events.

Moreover, a universal transfer tool enables health care professionals to have a standardized format for documenting and transmitting critical client information, making it more accessible and understandable across different health care personnel and settings. This enhances continuity of care, enables prompt decision-making, and promotes collaborative care planning.

Medication Reconciliation

Making sure medications are reconciled accurately is crucial to the transition process. The Institute for Health Care Improvement explains that medication reconciliation involves creating a precise list of all the medications a client is taking, including the names of the drugs, their strengths, how often they are taken, and how they are administered. This list is then compared to the orders given by the health care provider during admission, transfer, or discharge.

Throughout a client's care, clinicians may stop, pause, or adjust medications that were previously prescribed to manage or optimize treatment. This makes medication reconciliation during discharge necessary to prevent errors and ensure effective communication for post-acute care. This process involves repeating the initial reconciliation done at admission right before the client is discharged or transferred to another health care setting. The medication list is checked again for accuracy and completeness, and it is shared with the next level of care along with any new prescriptions and written instructions.

The accuracy and completeness of the discharge medication list largely depend on how accurately and completely the medication reconciliation was done at the time of admission. If the list of medications taken at home is incomplete or inaccurate, discrepancies will arise after discharge. For example, studies have found that clients' discharge medication lists frequently contain at least one discrepancy (Caleres et al., 2020; Lalonde, 2008; Mueller et al., 2023). Tomlinson et al. (2020) noted that interventions that best support older clients' medication continuity are those that bridge transitions; these also have the greatest impact on reducing hospital readmission. Interventions that included self-management, telephone follow-up, and medication reconciliation activities were most likely to be effective. Medication reconciliation activities are particularly important as having incorrect information can lead to inappropriate transitions of care and is a significant cause of rehospitalizations among older adults ([Figure 30.5](#)).

FIGURE 30.5 Medication reconciliation is an important part of care coordination. (credit: “Naval Branch Health Clinic Jacksonville Pharmacy 211014-N-QA097-300” by Deidre Smith/U.S. Navy/Flickr, Public Domain)

Access to Care after Discharge

Caregivers must ensure that clients have access to necessary medications and durable medical equipment such as nebulizers, walkers, wheelchairs, and home oxygen. It’s also crucial for clients to properly fill, pick up, and take their medications. Weir et al. (2020) found that almost half of all clients did not adhere to some or all changes made to their medications at hospital discharge and that clients who did not adhere to any of their medication changes had a significantly higher risk of adverse events compared to those who did.

Access to a pharmacy is also important for clients to adhere to their medication regimen after discharge. Research has shown that fewer clients obtained their medications when given a prescription compared to when they were given the medications directly during a hospital visit. There are programs that aim to improve medication access and reduce readmission rates. For example, the Medication REACH program provided uninsured clients with free medications for the first 30 days after discharge. A study conducted at Einstein Medical Center in Philadelphia found that clients in the program had a lower readmission rate compared to those in the control group (American Society of Health-System Pharmacists and American Pharmacists Association, 2013).

Some health care facilities have started delivering medications to clients at their bedside before discharge (Katz et al., 2020). This approach, along with follow-up phone calls a few days later, has been found to significantly reduce readmission rates compared to standard care (Katz et al., 2020). Bedside medication delivery can help overcome initial barriers to medication access and address any insurance or medication-related issues before the client leaves the hospital.

Communication of Health Care Information

Sharing health care information with clients and their families can be challenging due to various factors like physical limitations (e.g., hearing, vision, or cognitive impairments) and low health literacy. It’s important to note that only around 12 percent of Americans have a high level of health literacy, and more than one-third struggle with basic health tasks, such as understanding prescription labels (Lopez et al., 2022). Individuals with poor health literacy or cognitive impairments may have difficulty reading and comprehending written health information. This can lead to problems like not following discharge instructions or medication regimens as well as failing to follow up with health care providers after leaving the hospital.

To address these challenges, health care providers and CHNs should allocate sufficient time to interact with clients and identify any barriers they may face, such as low health literacy or cognitive deficits. This allows providers to find effective ways to overcome these barriers and improve communication with these clients.

Follow-Up Telephone Calls and Home Visits

Programs like Medication REACH and BOOST have introduced follow-up telephone calls to improve transitions of care. These calls focus on important aspects like the client's medication list, any side effects experienced, their overall health, and any challenges they face in filling their prescriptions. The timing of these calls varies, ranging from 24 to 72 hours after discharge. The aim is to promptly address client needs, resolve any issues during the transition between care settings, and assess their ability to self-manage their health. However, a systematic review found that follow-up telephone calls alone didn't have a significant impact on readmission rates (Crocker et al., 2012). Van Spall et al. (2019) found that making the follow-up part of a patient-centered intervention that included follow-up calls, nurse-led home visits, and interprofessional clinics were associated with a reduction in readmissions and death in heart failure clients.

Many programs, including the Veterans Affairs (VA) and Accountable Care Organizations (ACO), have also adopted post-discharge home visits by different health care providers (Pedersen et al., 2017). These visits allow providers to monitor vital signs, check laboratory test results, manage medication usage, provide additional health education, and identify new problems. Additionally, telehealth services (or telemedicine) can remotely monitor a client's health status at home and transmit this information to health care providers. This enables adjustments to drug regimens as necessary, potentially preventing rehospitalizations. Srivastava et al. (2019) found that personalized and client-centered home telehealth monitoring in heart failure clients was successful in reducing admissions without an increase in outpatient visits or hospital readmission in VA clients ([Figure 30.6](#)). During the COVID-19 pandemic, studies highlighted a novel and sustained shift to telehealth that they found reduced barriers to accessing high-value services for older adults during transition periods like discharge to home (Anderson et al., 2021).

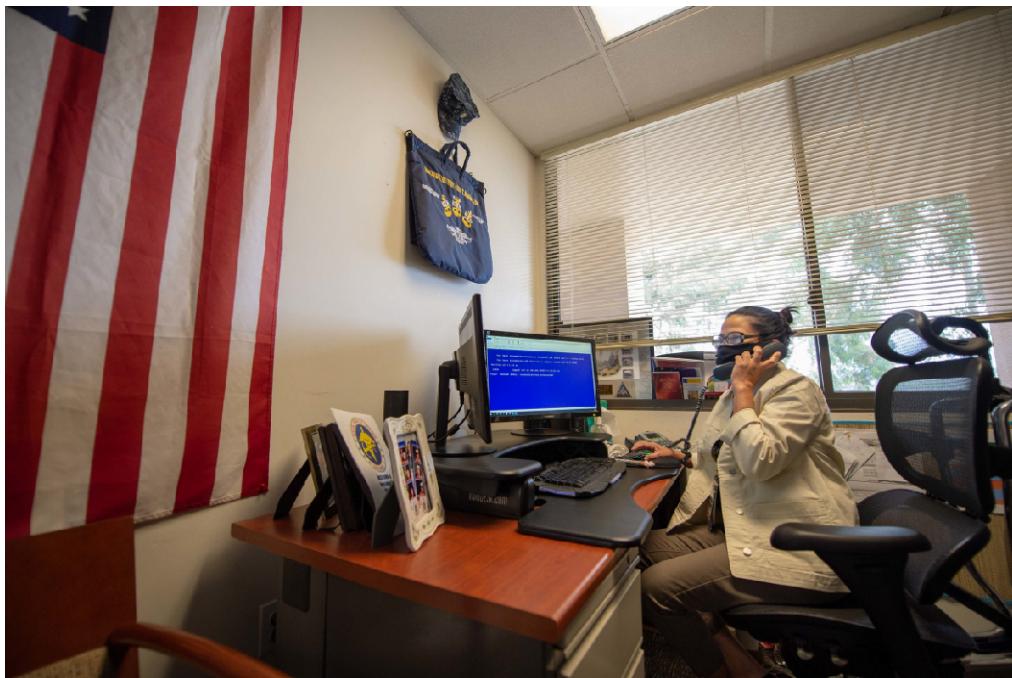

FIGURE 30.6 A nurse with the Naval Medical Center San Diego conducts virtual client visits. (credit: Erwin Jacob V. Miciano/U.S. Navy/Flickr, Public Domain)

Strategies to Improve Safety and Continuity of Care for Vulnerable Clients

Care coordination is a critical aspect of health care for vulnerable clients, particularly those with behavioral health needs and those in need of end-of-life/palliative care. Effective care coordination strategies are essential to ensure that these clients receive timely and appropriate services that meet their unique needs. Strategies such as collaborative care models, care teams, and the use of EHRs can help facilitate effective care coordination, ultimately resulting in improved outcomes for vulnerable clients.

Clients transitioning for end-of-life or palliative care services require specialized care that addresses their physical, emotional, and spiritual needs. Effective care coordination for these clients involves ensuring access to appropriate services, including hospice care, counseling services, and pain management. It also involves identifying and

addressing cultural and spiritual needs to ensure that care is provided in a compassionate and respectful manner (Reeves et al., 2020).

Transitional care for behavioral health discharges poses a challenge due to the vulnerable period that clients experience during the transition from acute mental health inpatient to community care. Clients discharged from behavioral health hospitals may experience additional risks and anxiety during this period as they adjust to new environments and face potential challenges in accessing follow-up care. Additionally, clients with mental health conditions may have complex care needs that require specialized support and resources, which may not be readily available in the community.

Evidence-based discharge planning for behavioral health clients involves using strategies that have been shown to improve client outcomes and reduce readmissions. This includes conducting a comprehensive needs assessment, collaborating with clients and their families to develop a client-centered care plan, coordinating care and services with community providers, and ensuring timely follow-up appointments and communication between inpatient and outpatient providers (National Institute of Mental Health, 2019).

Effective discharge planning also involves providing clients with education and resources to manage their condition, including medication management and crisis support, and involving family members or other caregivers in the transition process (National Alliance for Suicide Prevention, 2019). Research has shown that evidence-based discharge planning can improve client outcomes and reduce readmissions for clients with mental health conditions (Pincus et al., 2016). By providing clients with the support and resources they need to manage their condition, evidence-based discharge planning can help clients successfully transition from inpatient to outpatient care and improve their overall quality of life.

Quality Through Care Coordination and Transition Management

The main goal of transitional care models is to create a care plan that meets the specific needs of each client and provides continuous care across different settings. This involves organizing practical arrangements, educating clients and their families, and coordinating services during transitions.

Nurses are often at the forefront of quality improvement initiatives. They can actively participate in interprofessional teams, contribute to the development of care protocols and standards, and provide valuable feedback based on their firsthand experiences. Nurses are directly responsible for monitoring and assessing clients and performing immediate interventions to reduce risk or prevent medical complications. Nurses also oversee other care providers, such as certified nursing assistants (CNAs), licensed practical nurses (LPNs), patient care technicians, caregivers, and more. A nurse educates clients and family members regarding post-hospital care before discharge. Nurses' keen observations and drive for client safety at each of these intersections can contribute to quality improvement.

Quality improvement initiatives around transitions of care must be interprofessional and can be led by nurses. The areas for improvement can be around the care planning and include the following steps that could be optimized:

- **Assessment:** The transitional care nurse, who specializes in caring for clients with chronic conditions like heart disease, stroke, COPD, cancer, and diabetes, begins by evaluating the client's health status and behaviors, the level of care and support needed, and their health goals.
- **Accumulating Data:** The nurse collects all the necessary information and enters it into the health care provider's electronic medication administration record (eMAR) system. This data is used to develop a personalized care plan for the client.
- **Access:** Authorized health care professionals like doctors, nurses, and social workers can access the care plan to provide evidence-based daily care to ensure the client's optimal health upon discharge.
- **Appointments:** The transitional care nurse continues to provide care even after the client leaves the hospital. This includes home visits or remote appointments for about 12 sessions, ensuring a smooth transition from the hospital to the home environment.
- **Adjustments:** The nurse remains available via telephone for clients and their families to seek additional medical advice when needed. This is crucial for identifying changes in the client's health condition and making necessary adjustments to their care.

The box below provides an example of a quality improvement project.

QUALITY IMPROVEMENT PROJECT EXAMPLE

A standardized discharge process for clients transitioning from the hospital to their homes or other care settings is one example of a quality improvement project that focuses on transitional care. This project aims to improve communication, reduce readmission rates, and ensure seamless transitions for clients.

1. Project Goal: The goal is to develop and implement a standardized discharge process that promotes effective communication, client education, and coordination of care during the transition from hospital to home or other settings.
2. Interprofessional Team: A team of health care professionals, including nurses, physicians, case managers, pharmacists, and quality improvement experts, is formed to lead the project.
3. Gap Analysis: The team conducts a thorough assessment of the current discharge process to identify areas for improvement. This may involve reviewing existing protocols, interviewing staff, and analyzing client feedback.
4. Development of Standardized Protocols: Based on the findings, the team develops standardized protocols and guidelines for the discharge process. This includes clear instructions for medication reconciliation, client education materials, follow-up appointment scheduling, and communication with primary care providers.
5. Staff Education and Training: The team provides comprehensive education and training sessions for health care staff involved in the discharge process. This ensures that all team members understand their roles, responsibilities, and the new protocols.
6. Implementation and Monitoring: The standardized discharge process is implemented and closely monitored for effectiveness. Key metrics to monitor may include readmission rates, client satisfaction scores, and adherence to the protocols.
7. Continuous Improvement: Regular meetings and feedback sessions are conducted to evaluate the project's progress and identify areas for further improvement. The team gathers input from clients, families, and staff to refine the process and address any issues that arise.
8. Data Analysis and Reporting: The team analyzes the data collected throughout the project to assess its impact on readmission rates, client outcomes, and health care utilization. The findings are reported to concerned parties, including hospital leadership and relevant departments.
9. Sustainability and Spread: Once the project has demonstrated positive results, efforts are made to sustain the standardized discharge process and spread it to other departments or health care facilities within the organization. This may involve creating implementation toolkits, sharing best practices, and providing ongoing support and education.

By focusing on improving the transitional care process through standardized discharge protocols, this quality improvement project aims to enhance client safety, reduce readmissions, and promote better coordination and continuity of care during care transitions.

HIT in Care Coordination

Evidence-based approaches using health information technology (HIT) to aid in care coordination have been developed (Marcotte et al., 2015). HIT may provide a more timely and seamless transfer of information between providers and health care settings compared with traditional paper forms. Electronic health records (EHRs) are helpful tools that can enhance providers' access to health information, reduce redundant tests and repetitive medical histories, and improve communication between health care professionals.

Health information technology, including EHRs, mobile health (mHealth), and telehealth systems, plays a vital role in enhancing the coordination and transition of care.

- *EHRs:* EHRs are digital versions of clients' medical records that provide a centralized repository of health information. They enable health care providers across different settings to access and share client data, ensuring seamless coordination and transitions. EHRs allow for quick retrieval of vital information, such as medical history, medication lists, lab results, and allergies, facilitating more efficient and informed decision-making.

- *Care Coordination Platforms:* HIT platforms designed for care coordination allow health care providers to collaborate and exchange information about a client's care plan, progress, and treatment goals. These platforms enable real-time communication among the care team, supporting effective care coordination and reducing the risk of miscommunication or duplicated efforts.
- *mHealth Applications:* Mobile health applications, accessible on smartphones or tablets, offer clients and health care providers various tools to manage and monitor health. These applications can facilitate self-care and client engagement by providing educational resources, medication reminders, symptom tracking, and appointment scheduling. Clients can share data collected through mHealth apps with their health care providers, ensuring continuity and coordination of care (Debon et al., 2019).
- *Telehealth Systems:* Telehealth involves the use of technology to provide remote health care services, including virtual consultations, remote monitoring, and telemedicine. Telehealth systems enhance care coordination and transitions by enabling health care providers to remotely assess and monitor clients, consult with specialists, and offer follow-up care. This reduces the need for unnecessary hospital visits and facilitates ongoing care from the comfort of clients' homes.
- *Interoperability and Data Exchange:* Interoperability refers to the ability of different health care systems and technologies to exchange and interpret data seamlessly. HIT systems that support interoperability allow for the secure sharing of client information between different health care providers and settings. This facilitates care coordination and transitions, as relevant data can be accessed by authorized personnel at the right time, leading to more informed decision-making and continuity of care.
- *Decision Support Systems:* HIT systems often incorporate decision support tools that provide evidence-based guidelines, alerts, and reminders to health care providers. These tools help ensure adherence to best practices and enhance care coordination by supporting consistent and standardized care across different settings. Decision support systems can prompt health care providers with relevant information during care transitions, reducing the likelihood of errors or omissions.

THEORY IN ACTION

Transitions of Care

[Access multimedia content \(<https://openstax.org/books/population-health/pages/30-3-role-of-the-community-health-nurse>\)](https://openstax.org/books/population-health/pages/30-3-role-of-the-community-health-nurse)

As clients transition from one health care provider to another, their information needs to follow them. Health information exchanges (HIE) enable the fast, private, and secure movement of client information between health care organizations. The video "Transitions of Care" highlights how the Massachusetts statewide HIE (Mass Hiway) enables this process.

Watch the video, and then respond to the following questions.

1. How does the implementation of a health information exchange (HIE) impact the continuity of care for clients as they transition between health care providers? Consider the benefits and challenges associated with this system in ensuring that client information follows them seamlessly.
2. In what ways does an HIE contribute to client safety and reduce medical errors during transitions of care? Reflect on the potential risks and benefits of sharing client information electronically across health care organizations.
3. How can the use of an HIE improve the overall efficiency and effectiveness of health care delivery? Explore the potential impact of HIEs on reducing duplicate testing, enhancing care coordination, and facilitating better-informed clinical decision-making.

Collaborative Approaches in Coordinating Care

A collaborative approach in coordinating care with other health care professionals and concerned parties is essential to improve client outcomes and quality of care. Collaboration involves the integration of knowledge, skills, and expertise from multiple health care providers, including physicians, nurses, pharmacists, and other allied health professionals. According to Reeves et al. (2017), collaboration in health care requires a shared understanding of client needs, effective communication, mutual trust, and respect among health care providers.

One example of a collaborative approach in health care coordination is the use of interprofessional teams. Interprofessional teams involve health care providers from different disciplines working together to provide comprehensive care to clients. According to Bachynsky (2019), interprofessional teams can improve client outcomes, reduce health care costs, and enhance the quality of care. Interprofessional teams can include physicians, nurses, pharmacists, social workers, and other health care professionals who work collaboratively to develop and implement care plans for clients ([Figure 30.7](#)).

FIGURE 30.7 Physical therapists are frequently part of the interprofessional team providing comprehensive care to clients. This photo shows two physical therapists consulting about a client. (credit: “Pacific Partnership 2022 Side-by-Side Physical Therapy Exchange Aboard USNS Mercy 220801-N-AU520-1045” by Jacob Woitzel/U.S. Navy/Flickr, Public Domain)

Another example of a collaborative approach in health care coordination is the use of care coordination platforms (see the box below). Care coordination platforms provide a centralized location for health care providers to communicate and collaborate on client care (Duan-Porter et al., 2020). These platforms can improve care coordination and reduce the risk of miscommunication or duplication of services. Clients can also use care coordination platforms to communicate with their health care providers, access educational resources, and manage their health information.

COLLABORATIVE CARE COORDINATION EXAMPLE

John Smith is a 65-year-old client who recently had a heart attack and is being discharged from the hospital. His care requires collaboration among different health care workers for effective care coordination.

1. Hospital Physician: The hospital physician who treated John during his hospital stay communicates John’s medical condition, treatment plan, and medication prescriptions to the care team for a smooth transition.
2. Cardiologist: John’s cardiologist, who specializes in heart conditions, reviews John’s medical history, test results, and treatment plan. They collaborate with the care team to ensure appropriate follow-up care, including medication adjustments, lifestyle modifications, and further cardiac evaluations if necessary.
3. Primary Care Physician (PCP): John’s PCP plays a vital role in his care coordination. The PCP is notified about John’s hospitalization and collaborates with the hospital physician and specialists to receive updates on John’s condition, treatment, and recommendations for ongoing care.
4. Pharmacist: The pharmacist ensures that John understands his prescribed medications, including dosage, frequency, and potential side effects. They collaborate with the care team to resolve any medication-related concerns, such as drug interactions or allergies, and coordinate medication refills.

5. Home Health Nurse: A home health nurse visits John after his discharge to assess his recovery, provide education on post-heart attack care, monitor vital signs, and ensure proper wound care if necessary. The nurse collaborates with the hospital physician and PCP to report any changes in John's condition and adjust the care plan as needed.
6. Physical Therapist: A physical therapist works with John to develop an exercise and rehabilitation program tailored to his condition. They collaborate with the care team to monitor John's progress, make appropriate adjustments to the therapy plan, and ensure continuity of care.
7. Case Manager/Social Worker: The case manager or social worker acts as a coordinator, ensuring effective communication among all health care team members. They assess John's social and support needs, provide resources for community services, and coordinate follow-up appointments and tests.

Chapter Summary

30.1 The Effects of Care Coordination and Care Transitions on Outcomes

Transitional care is a process that supports clients as they move between different health care settings, ensuring continuity and safety. Factors contributing to poor transitions of care outcomes include communication breakdown, care fragmentation, limited health literacy, socioeconomic factors, and health disparities. Transitional care promotes seamless and well-coordinated care, reducing medication errors, preventing readmissions, and enhancing client engagement. By understanding the importance of effective care coordination and transitions, health care professionals can strive to optimize client outcomes and overall health care system performance.

30.2 Care Transition Models

Care transition models are frameworks designed to facilitate smooth transitions of care. Commonly used models include CTI, TCM, and BOOST. Each model aims to ensure that clients can receive appropriate and coordinated care during the transition process. Discharge planning helps ensure a smooth transition for a client from a hospital or other health care setting

Key Terms

care coordination the deliberate organization and integration of health care services across different providers and settings to facilitate the delivery of holistic and continuous care to individuals and populations

care fragmentation the division and disconnection of health care services and providers, leading to disjointed and uncoordinated client care

care transition models strategic frameworks designed to improve the coordination and continuity of health care as clients transfer between different locations or different levels of care

care transitions critical junctures in health care where individuals move from one health care setting to another or experience changes in their care needs

discharge planning a transitional care process that aims to ensure a smooth transition for a client from a hospital or other health care setting to their home or another facility (such as a rehabilitation center, nursing home, or hospice)

medication reconciliation the process of comparing a client's medication orders to all the medications that the client has been taking

polypharmacy taking many medications to treat

to their home or another facility. The IDEAL Discharge Planning guide engages clients and their families, emphasizing the importance of client-centered care, effective communication, and education.

30.3 Role of the Community Health Nurse

CHNs play a crucial role in improving outcomes and safety during care transitions through the incorporation of evidence-based interventions. CHNs may use a variety of strategies to enhance safety and continuity of care for clients transitioning from behavioral health hospitalization to outpatient care, with each emphasizing the importance of a comprehensive and client-centered approach. CHNs contribute to enhanced quality through care coordination and transition management by promoting effective communication, client engagement, and seamless transitions. Utilizing electronic health, mobile health, and telehealth systems facilitates coordination and transitions of care. A collaborative approach in coordinating care with other health care professionals and concerned parties ensures comprehensive and coordinated client care.

ailments and additional medications to treat medication side effects

teach-back teaching technique that involves asking the client or family to explain in their own words what they need to know or do about the client's health to ensure the client and their family understand the information

transition of care the movement of clients from one health care setting to another or from one level of care to another

transitional care a comprehensive and coordinated set of actions designed to ensure the safe and smooth transfer of clients, encompassing a range of services and interventions aimed at supporting individuals as they move from one health care provider or facility to another or from one stage of care to another, such as from hospital to home or from acute care to rehabilitation

universal transfer tool tool or form that helps ensure that essential information, such as client medical history, current medications, diagnoses, and care instructions, is accurately and comprehensively communicated between different health care settings and providers

Review Questions

1. Which transition of care intervention would the community health nurse perform when a client is discharged from the hospital to home?
 - a. Assisting the client with activities of daily living
 - b. Administering medications in the home setting
 - c. Performing medication reconciliation
 - d. Transporting client to medical appointments
2. Which condition does the nurse recognize as increasing the risk of a poor outcome during a transition of care?
 - a. A client being discharged from hospital to home
 - b. A client with an identified social support system
 - c. A client with limited health literacy
 - d. A client with one provider
3. The home care nurse is performing medication reconciliation with a client during the first home visit following hospital discharge. Which statement by the client requires follow-up by the nurse?
 - a. "I understand why the doctor has stopped some of my medications."
 - b. "I have not seen that blue pill before."
 - c. "I set alarms on my phone to remind me to take my medications."
 - d. "I use a daily pill box to set up my medications."
4. The nurse, caring for a client who will be transferred from the hospital to a rehabilitation facility following a stroke, is using a care transition model to facilitate the transfer. Which explanation for the use of a care transition model will the nurse provide to the nursing student working the client?
 - a. "Care transition models predict client outcomes during care transitions."
 - b. "Care transition models guide health care providers in the decision-making process."
 - c. "Care transition models support the coordination of care between health care settings."
 - d. "Care transition models focus on client education during care transitions."
5. Which action will the nurse take when planning discharge for a client using the IDEAL Discharge Planning guide?
 - a. Use accurate medical terms when educating the client and family about discharge instructions
 - b. Engage clients and their families in the discharge planning process
 - c. Ask the client if they have any questions to evaluate understanding of the discharge teaching
 - d. Provide the client with a standardized discharge plan of care
6. Using the Transitional Care Model (TCM), which action would the nurse take when preparing an 81-year-old client with diabetes, hypertension, and heart failure for discharge home from the hospital following an exacerbation of heart failure?
 - a. Provide the client with a standardized plan of care to follow
 - b. Identify risk factors for readmission and develop an individualized discharge plan
 - c. Refer the client to a discharge coach to encourage client self-management
 - d. Contact the advanced practice nurse to coordinate the discharge from hospital to home
7. The community health nurse is facilitating transitional care for an older adult client between the hospital and home. Which action is a priority responsibility of the community health nurse in this transition of care?
 - a. Providing direct client care in the home setting
 - b. Educating clients about health promotion and prevention
 - c. Coordinating care among health care providers
 - d. Administering medication in the home
8. A nurse is concerned about the increasing rate of hospital readmissions in clients due to not filling or picking up prescriptions at the pharmacy after discharge from the hospital. Which intervention should the nurse

recommend to the hospital leadership to improve adherence to the medication regimen after discharge?

- a. Calling prescriptions in to the client's pharmacy at discharge
 - b. Handing client prescriptions for home medications during discharge instruction
 - c. Providing client with home medications at discharge
 - d. Telling the client that medication adherence will reduce readmissions to the hospital
- 9.** Which intervention by the community health nurse improves care for clients during the transition from behavioral health hospitalization to outpatient care?
- a. Ensuring effective communication among health care providers
 - b. Reducing the number of providers involved in the client's care
 - c. Requiring medications to be taken under direct observation by a nurse
 - d. Attending follow-up appointments with the client
- 10.** Which health information system would the nurse utilize to promote self-management in a client with diabetes who has been having difficulty controlling blood glucose levels?
- a. Decision support systems
 - b. Mobile health applications
 - c. Care coordination platforms
 - d. Electronic health records

CHAPTER 31

Caring for Populations and Communities in Crisis

FIGURE 31.1 Recognizing a community in crisis is not always as simple as reading the writing on the wall. Working in the community, nurses are uniquely positioned to recognize the signs of crisis and advocate for their clients' needs. (credit: modification of work "!!!" by Eric Chan/Flickr, CC BY 2.0)

CHAPTER OUTLINE

- 31.1 Trauma-Informed Care
- 31.2 The Mental Health Crisis
- 31.3 The Opioid Epidemic and Substance Use Disorders
- 31.4 Human Trafficking
- 31.5 Refugees

INTRODUCTION One morning in a suburban Texas emergency department (ED), Eileen, a self-identified 16-year-old female, presented for treatment, clutching her abdomen and complaining of pain. Following an assessment, the ED nurse could not find anything wrong with Eileen. When told she could go home, Eileen said if she went home, she'd "kill myself by taking a whole bottle of extra-strength Tylenol." Since Eileen could not be discharged if her life was in danger, she was moved to a bed in the hospital's inpatient mental health unit, where psychiatric nurse Sally Strong was in the middle of her shift. Nurse Strong scrolled through Eileen's chart to see if she had any previous mental-health visits or a history of depression. Finding none, Nurse Strong noticed that Eileen had recently been to several nearby EDs, each time receiving treatment for sexually transmitted infections (STIs) and various types of substance misuse (marijuana, cocaine, ecstasy, and bath salts). A few months earlier, Nurse Strong's hospital implemented a protocol that helped nurses identify victims of sex trafficking. Eileen's repeated ED visits for STIs and substance misuse suggested to Nurse Strong that Eileen might be one of them, and her instincts were right. She sat with Eileen and gently shared that she noticed her medical history, asking, "Is someone making you do things

you don't want to do?" Without looking up, Eileen explained that a man was forcing her to have sex with other people and to use drugs to make her "spaced out enough to be able to do it." Eileen did not have to say the exact words for Nurse Strong to know Eileen was being trafficked. Nurse Strong followed the hospital protocol for reporting. She referred Eileen to a safe house and connected her with resources to help her build a new life.

A community crisis can be extremely challenging for the people directly affected. It can include individuals, local families, workers, businesses, industries, and the community. As nurses, listening to the voices of the people impacted by the crisis is essential to build trust, foster resilience, and facilitate recovery. One only needs to watch the global news media to recognize an exponential number of communities in crisis—from both natural and human causes. This ongoing expansion requires a simultaneous evolutionary adaptation in nursing education, practice, research, and policy to ensure that all nurses—from front-line professionals to researchers—have the baseline knowledge, skills, abilities, and autonomy to protect populations at greatest risk and improve the readiness, safety, and support of the nursing workforce.

31.1 Trauma-Informed Care

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 31.1.1 Define trauma-informed care (TIC).
- 31.1.2 List the six key elements to TIC.
- 31.1.3 Demonstrate how the nurse can utilize TIC during a crisis.

Trauma-informed care (TIC) is a therapeutic approach that acknowledges trauma's long-lasting emotional, neurological, psychological, social, and biological effects on a person's present and future health. For many people, adverse childhood experiences ([ACEs \(<https://openstax.org/r/violenceprevention>\)](https://openstax.org/r/violenceprevention)) ultimately hinder emotional, social, and even physical health, even if they seem unrelated to present problems (Centers for Disease Control and Prevention [CDC], 2023a). Trauma-informed care is unique as it reimagines the client-therapist relationship as a partnership. The nurse or therapist provides support throughout a client's journey of healing and growth, using six guiding principles that ensure every interaction is mindful and aware. However, first and foremost, at the core of trauma-informed care is the tenet of *primum non nocere*, which translates from Latin as "first, do no harm" (Sommers-Flanagan & Sommers-Flanagan, 2021).

Six Key Elements to Trauma-Informed Care

The CDC and the Substance Abuse and Mental Health Services Administration (SAMHSA, 2020) collaborated to develop six principles for TIC that negate the potential for re-traumatizing the client. These core principles are safety, trustworthiness and transparency, peer support, collaboration and mutuality, empowerment and choice, and cultural, historical, and gender issues ([Table 31.1](#)).

Principle	Definition
Safety	<ul style="list-style-type: none"> • Providing nonjudgmental, unconditional, positive regard during all interactions and encouraging client expression of safety needs, values, and perspective to ensure physical and emotional safety.
Trustworthiness and transparency	<ul style="list-style-type: none"> • Making tasks clear and maintaining appropriate boundaries. For example, demonstrating ongoing acceptance and empathy while encouraging a client's complex reflections of feeling. • Continuously clarifying the role of the clinician while providing autonomy of the client.
Peer support	<ul style="list-style-type: none"> • Promoting both peer support and self-help services that provide safety and hope.
Collaboration and mutuality	<ul style="list-style-type: none"> • Partnering and leveling power among the client as consumer and health care as provider. • Allowing the client control over treatment and recovery. • Examples include eliciting input, asking permission, and asking questions.

TABLE 31.1 The Six Principles of Trauma-Informed Care (See CDC, 2020b.)

Principle	Definition
Empowerment and choice	<ul style="list-style-type: none"> Promoting client-centered recovery with an understanding of power differentials. Using shared decision-making, choice, and goal setting. Using self-advocacy and the client's unique concept of recovery. Examples include a focus on change talk, a focus on client strengths and values, evocative questions, and an emphasis on client personal choice and autonomy.
Cultural, historical, and gender issues	<ul style="list-style-type: none"> Offering services sensitive to the gender, culture, and unique background of the client. Examples include emphasis on personal choices and control and focus on client autonomy.

TABLE 31.1 The Six Principles of Trauma-Informed Care (See CDC, 2020b.)

A printable infographic of “6 Guiding Principles to a Trauma-Informed Approach” is available from the CDC and SAMHSA [here \(https://openstax.org/r/infographics\)](https://openstax.org/r/infographics).

The CDC and SAMHSA note that a trauma-informed approach is not accomplished through a single technique or checklist. A trauma-informed approach requires constant attention, caring awareness, sensitivity, and possibly a cultural change at an organizational level. An internal organizational assessment and quality improvement, as well as engagement with community partners, will help to embed this approach, which can be augmented with organizational development and practice improvement. However, with thoughtful intention by the nurse, it is easy to generalize and apply the six core principles across the various clinical settings where clients may receive treatment.

The Role of Nurses and Trauma-Informed Care in Clinical Practice

A nurse can apply the principles of TIC in daily interactions with all clients. TIC requires a nurse to be mindful, sensitive, and responsive; to be sensitive to the impact of trauma on others and oneself; to understand and use tools to support self and others during times of stress; and to identify and support the system change needed to reduce re-traumatization. In alignment with the principles of safety, respect, and trust, nurses can ask themselves three simple questions as a first step to applying a trauma-informed lens to their practice (Fleishman et al., 2019):

Safety: Does this cultivate a sense of safety?

Respect: Am I, and are others, showing respect?

Trust: Does this build trust?

The nurse can mindfully employ strategies in their daily practice to engender trustworthiness, transparency, empowerment, and the other facets of TIC; for example (Fleishman et al., 2019):

- Introduce yourself and your role in every client interaction: When a client understands who you are and your role in their care, they can feel empowered to be more actively engaged in their own care.
- Use open and nonthreatening body positioning: Using nonthreatening body positioning helps prevent the threat-detection areas of the brain from taking over, which helps clients stay regulated.
- Ask before touching: Asking permission before you touch clients gives them a choice and empowers them to have control over their body and physical space.
- Protect client privacy: Protect client privacy and safety by ensuring that the client desires those present to hear about their care. This ensures compliance with the HIPAA Privacy Rule (U.S. Department of Health and Human Services [HHS], 2022).
- Use plain language and teach-back: Using clear language and teach-back empowers clients with knowledge and understanding about their care.

For a health care system to thoroughly implement and embody TIC, policies, procedures, and culture need to be trauma-informed. Nurses who utilize a trauma-informed approach in clinical practice can enhance job satisfaction, reduce risk for burnout, and improve client experiences and outcomes (Wolotira, 2023).

Access multimedia content (<https://openstax.org/books/population-health/pages/31-1-trauma-informed-care>)

In this video, nurse Cheryl Martin describes trauma-informed care in her community as a responsive approach to providing care for individuals who have experienced trauma.

Watch the video, and then respond to the following questions:

1. How would you distinguish positive stress, tolerable stress, and toxic stress?
2. What are some examples of how people respond to toxic stress? Why might each individual respond differently to a similar situation?
3. How would you describe a “safe environment”? What is the nurse’s role in creating a safe environment for clients?
4. Cheryl Martin makes the point that only the client is the “expert” about their own disease. Why is this viewpoint essential for providing TIC?

CASE REFLECTION

Practicing Trauma-Informed Care

Read the scenario, and then respond to the questions that follow.

Nellie, 21, is a survivor of interpersonal violence. After successfully transitioning from an abusive household to a shelter, Nellie lives independently in rent-assisted housing. She is employed as a waitress at a local restaurant. However, she struggles with chronic headaches and neck pain from past abuse by her former boyfriend, who repeatedly beat her and tried to strangle her while he was intoxicated. Since becoming a “survivor,” Nellie frequently visits the local clinic for follow-up appointments related to these past injuries. After enduring this physical and emotional abuse, she has misused substances for both anxiety and pain. Nellie wants her physical and emotional pain to go away and wants the nurse to convince the doctor to write her prescriptions because she has been “cut off” and finds the “talk therapy” that they want her to go to to be too “scary and emotional to deal with.”

1. Why is it important for Nellie to feel that she is in a safe space? What can the nurse do to facilitate this?
2. How might the nurse use a TIC approach to open a dialogue with Nellie to find out what she really needs?
3. What alternate pain-management techniques might the nurse suggest for Nellie?

31.2 The Mental Health Crisis

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 31.2.1 Describe the state of mental health in the United States.
- 31.2.2 Examine the origins of the U.S. mental health crisis.
- 31.2.3 Describe why mental health conditions are increasing worldwide.
- 31.2.4 Assess the effect of stigma, prejudice, and discrimination against people with mental illness.
- 31.2.5 Discuss the nurse’s role in addressing the mental health crisis to uphold nursing’s societal mission.

In the United States, mental health illnesses have become an epidemic—considered a **mental health crisis**—with nearly one in five people (47.1 million) diagnosed with a mental health condition, constituting an increase of 1.5 million from 2022 (Mental Health America [MHA], 2023). Rates of suicidal ideation (SI), also called suicidal thoughts or ideas, a broad term used to describe a range of contemplations, wishes, and preoccupations with death and suicide, are highest among youth, especially those who identify as LGBTQ+ (Harmer et al., 2023; SAMHSA, 2020; The Trevor Project, 2022). In September 2020, over half of all 11- to 17-year-olds reported having thoughts of suicide or self-harm more than half of or nearly every day of the previous 2 weeks. According to MHA (2023):

- Nearly 78,000 youth reported experiencing frequent suicidal ideation, including nearly 28,000 LGBTQ+ youth.
- Over half (54.7 percent) of adults with a mental illness reported that they do not receive treatment, totaling over 28 million individuals.
- Almost a third (28.2 percent) of all adults with a mental illness reported that they were not able to receive the treatment they needed.

- 42 percent of adults with mental illness reported they were unable to receive necessary care because they could not afford it.
- 10.8 percent (over 5.5 million) of adults with a mental illness are uninsured.
- 59.8 percent of youth with major depression do not receive any mental health treatment.

In the United States, there are an estimated 350 individuals for every one mental health provider; however, these figures may overestimate active mental health professionals, as they may include providers who are no longer practicing or accepting new clients (MHA, 2023).

THE STATE OF MENTAL HEALTH IN AMERICA REPORT

Mental Health America (MHA), the nation's leading national nonprofit dedicated to the promotion of mental health, well-being, and illness prevention, publishes the annual *State of Mental Health in America Report*, providing a yearly snapshot of the prevalence of mental health conditions and a baseline for future legislation on mental health parity (MHA, 2023). Operating nationally and in communities across the United States, MHA advocates for closing the mental health equity gap while increasing nationwide awareness and understanding through public education, direct services, tools, and research. The State of Mental Health in America Report ranks all 50 states and the District of Columbia based on 15 mental health prevalence and access measures for youth and adults.

Explore the [Ranking of the States 2022 \(<https://openstax.org/r/mhanational>\)](https://openstax.org/r/mhanational) to find information about your state, and then respond to the following questions.

1. Where does your state rank in terms of the prevalence of mental illness?
2. Where does your state rank for the prevalence of adults with substance use disorder in the past year?

You may also download the printable report [The State of Mental Health in America 2023 \(<https://openstax.org/r/mhanationalo>\)](https://openstax.org/r/mhanationalo).

The Origins of the U.S. Mental Health Crisis

According to a White House briefing, “our country faces an unprecedented mental health crisis among people of all ages.” Specifically, “two out of five adults report symptoms of anxiety or depression. And, Black and Brown communities are disproportionately undertreated—even as their burden of mental illness has continued to rise” (The White House, 2022). Even before the COVID-19 pandemic, rates of depression and anxiety were rising. Loneliness and social isolation during the pandemic exacerbated these trends, with increasing numbers of children reporting thoughts of suicide and self-harm.

Mental health services in the United States are insufficient to address this crisis. A majority of Americans (76 percent) report that they consider mental health as important as physical health, and more than half of Americans (56 percent) seek mental health services (National Council for Mental Wellbeing, n.d.). Americans seeking these services tend to be younger, with lower incomes, and often from military backgrounds. Among Americans seeking treatment, 96 million (38 percent) have had to wait over a week for mental health treatments. A National Council for Mental Wellbeing study found that a large percentage of Americans want to seek treatment for mental health issues for themselves or loved ones but have not done so in part because they do not know where to go. What’s more, 53 million American adults (21 percent) have wanted to see a mental health professional but were unable to for reasons outside of their control including lack of insurance, an available provider, transportation (private or public), and child care, as well as geographical isolation, conflicting work or school schedules, or domestic violence issues. Gen Z (born between 1997 and 2012) and millennial (born between 1981 and 1996) Americans are less sure about available resources for mental health services compared to older generations. The National Council for Mental Wellbeing study suggests that these younger generations are also more likely to find it difficult to distinguish legitimate mental health resources online, turning instead to unreliable social media resources, including Facebook, YouTube, and Twitter, for information (National Council for Mental Wellbeing, n.d.).

HEALTHY PEOPLE 2030

Mental Health and Mental Health Disorders

A focal point for the Healthy People 2030 initiative is addressing public health priorities and challenges related to [mental health and mental health disorders \(https://openstax.org/r/healthypeopleob\)](https://openstax.org/r/healthypeopleob). Recognizing that about half of all people in the United States will be diagnosed with a mental disorder at some point in their lifetime, *Healthy People 2030* focuses on the prevention, screening, assessment, and treatment of mental disorders and behavioral conditions. The Mental Health and Mental Disorders objectives also aim to improve health and quality of life for people affected by these conditions.

The Ongoing Global Expansion of a Mental Health Crisis

Behavioral health disorders are on track to become the number-one cause of disability worldwide, surpassing all other illnesses. For example, one in four people globally experience mental disorders, more than those with cancer, diabetes, or heart disease (Clubhouse International, 2023). Half of those with mental disorders begin to show signs of the disease by age 14 but often take more than 10 years to get treatment (National Alliance on Mental Illness [NAMI], 2023). Worldwide, suicide has become a global epidemic with 90 self-directed deaths every hour, which calculates to nearly 2,200 people/day, 800,000/year. Ninety percent of these suicides are directly related to mental health disorders (World Health Organization [WHO], 2019, 2022a).

Globally, mental illness (MI) now accounts for 30 percent of the overall burden of the health care industry, yet only 3 percent of the world's health care budget goes toward providing mental health care services (WHO, 2016). This imbalance highlights the need for nurses to be savvy in mental health assessment and treatment strategies.

The Effects of Stigma, Prejudice, and Discrimination on Mental Health

The social stigma associated with mental health continues to be a barrier to seeking help (American Psychiatric Association, 2023). In this context, stigma refers to negative attitudes that disparage a person with a mental health condition. This stigma causes many individuals to delay seeking treatment. According to a National Council for Mental Wellbeing study (n.d.), nearly one-third of Americans, or 31 percent, have worried about others judging them when they told them they have sought mental health services, and over a fifth of the population, or 21 percent, have lied to avoid telling people they were seeking mental health services. Stigma is an especially acute problem among younger Americans. Among respondents in a National Council for Mental Wellbeing study, 49 percent of Gen Z respondents (born between 1997 and 2012), 40 percent of millennial respondents (born between 1981 and 1996), 30 percent of Gen X respondents (born between 1965 and 1980), and 20 percent of baby boomer respondents (born between 1946 and 1964) indicated that they have worried about others judging them when they say that they have sought mental health services.

Stigma often comes from lack of understanding or fear. Inaccurate or misleading representations of mental illness contribute to both of those factors. A review of studies on stigma shows that while the public may accept the medical or genetic nature of a mental health disorder and the need for treatment, many people still have a negative view of those with mental illness.

According to the American Psychiatric Association (2023), researchers identify different types of stigma:

- **Public stigma** involves the negative or discriminatory attitudes that others have about mental illness.
- **Self-stigma** refers to the negative attitudes, including internalized shame, that people with mental illness have about their own condition.
- **Institutional stigma**, which is more systemic, involves government and private organizations' policies that intentionally or unintentionally limit opportunities for people with mental illness. Examples include lower funding for mental illness research or fewer mental health services than other health care services.

General **prejudice**, a preconceived negative opinion not based in facts, toward people with MI may predispose people to dislike and/or disrespect others with a specific diagnosis, such as schizophrenia or depression (American Psychiatric Association, 2023). Prejudiced attitudes toward people with MI range from discomfort with having them as a neighbor to avoiding someone because of their diagnosis. Researchers studying prejudice and MI identified four

dimensions underlying prejudice: *fear/avoidance* (fear of people with MI and the desire for social distance from them), *unpredictability* (belief that the behavior of people with MI is unpredictable), *authoritarianism* (belief in the need to control people with MI), and *malevolence* (lack of benevolent attitudes and belief in inferiority of people with MI) (Kenny et al., 2018).

Discrimination, unfair treatment based on irrelevant characteristics, is an ongoing challenge for those diagnosed with MI. Americans are familiar with the idea that refusing employment to a person based on their gender, race, or sexuality is unfair and amounts to sexism, racism, or homophobia. Although discrimination based on MI can be more subtle, it negatively affects the individual's quality of life and career. According to the Americans with Disabilities Act National Network (2023), discrimination based on mental illness includes:

- Terminating an employee based on the discovery of their MI
- Assigning an employee bad or inconvenient shifts or assignments
- Making insulting jokes about the MI
- Failing to make reasonable accommodations for the employee with MI
- Offering only poor working conditions
- Not allowing the employee to miss work for medical appointments
- Not allowing the individual enough time to complete tasks

Stigma, prejudice, and discrimination directly affect individuals with MI and the loved ones who support them. In some communities, MI stigma is a barrier to obtaining mental health services. For example, in some Asian cultures, seeking professional help for MI may be counter to values of strong family, emotional restraint, and avoiding shame (NAMI, 2019). Distrust of the mental health care system prevents individuals from certain racial and ethnic groups from seeking care; this is often seen in Black communities (African American Wellness Project, 2023).

CONVERSATIONS ABOUT CULTURE

Mental Health = Health for Diverse Communities

[Access multimedia content \(<https://openstax.org/books/population-health/pages/31-2-the-mental-health-crisis>\)](https://openstax.org/books/population-health/pages/31-2-the-mental-health-crisis)

This video provides an overview of mental health and mental illness, describing some persistent myths about the causes of mental illness and the role culture plays in seeking treatment.

Watch the video, and then respond to the following questions.

1. What is the difference between mental health and mental illness?
2. What are two commonly held cultural myths regarding mental health?
3. What two effects can mental health stigma have on a person's life?

The Nurse's Role in Addressing the Mental Health Crisis

Nurses are in a unique position to recognize mental health concerns, as they are often the first to connect with a client and can swiftly establish rapport with them, starting all interactions using the steps of the TIC Approach. As trusted advocates, nurses can provide the compassion that clients may need at a difficult time and can help them access treatment. Nurses must be aware of the potential impact of stressors on their clients and how these may manifest in a crisis. Population health nursing focuses on the common good of the population in addition to individual client health. The public health/community health nurse may work with individuals, families, and groups to implement changes to mental health services that affect an entire community or population.

Nurses use a systematic process to assess health status, identify resources, and develop programs to improve mental health in communities. The first step is to create a therapeutic nurse-community (as client) relationship. The nurse establishes an understanding of who the community as client is, what is occurring in their lives, and what resources are available by assessing demeanor, beliefs, and support systems to determine if a specific health issue or environmental situation is progressing to a crisis state. Crisis intervention is an important role for the nurse and health care team, as they can work swiftly to develop effective resolutions. During the crisis intervention process, the client develops new skills and coping strategies, resulting in change. A crisis state is time-limited, usually lasting

several days but no longer than 4 to 6 weeks. Using the nursing process in crisis resolution planning, nurses implement therapeutic interventions based on the stage of the crisis to assist the individual.

The foundational goals of crisis intervention include (Caplan, 1964):

- Identification, assessment, and intervention
- Swift return to a prior level of functioning
- Lessening negative impact on future mental health

Various factors can influence an individual's ability to resolve a crisis and return to equilibrium, such as realistic perception of an event, adequate situational support, and adequate coping strategies to respond to a problem.

THE ROOTS OF HEALTH INEQUITIES

Social Determinants of Health and Mental Health Crisis in the United States

Social determinants of health (SDOH) are conditions in which people are born, grow, learn, work, play, and age that affect their health risks and outcomes. Social factors affect risk for mental illnesses and substance use disorders, as well as health outcomes of persons with these disorders. The NAMI article [Ways We Can Address the Social Determinants of Mental Health](https://openstax.org/r/namiorgBlo) (<https://openstax.org/r/namiorgBlo>) provides a useful overview for conceptualizing the relationship between the social determinants of health and mental health and provides recommendations for health care professionals. A focus on social determinants of health can lead to better mental health outcomes, including preventing mental illness. All nurses have a role to play in addressing the SDOH. This article provides several examples of social determinants of health and potential ways to address them.

(See Pointe, 2020.)

SAFE-T: SUICIDE ASSESSMENT FIVE-STEP EVALUATION AND TRIAGE FOR CLINICIANS

The community health nurse can use the following guidelines to perform a brief suicide assessment that uses a five-step evaluation and triage plan to identify risk factors and protective factors, conduct a suicide inquiry, determine risk level and interventions, and develop a treatment plan. Suicide assessments should be conducted at first contact with all mental health clients and at repeated intervals for those with any subsequent suicidal behavior, increased suicide ideation, or pertinent clinical change; if being used for inpatients, this assessment would additionally be conducted prior to increasing unsupervised privileges and at discharge.

1. Identify Risk Factors: Note those that can be modified to reduce risk
2. Identify Protective Factors: Note those that can be enhanced
3. Conduct Suicide Inquiry: Suicidal thoughts, plans, behavior, and intent
4. Determine Risk Level/Intervention: Determine risk; choose appropriate intervention to address and reduce risk
5. Document: Assessment of risk, rationale, intervention, and follow-up

Read all of the detailed teaching guidelines and find all of the resources at [Suicide Assessment Five-Step Evaluation and Triage](https://openstax.org/r/samhsago) (<https://openstax.org/r/samhsago>).

Nurses can also download SAMHSA's Suicide Safe mobile app (<https://openstax.org/r/samhsagoa>).

31.3 The Opioid Epidemic and Substance Use Disorders

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 31.3.1 Describe the United States opioid epidemic.
- 31.3.2 Explain how the opioid epidemic arose in the United States.
- 31.3.3 Identify how stigma impacts people with opioid use disorder and health outcomes.
- 31.3.4 Apply the role of the nurse upholding nursing's mission to society in addressing the opioid epidemic.

Substance use disorders (SUDs) are chronic, relapsing, potentially deadly conditions that occur when the recurrent problematic use of substances impairs an individual's health and ability to function to meet vocational, academic, social, or personal responsibilities (CDC, 2022e; Stone et al., 2021). SUDs range in severity, duration, and complexity and are classified as mild, moderate, or severe based on the criteria defined in the *Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition* (DSM-5) (Stone et al., 2021). SUDs and other mental health disorders can be co-occurring (NIMH, 2023). The National Institute of Mental Health has identified three possibilities to explain why SUDs and other mental disorders may occur together:

- Common risk factors (e.g., genetics, stress, trauma, social and environmental factors)
- Brain changes in people with mental disorders, which may heighten the rewarding effects of substance use
- Substance use may trigger changes in brain structure and function, making an individual more likely to develop a mental disorder (NIMH, 2023)

Accidental drug overdose is now the leading cause of accidental deaths in the U.S., largely due to the opioid epidemic (CDC, 2022d). **Opioids** accounted for 75 percent of all drug overdoses deaths in 2020 (CDC, 2022a). Synthetic opioids have caused overdose deaths, primarily linked to fentanyl manufactured by illicit means, increasing the risk of overdose (CDC, 2020a). The risk of overdose is high with any use of illicitly manufactured fentanyl, as fentanyl is up to 50 times stronger than heroin (Congressional Research Service [CRS], 2022). This risk is increased among individuals who are **opioid naïve**, meaning they are not receiving opioids on a daily basis, or those whose tolerance to opioids has decreased following periods of abstinence (Baldwin et al., 2021).

Roots of the Opioid Epidemic

The CDC describes the rise of the opioid epidemic as a series of three waves corresponding with overlapping factors that accelerated surges in deaths from substance use in the United States ([Figure 31.2](#)) (CDC, 2022f).

1. First wave (1990s): Health care professionals' increased prescribing of prescription opioids, including natural opioids, semi-synthetic opioids, and methadone, resulted in overdose deaths which steadily grew through the year 2016 (CDC, 2022f).
2. Second wave (2007): Rapid increases in Mexican production led to greater availability of low-cost heroin to the United States (CRS, 2022). In 2015, overdose deaths involving heroin surpassed the number of deaths related to opioid pills (CDC, 2022f).
3. Third wave (2013): Illicitly manufactured fentanyl became available (CDC, 2022f; CRS, 2022). By 2016, fentanyl and tramadol overdose deaths in the United States surpassed those from heroin and prescription drug misuse (CRS, 2022). Illicitly manufactured fentanyl continues to evolve, with its widespread availability in combined formulations including heroin, counterfeit pills, and cocaine (CDC, 2022f).

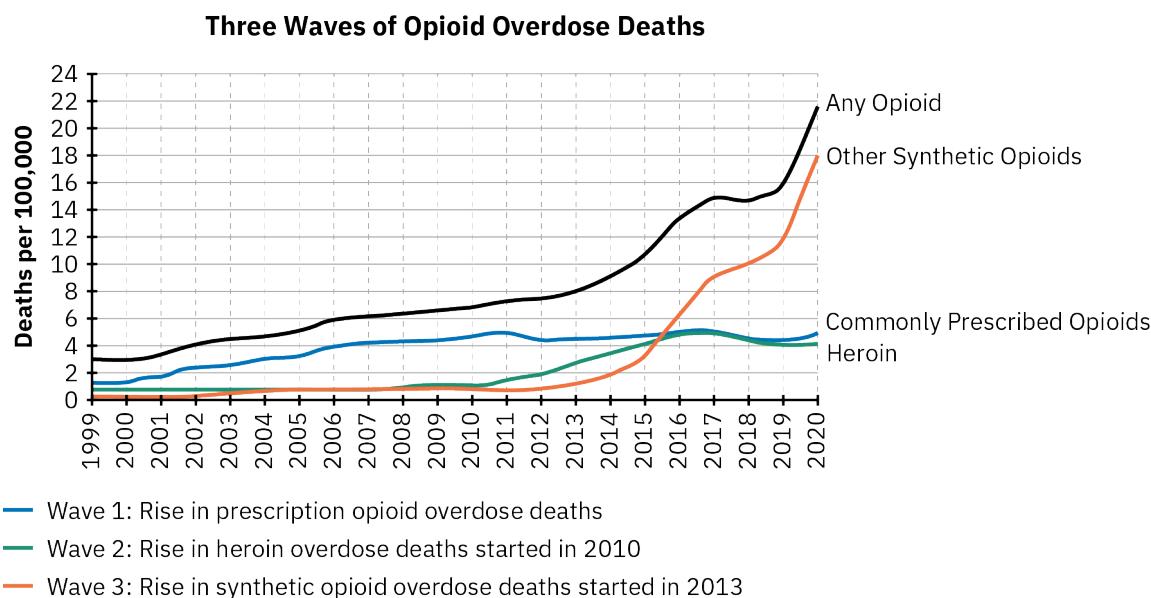

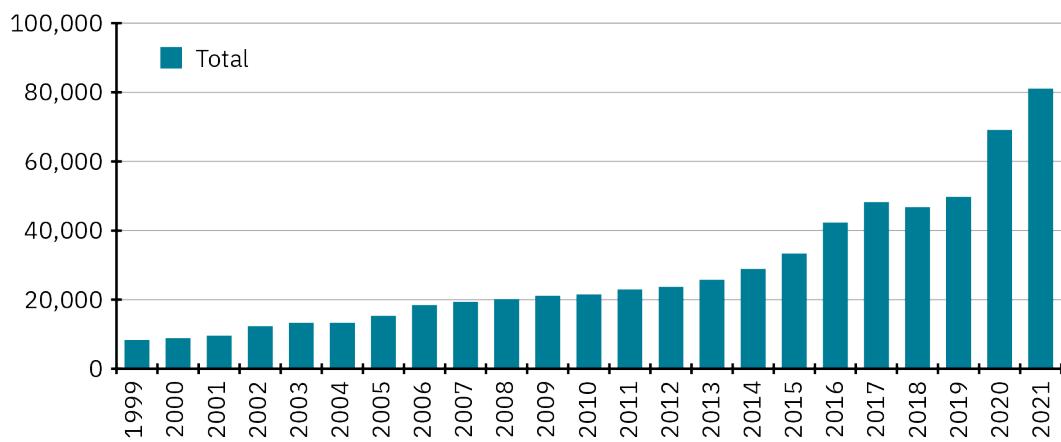

FIGURE 31.2 The rise in opioid overdose deaths in the United States can be outlined in three distinct waves. (data source: CDC, 2022f; attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

U.S. drug overdose deaths accelerated at the height of the COVID-19 pandemic (2020 to 2022), as social isolation, unemployment, and reduced access to drug treatment and recovery support services damaged mental health (CDC, 2020). The stress and social isolation of the pandemic led to increased substance use (Figure 31.3) (Baldwin et al., 2021; CDC, 2020). Synthetic opioid deaths continue to climb, while opioid pill and heroin overdose deaths have slackened but remain at high levels (CDC, 2022f; Ciccarone, 2019).

National Overdose Deaths Involving Any Opioid*, All Ages, 1999–2021

*Among deaths with drug overdose as the underlying cause, the “any opioid” subcategory was determined by the following ICD-10 multiple cause-of-death codes: natural and semi-synthetic opioids (T40.2), methadone (T40.3), other synthetic opioids (other than methadone) (T40.4), or heroin (T40.1).

FIGURE 31.3 U.S. overdose deaths involving any opioid increased dramatically from 1999 to 2021. (data source: National Center for Health Statistics, 2021; attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

HEALTHY PEOPLE 2030

Addiction

Recognizing that SUDs are linked to multiple health problems and result in overdose and death, Healthy People 2030 provides [evidence-based resources and strategies to prevent SUDs](https://openstax.org/r/healthypeoplea) (<https://openstax.org/r/healthypeoplea>) at the school, family, and community levels.

The Impact of Stigma on SUDs

Addressing stigma is critical to combating the opioid crisis, as stigma is attached to SUDs and addiction (McGinty & Barry, 2020). Research demonstrates a pervasive stigma in U.S. culture that addiction is a personal choice, reflecting a lack of willpower and a moral failing (McGinty & Barry, 2020). Research has demonstrated that people identified with SUDs are perceived as more blameworthy and dangerous compared to individuals labeled with mental illness (van Boekel et al., 2013). Such stereotypes often lead to less helping behavior and more avoidance of people with drug addiction than of those with mental illness (van Boekel et al., 2013). Stigmatizing beliefs predispose negative attitudes about addiction and target certain races and socioeconomic classes (McGinty & Barry, 2020). Bias may assume an individual's poor personal choices led to their SUD instead of social factors such as poverty, a history of trauma, or structural barriers to accessing effective treatments (McGinty & Barry, 2020).

Studies show people with SUDs face negative labeling and stereotyping, status loss, and discrimination (McGinty & Barry, 2020; National Institute on Drug Abuse [NIDA], 2023b). This stigma can discourage people who need help from seeking care (NIDA, 2023b). The language that people, including health care professionals, use to describe SUDs can contribute to stigma and discrimination against people with these conditions (NIDA, 2023b). Changing the culture, attitudes, and practices around substance use is essential to lasting health care reform (HHS, 2016). This includes creating a society where people who need help feel comfortable seeking it and where health care professionals and population health nurses treat clients with SUDs with the same level of compassion and care as they would clients with any other chronic disease. It also means facilitating a mindset that everyone can offer the care and support needed to ensure a meaningful difference in someone's recovery (HHS, 2016).

THEORY IN ACTION

Stigma and Substance Use Disorder

[Access multimedia content \(<https://openstax.org/books/population-health/pages/31-3-the-opioid-epidemic-and-substance-use-disorders>\)](https://openstax.org/books/population-health/pages/31-3-the-opioid-epidemic-and-substance-use-disorders)

This American Heart Association video discusses the need to destigmatize drug use to minimize the negative effects of discriminatory and inaccurate perceptions on individuals with SUDs and related conditions.

Watch the video, and then respond to the following questions.

1. What are some factors that influence the stigma of SUDs?
2. How can nurses decrease barriers to care for individuals with SUDs?
3. What innovative strategies can nurses develop to eliminate stigma in their organizations or personal interactions with clients with SUDs?
4. Reflect on your feelings, attitudes, and experiences with individuals with SUDs and describe how you can promote change in destigmatizing SUDs.

Addressing the Opioid Crisis

The opioid crisis affects Americans of all ages, ethnicities, socioeconomic classes, and geographic areas. With the notable increase in Americans dying from opioid-involved overdoses, multiple legal, social, and public health efforts have ensued to curb opioid misuse and drug-related overdose deaths (CRS, 2022). Collaborative multidisciplinary strategies must address barriers to care, effective legislation and regulation, equitable evidence-based interventions, and awareness and education initiatives among communities nationwide.

SUDs Prevention

Prevention strategies at the school, family, and community levels are key to reducing SUDs, with interventions to accelerate treatment to reduce opioid-related deaths (ODPHP, n.d.-a). The CDC outlines six principles and five strategic priorities rigorously applied to research and evaluation projects to reduce overdoses and substance use-related harms. Nurses can apply these guidelines by promoting evidence-based strategies to ensure the delivery and implementation of effective methods to prevent and reduce overdose and substance use-related harms for diverse audiences and settings (CDC, 2022c). To strengthen efforts to reduce drug overdoses, public health nurses can build multidisciplinary partnerships to collaborate with public safety and community

organizations at national, state, and local levels (CDC, 2022c). See [Table 31.2](#).

The CDC's Six Guiding Principles to Address the Overdose Crisis	
1. Promote Health Equity	Ensure equitable opportunity to prevent overdose and substance use-related harms by resolving health disparities related to the overdose crisis. Promote interventions that advance health equity in all communities.
2. Address Underlying Factors	Identify harmful and protective factors to better design interventions to address the overdose crisis, while attending to health disparities and inequities.
3. Partner Broadly	Form broad and diverse partnerships as a foundation of preventing overdose and substance use-related harms that include opportunities to develop, coordinate, and implement targeted strategies to prevent harm.
4. Take Evidence-Based Action	Promote evidence-based action to ensure the delivery of effective methods for preventing and reducing overdose and substance use-related harms that are translated and adapted for diverse populations.
5. Advance Science	Build the evidence base for what is most effective to end the overdose crisis by: <ul style="list-style-type: none"> • advancing science through supporting public health surveillance • identifying risk and protective factors • developing and evaluating prevention strategies • ensuring effective communication strategies that are adapted for diverse audiences
6. Drive Innovation	Promote the generation, implementation, evaluation, and widespread adoption of new and innovative ideas to address the overdose crisis.

TABLE 31.2 The CDC's work is guided by six principles to address the overdose crisis (See CDC, 2022d).

The CDC's prevention framework includes five [strategic priorities](https://openstax.org/r/drugoverdose) (<https://openstax.org/r/drugoverdose>) in response to the overdose crisis:

- Monitor, Analyze, and Communicate Trends
- Build State, Tribal, Local, and Territorial Capacity
- Support Providers, Health Systems, Payors, and Employers
- Partner with Public Safety and Community Organizations
- Raise Public Awareness and Reduce Stigma

Government Efforts

Federal, state, and local governments have mandated legal and policy initiatives to curb opioid misuse and drug-related overdose deaths in the United States (CRS, 2022). Congress has enacted laws that prevent the overprescribing and misuse of opioids, reduce capabilities for domestic diversion and illicit trafficking, and curtail foreign supply with sanction efforts (CRS, 2022). The federal government has also increased the appropriation of funds to expand the availability of substance use prevention, treatment, and recovery services (CRS, 2022). Federal funding supports evidence-based initiatives to reduce opioid use, such as medication-assisted treatment (MAT), peer recovery networks, and harm-reduction strategies, such as needle exchange programs and the distribution of naloxone to reverse opioid overdoses (CRS, 2022). Community efforts are discussed further in the next section.

Community Efforts

The community plays a crucial role in the public health response to the opioid epidemic (Worcester County Health Department, 2019). The SAMHSA publication (2022) [Community Engagement: An Essential Component of an Effective and Equitable Substance Use Prevention System](https://openstax.org/r/samhsagov) (<https://openstax.org/r/samhsagov>) outlines the community's role in reducing substance misuse. Communities can increase participation in these efforts by schools and community agencies and provide educational programs targeting high-risk, vulnerable individuals and populations using community resources ([Figure 31.4](#)). Local boards of education have piloted multidisciplinary instructional units on prescription opioids and heroin with middle-school students, teaching them how opioids and heroin affect the brain, its chemistry, and the societal impacts of addiction (Worcester County Health Department, 2019). Such approaches are promising prevention strategies to maximize harm reduction (HHS, 2016).

FIGURE 31.4 As part of a recovery program, this Navy veteran in Wisconsin began creating his own art after failing to find photos or images that enabled him to express his feelings and emotions. (credit: “Sketching A Path Toward Recovery” by Benjamin Slane/Flickr, Public Domain)

Other examples of community efforts include prescription drug monitoring programs (PDMPs), which have reduced opioid prescribing, multiple provider episodes (“doctor shopping”), and opioid-related overdose deaths in states where they are mandated. Free sterile needle and syringe programs and other support services, such as counseling and testing for sexually transmitted infections (STIs), have dramatically reduced disease transmission. For example, studies have demonstrated that needle/syringe exchange programs effectively reduce HIV transmission and do not increase rates of community drug use (HHS, 2016).

Naloxone is an FDA-approved opioid antagonist medication that effectively reverses opioid overdose (HHS, 2016). Education and the distribution of naloxone to at-risk individuals and their families, public health nurses, emergency medical technicians, police officers, other first responders, and community-based opioid overdose prevention programs has saved countless lives (HHS, 2016).

In addition to financially investing in community-based efforts, urban areas are improving access to treatment and housing by engaging and supporting impacted communities (Syed, 2023). For example, Philadelphia has increased the availability of permanent housing opportunities to support people experiencing homelessness at different stages of recovery and piloted the first licensed mobile wound-care van in Pennsylvania by expanding mobile outreach teams citywide (Syed, 2023).

In contrast, rural communities experience a disproportionately high burden from the opioid crisis (Palombi et al., 2019). An effective grassroots approach to rural community engagement involves collaborative teams composed of community members, public health professionals, university faculty, law enforcement, and medical professionals, among others, that convene from the bottom up through community coalitions and forums (Palombi et al., 2019). Coalitions in Minnesota have raised awareness and galvanized community efforts around diverse topics including substance misuse, syringe exchanges, and naloxone distribution (Palombi et al., 2019). As depicted in the video, [America Addicted \(<https://openstax.org/r/communityoverwhelmed>\)](https://openstax.org/r/communityoverwhelmed), the ongoing challenges of the opioid crisis are overwhelming community efforts to curb opioid overdoses. A collaborative government and community effort is needed to create substance-free communities that address social determinants of health (Palombi et al., 2019).

THE ROOTS OF HEALTH INEQUITIES

Social Determinants of Health, Disparities, and Substance Use

Research is ongoing to explore how the interaction of biological and social factors may contribute to an individual's increased vulnerability to be at risk for developing SUDs (Amaro et al., 2021). Chronic exposure to stressors such as poverty, food and housing insecurity, racism, and health inequities may underpin a maladaptive stress response, resulting in physical dependence and SUDs (Amaro et al., 2021). This [article](https://openstax.org/r/sciencedirect) (<https://openstax.org/r/sciencedirect>) from the journal *Neuropharmacology* explores how the stress of these social determinants of health play a critical role in creating vulnerability to substance use (Amaro et al., 2021). (See Amaro et al., 2021.)

SUDs Treatment

Individuals with SUDs have historically received treatment through mental health services or substance use disorder treatment programs (HHS, 2016). As discussed, the demand in the United States for mental health services often exceeds the supply (Kuntz, 2022). Increasingly, primary or general health care practices are involved in delivery of treatment (HHS, 2016). Increasing nonopioid pain management of minor procedures, like dental rehabilitation, and of health conditions, like muscle strains, can minimize opioid exposure and dependency. The most effective treatment for opioid use disorders is medication-assisted treatment (MAT), which can combine pharmacologic agents and counseling or behavioral therapy and other support services (HHS, 2016). Successful MAT programs for opioid addiction have been shown to decrease overdose deaths, be cost-effective, reduce transmissions of HIV and hepatitis C related to IV drug use, and moderate associated criminal activity (HHS, 2016).

MEDICATIONS FOR OPIOID USE DISORDER

[Access multimedia content \(<https://openstax.org/books/population-health/pages/31-3-the-opioid-epidemic-and-substance-use-disorders>\)](https://openstax.org/books/population-health/pages/31-3-the-opioid-epidemic-and-substance-use-disorders)

This National Institute on Drug Abuse video describes medications for opioid use disorder (MOUD) and how they work. These medications can support recovery and improve health by reducing cravings, easing withdrawal symptoms, and possibly reversing an opioid overdose (NIDA, 2021). Pharmacotherapy for SUDs can be used alone or as part of a larger treatment plan (NIDA, 2021). These medicines are safe and effective and can save lives (NIDA, 2021).

Watch the video, and then respond to the following questions.

1. Which medication is commonly used in treatment programs for substance use disorders to produce a noneuphoric state and to replace opioid use?
2. Which medication is most appropriate for the treatment of a client with SUDs after the opioids have been completely cleared from their body?
3. Why must a community health or public health nurse be familiar with the different medication options to treat opioid use disorder?

The Nurse's Role in Addressing the Opioid Epidemic and Substance Use Disorders

Because nurses practice in various direct-care, care-coordination, leadership, and executive roles, they are uniquely situated to help clients and their families understand the treatment options for SUDs (ANA, 2018). Nurses can screen for early identification of risk factors surrounding SUDs and assist with nonopioid pain management and alternative medication modalities, regional anesthetic interventions, surgery, psychological therapies, rehabilitative/physical therapy, and complementary and alternative medicine (CAM) (ANA, 2018). As educators and client advocates, nurses can champion sustainable harm-reduction programs linked to positive outcomes and lobby for health policies and regulations that promote equitable distribution and availability of high-quality health care services. Through awareness, education, early identification, evidence-based interventions, research, interdisciplinary collaboration, and political advocacy, nurses possess the leadership skills, knowledge, care, and capabilities to address this public health crisis.

CLIENT TEACHING GUIDELINES

What to Do for a Suspected Overdose

It may be hard to tell whether a person is high or experiencing an overdose. If you are unsure, treat it like an overdose—you could save a life.

1. Call 911 immediately.*
2. Administer naloxone, if available.
3. Try to keep the person awake and breathing.
4. Lie the person on their side to prevent choking.
5. Stay with the person until emergency assistance arrives.

*Most states have laws that may protect a person who is overdosing, or the person who called for help, from legal trouble.

(See CDC, 2023c.)

31.4 Human Trafficking

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 31.4.1 Define human trafficking.
- 31.4.2 Differentiate between labor trafficking and sex trafficking.
- 31.4.3 Examine national human trafficking statistics.
- 31.4.4 Describe tactics traffickers use to control their victims.
- 31.4.5 Discuss how to recognize a victim of human trafficking and how to safely intervene.
- 31.4.6 Explain the nurse's role in addressing human trafficking to uphold nursing's mission to society.

According to the Department of Homeland Security, **human trafficking** (HT) involves using force, fraud, or coercion to obtain labor or a commercial sex act (USDHS, 2022). The national [Blue Campaign \(*https://openstax.org/r/bluecampaign*\)](https://openstax.org/r/bluecampaign) to End Human Trafficking (2023) refers to HT as “the business of stealing freedom for profit.” Every year, millions of men, women, and children are trafficked worldwide, including in the United States. HT can happen in any community, and victims can be any age, race, gender, or nationality. Language barriers, fear of their traffickers, and/or fear of law enforcement frequently keep victims from seeking help, which often makes human trafficking a hidden crime (U.S. Department of Justice, 2019). Human trafficking has been called the fastest-growing criminal industry in the world. If one thinks of these victims in the same manner as a predator does, *as a product or commodity*, the rapid increase makes sense. For example, a person can be sold for a sex act numerous times, while a drug or weapon can only be sold once. The internet has facilitated the rapid, exponential expansion of human trafficking (United Nations Office on Drugs and Crime, 2021). Human trafficking is committed against a person’s will, and the economic sectors that profit the most include agriculture, restaurants, manufacturing, domestic work, entertainment, hospitality, and the commercial sex industry.

According to UNICEF (2017), human trafficking is the only industry in which the supply and demand are the same thing: human beings. High demand drives supply. Increasing demand from consumers for cheap goods incentivizes corporations to find cheap labor, often forcing those at the bottom of the supply chain to exploit workers. Increased demand for commercial sex—especially with young people— incentivizes commercial sex venues, pornography, and prostitution to recruit and exploit children. Traffickers target vulnerability, and systemic inequalities and disparities make certain groups more vulnerable to exploitation. Mass forced displacement (such as from war, natural disasters, religious persecution, or economic collapse), conflict, extreme poverty, lack of access to education and job opportunities, violence, and harmful social norms like child marriage are all factors that push individuals into trafficking situations. Traffickers look for people who are living in poverty, are desperate, lack legitimate job options, lack educational opportunities, and/or are looking for a way to escape violence (U.S. Department of Justice [DOJ], 2019; USDHHS, n.d.; UNICEF, 2017).

The Difference Between Labor Trafficking and Sex Trafficking

The [Trafficking Victims Protection Act \(TVPA\) of 2000](https://openstax.org/r/justicegov) (<https://openstax.org/r/justicegov>) defines the crime of **sex trafficking** as the “recruitment, harboring, transportation, provision, obtaining, patronizing, or soliciting of a person for the purpose of a commercial sex act in which a commercial sex act is induced by force, fraud, or coercion, or in which the person induced to perform such act has not attained 18 years of age” (22 U.S.C. § 7102(11)(A)). In another major criminal industry, **labor trafficking**, individuals are compelled against their will to provide work or service through the use of force, fraud, or coercion. Traffickers frequently target vulnerable populations, such as children, individuals without lawful immigration status, those with debts, and those who are isolated, impoverished, or disabled of any race, religious affiliation, gender identity, or socioeconomic background. Victims of labor trafficking are rarely able to seek help. Victims may be hindered by language barriers or physically unable to seek help if their employer restricts and monitors their movements. U.S. citizens, foreign nationals, and women, men, and children of any race, religious affiliation, gender identity, or socioeconomic background can be victims of forced labor (HHS, n.d.; DOJ, 2022). Certain risk factors may make some individuals more vulnerable to forced labor than others, including (Department of Homeland Security, 2022b):

- Unstable immigration status
- Language barriers
- Poverty and lack of basic needs like food, shelter, and safety
- The psychological effects of a recent or past trauma
- Lack of social support systems such as friends, family, and community
- Physical or developmental disabilities

Common types of labor trafficking include people forced to work as domestic servants, farmworkers coerced through violence to harvest crops, or factory workers held in inhumane conditions with little to no pay. In the United States, domestic work is the most common form of labor trafficking (International Labour Organization [ILO], 2023; Department of Homeland Security, 2022b).

Examining National Human Trafficking Statistics

Based on the criminal nature of human trafficking and its subsequent underreporting, it is challenging to establish reliable statistics on its true prevalence in the United States. The hidden nature of the crime reduces the quality and quantity of available data and complicates efforts to identify individual victims. For these reasons, data and statistics may not reflect the full nature or scope of the problem.

The International Labour Organization (ILO) and the Walk Free Foundation, in partnership with the International Organization for Migration (IOM), released [Global Estimates of Modern Slavery](https://openstax.org/r/ilorgwcmsp) (<https://openstax.org/r/ilorgwcmsp>) in September 2022. This report estimates that, at any given time in 2021, approximately 27.6 million people were in forced labor. Of these, 17.3 million were exploited in the private sector, 6.3 million in forced commercial sexual exploitation, and 3.9 million in forced labor imposed by the state. The definition of forced labor used in this report is based on ILO Forced Labour Convention, 1930 (No. 29), which states in Article 2.1 that forced labor is “all work or service which is exacted from any person under the menace of any penalty and for which the said person has not offered himself voluntarily” (ILO, 2022).

Tactics Used by Sex Traffickers

Sex traffickers recruit victims in the United States in shopping malls, junior high and high schools, foster homes, group homes, courthouses, restaurants and bars, bus stations, concerts, parks, libraries, and social networking websites ([Figure 31.5](#)). Caregivers should be aware that one of the most common ways that traffickers access children is through the use of social media sites like Facebook and Instagram (U.S. Department of State, 2023).

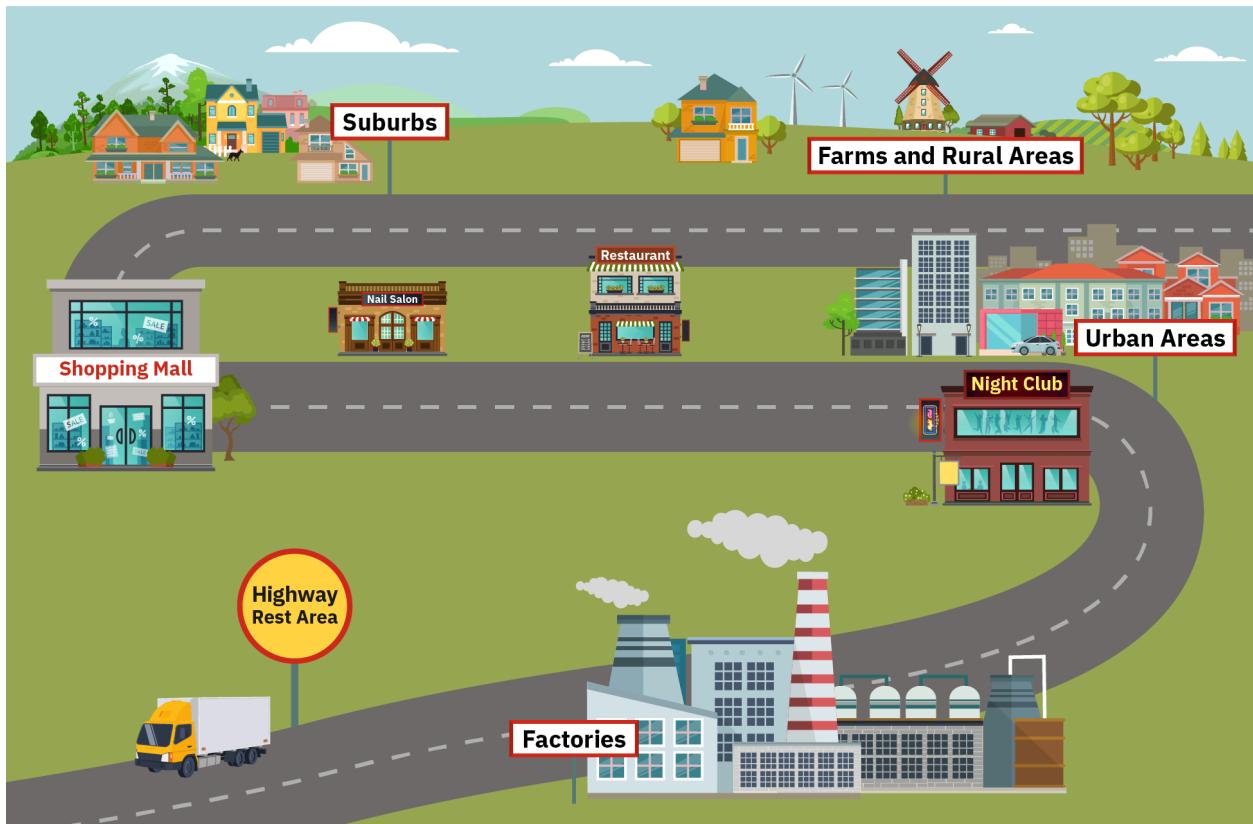

FIGURE 31.5 Human trafficking occurs in all areas of a community, often in plain sight. (See Blue Campaign, 2023; attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

Traffickers are experts at finding moments when people are vulnerable, working the angles, manipulating reality, and leveraging fears. The methodical, intentional process of identifying and manipulating victims is called **grooming**. It is the most common way that people—adults and children—wind up in sex trafficking situations. Sex trafficking rarely begins with a violent abduction. While every situation is different, the overall grooming process usually involves the following steps:

- Targeting the victim
- Gaining their trust
- Meeting their needs
- Isolating them from social supports
- Exploiting their weaknesses
- Maintaining control of their actions

Using the grooming process, a trafficker gains full control over their victim and manipulates them into cooperating in their own exploitation. While spotting the grooming process from outside the relationship can be difficult, knowing and understanding the three types of traffickers/pimps—Romeo, gorilla, and CEO—could help prevent future victimization (ARK2Freedom, 2022; Switch 2023).

Romeo pimps capitalize on the victim's need to feel loved, be seen, and feel desired. They use the “boyfriend” technique, romancing the victim and promising to fill their voids and vulnerabilities, encouraging the victim's loyalty. Although they may use physical violence, Romeo pimps maintain control of their victim through psychological manipulation. They may cut the victim off by moving them away from family and friends and taking away their phone and other means of communication. The Romeo pimp is the most common tactic used when manipulating a potential victim into human trafficking. This method is frequently employed to lure minors, particularly runaway children, children from foster homes, or children who feel unwanted, abandoned, or rejected by their caregivers, such as LGBTQ+ youth.

Gorilla pimps fit the stereotypical image depicted in Hollywood movies. These pimps flaunt their wealth and control their victims through physical violence and force. Gorilla pimps often use money and drugs to lure their victims and

extort those already in unstable situations. This is the most brutal type of pimp and the opposite of a Romeo pimp in that it involves no staged love or affection. Instead, gorilla pimps use routine violence to recruit and trap people in sex trafficking, making it clear that a victim's job is to engage in sex for payment and failure to do so will result in severe consequences, usually involving physical and sexual abuse.

CEO pimps conduct their operations as they would a legitimate business. They often own a legal business to cover up their crimes. CEO pimps often look like average business executives. They are entrepreneurs of the sex trade and may keep books or engage in other legal and illegal endeavors for profit.

HUMAN TRAFFICKING, EXPLAINED

[Access multimedia content \(<https://openstax.org/books/population-health/pages/31-4-human-trafficking>\)](https://openstax.org/books/population-health/pages/31-4-human-trafficking)

This video provides an overview of the pimps of human sex trafficking and the different tactics they use to groom potential victims.

Watch the video, and then respond to the following questions.

1. What are two examples of vulnerabilities that pimps might identify and use to lure in potential victims?
2. What are the three types of pimps? How are they different?
3. How might a pimp use social media to traffic victims?

The Nurse's Role in Addressing Human Sex Trafficking

Health care workers, including nurses, must be trained to recognize sexual slavery. Human trafficking will continue as long as there is demand for its victims. Health care encounters with nurses may be one of the only channels through which a victim is identified—for example, in the emergency department (ED), health care clinic, or primary care setting. Proper nurse education can lead to potential identification and intervention. Victims who are in a clinic or ED may rely on a nurse to ask the right questions at the right time. A nurse may be the only other human contact they experience in months or years, depending on their situation.

Unless they watch for signs and clues, a nurse may not recognize a victim. This is especially true if the abuser acts protective and caring or does not allow adequate time or conversation with the victim. Nurses must be sensitive and methodical in approaching a suspected victim. Knowing appropriate questions to ask the victim and abuser or using a screening tool can open dialogue and uncover possible victimization.

INDICATORS OF HUMAN TRAFFICKING

Recognizing key indicators of human trafficking is the first step in identifying victims and can help save a life. Common indicators to help recognize human trafficking are listed below. You can also download or order the Blue Campaign [indicator card \(<https://openstax.org/r/dhsgovb>\)](https://openstax.org/r/dhsgovb) in a wide variety of languages. The Blue Campaign indicator is a small plastic card that lists common signs of trafficking and how to report the crime.

- Does the person appear disconnected from family, friends, community organizations, or houses of worship?
- Has a child stopped attending school?
- Has the person had a sudden or dramatic change in behavior?
- Is a juvenile engaged in commercial sex acts?
- Is the person disoriented or confused or showing signs of mental or physical abuse?
- Does the person have bruises in various stages of healing?
- Is the person fearful, timid, or submissive?
- Does the person show signs of having been denied food, water, sleep, or medical care?
- Is the person often in the company of someone to whom they defer? Or someone who seems to be in control of the situation, e.g., where they go or to whom they talk?
- Does the person appear to be coached on what to say?
- Is the person living in unsuitable conditions?

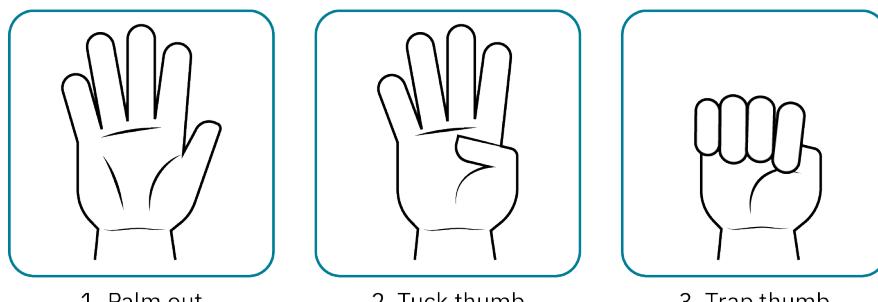

- Does the person lack personal possessions and appear not to have a stable living situation?
- Does the person have freedom of movement? Can the person freely leave where they live? Are there unreasonable security measures?

Not all indicators listed above are present in every human trafficking situation, and the presence or absence of any of the indicators is not necessarily proof of human trafficking.

Pay attention for the now commonly used nonverbal emergency SOS hand signal. The Canadian Women's Foundation introduced the signal in April 2020 in response to increasing rates of domestic violence during the COVID-19 lockdown. The "Signal for Help" is designed to be displayed inconspicuously and is made by facing the palm outward, folding the thumb across the palm, and then closing the fingers over the thumb ([Figure 31.6](#)).

(See Department of Homeland Security, 2022a.)

HAND SOS

1. Palm out

2. Tuck thumb

3. Trap thumb

FIGURE 31.6 The Canadian Women's Foundation designed this emergency SOS Hand Signal as a response to increasing rates of domestic violence during the COVID-19 lockdown. (See Canadian Women's Foundation, n.d.; attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

THE ROOTS OF HEALTH INEQUITIES

A Public Health Perspective on Human Trafficking

The article "Multi-level Prevention of Human Trafficking: The Role of Health Care Professionals" provides an overview of key public health strategies aimed at addressing human trafficking. Primary prevention can be achieved by identifying social determinants through the critique of the economic, education, social welfare, criminal justice, and health care systems that continue to perpetuate the traumatization of individuals.

(See Greenbaum et al., 2018.)

HEALTHY PEOPLE 2030

Violence Prevention

One goal of Healthy People 2030 is [Prevent violence and related injuries and deaths](https://openstax.org/r/healtheypopleobjective) (<https://openstax.org/r/healtheypopleobjective>). Recognizing that human trafficking is often linked to physical assaults and sexual violence, Healthy People 2030 provides evidence-based resources and prevention strategies at the school, family, and community levels.

31.5 Refugees

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 31.5.1 Differentiate between a refugee and an asylum seeker.
- 31.5.2 Describe common health conditions affecting population health in refugee camps.
- 31.5.3 Explain the unique health challenges for refugees and asylum seekers.
- 31.5.4 Discuss why promoting the health of refugees is a matter of social justice.
- 31.5.5 Explain the nurse's role in addressing the refugee crisis to uphold nursing's mission to society.

Refugee and *asylum seeker* both refer to people who have left their homes, and they are often used interchangeably. Although the two groups flee their homes for similar reasons, they use different means to reach the United States. The different designations have separate legal statuses with consequent legal obligations and protections.

According to the [1951 Convention Relating to the Status of Refugees \(https://openstax.org/r/instrumentsmea\)](https://openstax.org/r/instrumentsmea), a **refugee** is “a person who, as a result of a well-founded fear of being persecuted for reasons of race, religion, nationality, membership of a particular social group, or political opinion” has crossed an international border and cannot return to their home (United Nations [UN], 2023a). Recently, more people have been forced to flee their homes than at any time since World War II, with about 110 million individuals displaced worldwide (International Rescue Committee, 2023; UN Higher Commission for Refugees [UNHCR], 2023b). Child refugees face numerous risks and dangers, including disease, malnutrition, violence, labor exploitation, and trafficking.

The UN Higher Commission for Refugees (UNHCR, 2023b) defines **forced displacement** “as a result of persecution, conflict, generalized violence or human rights violations” and a **stateless** person (UNHCR, 2023a) as someone who is “not considered as a national by any state under the operation of its law.” Some stateless people are also refugees. However, not all refugees are stateless, and many people who are stateless have never crossed an international border (U.S. Department of State, n.d.).

Asylum is a form of legal protection that prevents individuals from being deported to a country where they might experience harm and may legally remain. An **asylum seeker** is someone who has fled persecution and serious human rights violations in their home country but who has not yet been legally recognized as a refugee or received a decision on their asylum claim. Seeking asylum is a human right (Amnesty International, 2023), and individuals can apply for asylum either at another country’s border or from within the country where they would like to resettle. An individual cannot seek asylum in the United States from their native country—individuals may file for asylum only if they are in the United States or at a port of entry.

International law protects refugees. Under the 1951 Refugee Convention (and its 1967 Protocol), refugees cannot be returned to their home country after fleeing and seeking asylum in another country. Before leaving their geographical home of legal affiliation (i.e., where they would hold a passport of issuance), they must apply for refugee status through the United Nations High Commission for Refugees (UNHCR; 2023c) and then be selected for resettlement. Refugees do not get to choose the country where they will be resettled; they are more likely to be resettled in the United States if they already have family members living there. Refugees are thoroughly vetted, with multiple background checks and medical screenings. Once they have passed all checks and are approved, they are flown to the United States, where a local resettlement agency helps them during a transition period when they first arrive. [Table 31.3](#) presents definitions of the terms used to describe these populations.

Term	Definition
Asylum seeker	Someone whose request for sanctuary has yet to be processed. Every year, around one million people seek asylum.
Immigrant	A person living in a country other than that of their birth.

TABLE 31.3 Comparison of Terms to Describe Individuals Who Leave Their Home Countries

Term	Definition
Migrant	An umbrella term, not defined under international law, reflecting the common lay understanding of a person who moves away from their place of usual residence, whether within a country or across an international border, temporarily or permanently.
Refugee	Someone forced to flee their home because of war, violence, or persecution, often without warning. They cannot return home unless and until conditions there are safe for them again.

TABLE 31.3 Comparison of Terms to Describe Individuals Who Leave Their Home Countries

Common Conditions Affecting Health in Refugee Camps

Many who flee their homes or are forcibly displaced find themselves in a refugee camp, a temporary settlement built to accommodate displaced people who have fled their home country; however, camps are also made for internally displaced people ([Figure 31.7](#)). Usually, refugees seek asylum after escaping war in their home countries, but some camps also house environmental and economic migrants. Refugee camps with over a hundred thousand people are common; however, the average-sized camp houses approximately 11,000 people (Daynes, 2016; USA for UNHCR, 2023). The Kutupalong-Balukhali refugee settlement in Bangladesh includes over 800,000 refugees, over half of them children, making it one of the largest such settlements in the world (USA for UNHCR, 2023).

Refugee camps are usually built and run by a government, the UN, international organizations (such as the International Committee of the Red Cross), or nongovernmental organizations (NGOs). Refugee camps generally develop impromptu to provide people with protection and assistance. Shelters include rental units, prefabricated containers, tents, plastic sheeting, and other materials based on available supplies (UNHCR, n.d.-a; n.d.-b). Space in the camps is often tight, so shelters are often crowded together. It is common for several families to live together in the same dwelling.

The quality and quantity of sanitation facilities vary among camps. While some may have communal toilet facilities and running water, others may rely on pit latrines dug by residents. Few or no sanitary facilities may be accessible for people with disabilities (CARE Staff, 2020). Poor drainage, seasonal flooding, and inadequate cleaning increase infectious disease risk. According to the UNHCR Emergency Handbook, each person should be allocated 15 liters (about 4 gallons) of water per day in an emergency situation and 20 liters (about 5.25 gallons) in a nonemergency situation for personal and domestic needs (UNHCR, n.d.-a). However, the UNHCR estimates that over half of existing camps lack the water to meet these guidelines (The Borgen Project, 2020).

FIGURE 31.7 A refugee camp is a temporary settlement built to accommodate displaced people who have fled their home country or an area within their home country. (credit: “Emergency shelter tents and waste drainage ditch, inside the IDP camp at Menik Farm, near Vavuniya, Sri Lanka. 16 June 2009” by Russell Watkins/Department for International Development/Flickr, CC BY 2.0)

Unique Health Challenges

Refugees and asylum seekers can have complex health needs. Overcrowding, poor water and sanitation conditions, lack of vaccinations, delayed diagnosis, and reduced access to treatment can increase the occurrence, severity, and case fatality of infectious diseases (Altare et al., 2019). For example, viral hepatitis A, B, and C (CDC, 2020; Taha et al., 2023), measles, diarrheal diseases, acute respiratory infection, and malaria account for 60 to 80 percent of all reported causes of death among refugees (Johns Hopkins Bloomberg School of Public Health, 2018). Cholera outbreaks may also occur because camps have ideal conditions for its spread: inadequate water treatment, poor sanitation, and inadequate hygiene (Bonyan Organization, 2023). For children, key priority infectious diseases among refugee populations include tuberculosis, hepatitis B, and vaccine-preventable and parasitic diseases (Shetty, 2019). COVID-19 took a devastating toll on refugee resettlement. In addition to exposure to infectious diseases, individuals may have preexisting or poorly controlled chronic conditions, such as diabetes, cardiovascular diseases, respiratory conditions, and cancer. Many have psychiatric illnesses like post-traumatic stress disorder and depression (Abbas, et al., 2018) as well as maternity care needs.

Holistic and person-centered care is essential to support resilience and help refugees and asylum seekers adapt to life in the United States. When a nurse treats a refugee or asylum seeker, they should screen for infectious diseases that are common in countries where these clients have spent time. The nurse may also identify symptoms of communicable diseases when clients present with other routine issues. In some countries, screening for infectious diseases, such as HIV and hepatitis, may not be easily accessible, or people may not seek testing due to fear of stigma or lack of treatment options. Nurses should discuss the possibility of receiving a positive result in advance with clients from countries with high rates of certain diseases. They should find out what vaccinations refugees and asylum seekers have received and offer missing vaccinations to children and adults based on the latest national immunization schedule. As with all clients, nurses should inform refugees and asylum seekers about any testing, treatment, or vaccinations offered to them. This may require extra care in explaining their rights to confidentiality. For example, a nurse may need to reassure a client that a positive test result will not negatively affect asylum applications. Some clients may need additional health education in an appropriate language to understand their options, which may require an interpreter, or it may be appropriate to give the client written information in their language to take away, depending on their literacy level. Specialist client support organizations may also be able to assist with educating and informing clients about their rights and health care options.

Women who have experienced female genital mutilation (FGM), and their female children if they are considered to be at risk of FGM, may require additional support. FGM can cause ongoing physical and mental health issues, including complications during pregnancy and childbirth, which should be planned for. It may also deter women from being screened for cervical cancer (United Nations Population Fund, 2022).

Although refugees and asylums seekers do not display mental health problems frequently (Gov.UK, 2017; Hynie, 2018), they can be at increased risk, particularly if they have experienced violence and trauma, including exploitation, torture, or sexual and gender-based violence. Issues can range from low to moderate levels of anxiety and depression to more severe mental disorders. People from different cultural backgrounds can have different conceptions and experiences of mental illness. For example, clients may complain about nonspecific pain, frequent headaches, and stomachaches rather than emotional distress. In such cases, the nurse should sensitively investigate their history, as well as current circumstances, to establish whether such complaints may be an expression of mental health or other social issues. This approach can help minimize unnecessary referrals for investigations and medication prescribing. It can be helpful to consider dialect, culture, gender, and sexual orientation when selecting a language interpreter. It may also be beneficial to link clients with support organizations with expertise in supporting refugees and asylum seekers.

Providing TIC for people who have experienced violence or persecution—particularly torture—can be challenging. Refugees and asylum seekers are also at risk of exploitation, trafficking, and modern slavery. According to the British Medical Association, “recent estimates suggest that on average 44 percent of asylum seekers have experienced torture, although this can vary significantly by country” (BMA, 2023). This can often involve experiences of mental, physical, and sexual violence. They may be unable to discuss their health problems openly or fear examination. They may also have difficulty trusting people in positions of authority, including doctors. Experiences of torture and other violence can cause deep-rooted feelings of shame, humiliation, and guilt, and many clients may be reluctant to disclose to a relative stranger. Nurses should respond compassionately and sensitively

and be aware that building a relationship of trust and support to facilitate disclosure can take some time. If clients are willing to talk about what happened to them, the situation described can be disturbing for the nurse and the client. This is a time when the nurse can maximize their use of the TIC steps presented earlier in the chapter.

Promoting Social Justice

As a term, “social justice” must consider four principles: access, human rights, participation, and equity (Soken-Huberty, 2023; WHO, 2022b):

- Access: Countries that have signed the 1951 Convention are obliged to protect refugees on their territory and treat them according to internationally recognized standards. Subsequently, protecting refugees is the primary responsibility of states.
- Human rights: Refugees have human rights, the inalienable rights to which a person is entitled merely for being human. Refugees must respect the laws and regulations of the United States. Refugees should receive at least the same rights and basic help as any other foreigner who is a legal resident, including freedom of thought and movement and freedom from torture and degrading treatment.
- Participation: Refugees bring productivity to host countries, where they are integrated across communities. They enrich those communities, helping to nurture understanding and appreciation for social diversity.
- Equity: To fulfill physical protection minimum standards, refugees need to be provided with adequate food, sanitation, hygienic products, and any nonfood items that are needed in a specific context or emergency.

Nurses have a professional and ethical responsibility to advocate for social justice (ANA, 2015). Refugees are one of the most vulnerable populations in the United States, and they interact with nurses at all levels of the health care system. As nurses become increasingly educated and skilled in cultural competence, they can make the transition to immigration less chaotic and subsequently enhance well-being and promote healthy lifestyles.

The Nurse's Role in Addressing the Refugee Crisis

It is a human right to seek asylum from persecution or safety from war or disaster, and in doing so, people should not be subjected to cruel, inhumane, or degrading treatment or circumstances. Nurses need to foster a healthy and adaptive environment in which people can thrive despite personal, political, emotional, physical, or social adversity. Nursing care is indispensable for the easing of human distress and for the promotion of comfort and coping. Nurses are essential in advocating for policies that will enhance immigrants’ access to health care and mental health services and address barriers irrespective of their status as migrants, refugees, or asylum seekers (Desmyth et al., 2021). At the macro level, based on the [New York Declaration for Refugees and Migrants](https://openstax.org/r/ohchrorgenm) (<https://openstax.org/r/ohchrorgenm>), signed by the United Nations (2016b), it is the obligation of a state not to hinder refugees seeking to enter it, nor to return them forcibly to the country they have fled (the principle of nonrefoulement), which is grounded in the natural duty not to harm the innocent.

At the more micro level, nurses need to understand the legal and systemic difference between an individual seeking asylum for fear of persecution and someone who has been granted refugee status and offered humanitarian protection. While health care entitlements between these groups remain inconsistent, the principle of access to equitable health care as a fundamental human right must be upheld (Desmyth et al., 2021). The codes of ethics of the ANA and the International Council of Nurses (ICN) mandate that all nurses work to advocate for social justice (ANA, 2015; ICN, 2012). Thus, nurses are expected to apply these ethical principles in practice.

Nursing care and advocacy must be in the context of justice and equity, which requires ongoing awareness of and involvement with the resources in communities. Nurses can collaborate with organizations to acknowledge and dismantle racism and sexism and foster human rights. Instead of giving a “voice” to migrants and refugees, nurses provide opportunities for them to tell their own stories as well as to identify their own health needs and the best ways to address those needs (Commodore-Mensah et al., 2021).

HEALTHY PEOPLE 2030

Social Cohesion

A focal point for the *Healthy People 2030* initiative is [Social Cohesion](https://openstax.org/r/healthypeopleab) (<https://openstax.org/r/healthypeopleab>). Social cohesion has significant ramifications for health. For example, one study examined the link between four

measures of social capital (perceived fairness, perceived helpfulness, group membership, and trust), income inequality, and mortality. The authors found that all four measures of social capital were associated with mortality. They also found that the relationship between income inequality and mortality may be partially explained by reductions in social capital as income inequality increases. Collective efficacy, an aspect of social capital and social cohesion, is grounded on mutual trust and describes a community's ability to create change and exercise informal social control (i.e., influence behavior through social norms). Collective efficacy is associated with better self-rated health, lower rates of neighborhood violence, and better access to health-enhancing resources like medical care, healthy food options, and places to exercise. Social institutions like religion and the family are common sources of social capital and social control as well as social networks and social support.

Chapter Summary

31.1 Trauma-Informed Care

TIC is a therapeutic approach that centers on the understanding that trauma can have long-lasting emotional, neurological, psychological, social, and biological effects. It acknowledges that ACEs can significantly impact present and future health. A TIC-informed approach uses six guiding principles to ensure every client interaction is mindful and places the client's well-being first; the client is not harmed further or retraumatized by working on their past. A trauma-informed approach requires the nurse's constant attention, caring awareness, and sensitivity.

31.2 The Mental Health Crisis

The U.S. health care system is overburdened with the rise in mental health issues. Mental health services are insufficient to address clients' needs. Stigma surrounding mental illness can be a barrier to accessing mental health services. As trusted advocates, nurses are uniquely positioned to recognize mental health concerns, provide compassion to clients, and help clients access treatment. Nurses must establish a therapeutic nurse-client relationship. Understanding who the client is, what is occurring in their life, what resources are available to them, and their individual beliefs, supports, and demeanor can help a nurse determine if a client is at risk for ineffective coping and possible progression to crisis.

31.3 The Opioid Epidemic and Substance Use Disorders

Deaths from SUDs, particularly with opioid overdoses, have increased dramatically in recent years. The opioid epidemic has many causes including the notable increase in opioid prescriptions, rise in heroin use, and availability of illicitly manufactured fentanyl. This public health crisis spawns various socioeconomic and health consequences affecting all populations. Public health initiatives must address social determinants of health that cause systematic inequalities, barriers to health care access, and the promotion of stigma. A unified approach is needed to address associated mental disorders and SUDs. Nurses are poised to make a distinct difference in effecting change in vulnerable

Key Terms

asylum a form of legal protection that prevents individuals from being deported to a country where they might experience harm

asylum seeker a person who has left their country and is seeking protection from persecution and

individuals, communities, and populations impacted by the opioid epidemic. Evidence-based strategies must include early identification, evidence-based interventions, harm-reduction programs, recovery services, and advocacy for policies to combat this public health epidemic.

31.4 Human Trafficking

Every year, millions of men, women, and children are trafficked worldwide. This often-hidden crime can happen in any community and to individuals of any age, race, gender, or nationality. Human trafficking is committed against a person's will, and the economic sectors that profit the most include agriculture, restaurants, manufacturing, domestic work, entertainment, hospitality, and the commercial sex industry. Language barriers, fear of their traffickers, and/or fear of law enforcement frequently keep victims from seeking help. Health care encounters with nurses may be one of the only channels through which a victim is identified. The nurse's ability to identify a victim and knowledge of the available resources to assist a victim can be lifesaving for some victims.

31.5 Refugees

Refugees and asylum seekers have left their homes, fleeing persecution due to race, national origin, religion, political opinion, or membership in a particular social group. This population faces many risks and dangers, including disease, malnutrition, violence, labor exploitation, and trafficking. Poor living conditions and inadequate hygiene make refugees vulnerable to many health conditions. Overcrowding, poor water and sanitation conditions, lack of vaccinations, delayed diagnosis, and reduced access to treatment can lead to increased occurrence, severity, and case fatality of infectious diseases. Nurses treating this population should offer screening for infectious diseases and determine vaccination status. Some clients may need additional health education in an appropriate language to understand their options. Specialist client support organizations may also be able to assist.

serious human rights violations in another country but who has not yet been legally recognized as a refugee and is waiting to receive a decision on their asylum claim

CEO pimps pimps who promise victims lucrative

careers and legitimate income	morphine, and many others
discrimination treating someone unfairly based on characteristics that ought to be irrelevant	prejudice a preconceived negative opinion of someone that is not based in facts; may predispose people to dislike and/or disrespect people with a specific diagnosis, such as schizophrenia or depression
forcibly displaced forced to leave one's home because of conflict caused by humans (war, religious or political persecution, etc.) or by natural disasters	public stigma involves the negative or discriminatory attitudes that others have about mental illness
gorilla pimp a pimp who controls their victims almost entirely through physical violence and force	refugee a person outside their country of origin for reasons of feared persecution, conflict, generalized violence, or other circumstances that have seriously disturbed public order and, as a result, require international protection
grooming a process in which a trafficker works to gain the trust of their identified victim by posing as a good listener who cares deeply as they learn more about what they can do to insinuate themselves in the victim's life; once a trafficker has gained the trust of their victim and better understands the victim's needs, the trafficker offers a solution to meet those needs	Romeo pimps human traffickers who usually operate by trying to make young people fall in love with them or who manipulate young people in other ways; once they have victims under their influence, they exploit them
human trafficking (HT) also known as trafficking in persons, a crime that involves compelling or coercing a person to provide labor or services or to engage in commercial sex acts	self-stigma refers to the negative attitudes, including internalized shame, that people with mental illness have about their own condition
institutional stigma government and private policies that intentionally or unintentionally limit opportunities for people with mental illness	sex trafficking the recruitment, harboring, transportation, provision, or obtaining of a person for the purposes of a commercial sex act in which the commercial sex act is induced by force, fraud, or coercion or in which the person induced is under age 18
labor trafficking a form of slavery in which individuals perform labor or services through the use of force, fraud, or coercion; includes situations of debt bondage, forced labor, and involuntary child labor	stateless a person who does not enjoy citizenship—the legal bond between a government and an individual—in any country; some stateless people are also refugees, but not all refugees are stateless, and many people who are stateless have never crossed an international border
mental health crisis describes the current state of the U.S. health care system as it continues to be overburdened by the rise in mental health issues, as available mental health services are insufficient to meet clients' needs	substance use disorders (SUDs) chronic, relapsing, potentially deadly conditions that occur when the recurrent problematic use of substances leads to significant impairments of an individual's health and function to meet major vocational, academic, social, or personal responsibilities
opioid naive the connotation that an individual is not chronically receiving opioids daily	trauma-informed care (TIC) a therapeutic approach that acknowledges trauma's long-lasting emotional, neurological, psychological, social, and biological effects on a person's present and future health
opioids natural, synthetic, or semisynthetic chemicals that interact with opioid receptors on nerve cells in the body and brain to reduce the intensity of pain; this drug class includes the illegal drug heroin, synthetic opioids such as fentanyl, and pain medications available legally by prescription, such as oxycodone, hydrocodone, codeine,	

Review Questions

- The community health nurse is performing an admission assessment on a client with a substance use disorder. Which of the following questions is most appropriate for the nurse to use when interviewing the client about their substance use history?
 - Why have you waited until now to seek treatment?
 - What type of substances do you use and how often?
 - Do you think you can follow through with the treatment plan?
 - Why did you let yourself get addicted?

2. A nurse is speaking to a community group about the opioid epidemic. Which of the following statements about the epidemic is accurate?
 - a. The epidemic started with increased availability of prescribed opioids.
 - b. The epidemic started with increased availability of low-cost heroin from Mexico.
 - c. Increased prescribing of opioids prompted the second wave of the epidemic.
 - d. Illegally manufactured fentanyl generated the second wave of the epidemic.
3. The community health nurse is working with a group of sexual assault survivors. During a group discussion, the nurse offers each client 10 minutes to share their feelings with the group. This action by the nurse is consistent with which of the CDC's principles of trauma-informed care?
 - a. Cultural, historical, and gender issues
 - b. Empowerment and choice
 - c. Collaboration and mutuality
 - d. Trustworthiness and transparency
4. The nurse is working with a group of clients that includes assault survivors. Which of the following actions by the nurse best reflects trauma-informed care?
 - a. The nurse places a hand on the client's shoulder to show support.
 - b. The nurse provides instruction using medical terminology relevant to their experiences.
 - c. The nurse introduces themselves and explains what they will be doing during the session.
 - d. The nurse remains standing and walks around the (seated) clients during the session.
5. The community health nurse is working with a group of teenagers as part of an after-school health promotion program. When working with this age group, which of the following risk factors should the nurse be aware of?
 - a. Teenagers are more likely to be uninsured.
 - b. Teenagers are less likely to be depressed.
 - c. The risk of mental illness is the highest among this age group.
 - d. The risk of suicidal ideations is the highest among this age group.
6. The nurse is working with a family that has a member who was just diagnosed with a mental illness. Another family member tells the nurse that he believes the client is "just being annoying and trying to get attention." Which of the following best describes the family member's statement?
 - a. It reflects the public stigma around mental illness.
 - b. It reflects the institutional stigma around mental illness.
 - c. Since a close family member made the comment, it is a form of self-stigma.
 - d. It is a discriminatory statement.
7. A community health nurse is aware that which members of the community are at highest risk of becoming victims of labor trafficking?
 - a. Environmental services workers
 - b. Hotel workers
 - c. Food service workers
 - d. Farmworkers
8. When nurses interact with clients with SUDs, which of the following terms/language would be best to avoid because it may promote stigmatization of SUDs?
 - a. Maintaining recovery; substance-free
 - b. Clean sample; dirty drug test
 - c. Person with substance use disorder
 - d. Negative test; positive test
9. Which of the following would alert the nurse that a client may be a victim of human trafficking?
 - a. The client can show their driver's license.

- b. The client gives a home address.
 - c. The adult who brought the client does not want to leave them alone with the health care staff.
 - d. The client states she is tired and hungry.
- 10.** A nurse working in a refugee camp should consider which of the following when working with refugees in the camp?
- a. Refugees do not receive protection under international law.
 - b. Refugees can return to their home country after fleeing and seeking asylum in another country.
 - c. Their health is influenced by both camp conditions and their country of origin.
 - d. Most refugee camps are built according to public health standards.

CHAPTER 32

Principles of Disaster Management

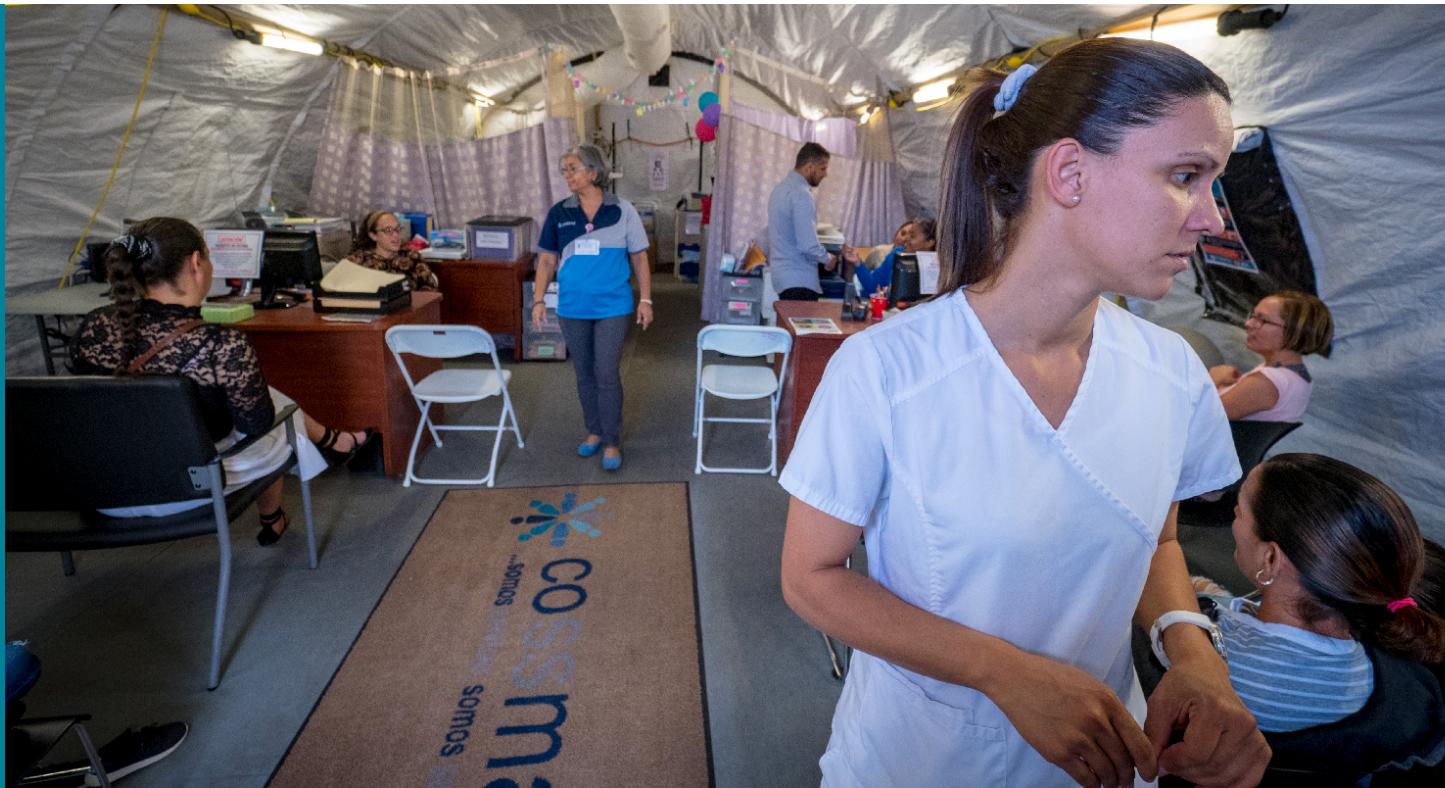

FIGURE 32.1 Health care providers treat clients in a temporary shelter and two trailers following the destruction of their health care facility by Hurricane Maria. (credit: modification of work by Preston Keres/USDA/Flickr, Public Domain)

CHAPTER OUTLINE

- 32.1 Types of Disasters
- 32.2 Biological Terrorism
- 32.3 Mass Violence
- 32.4 The Disaster Management Cycle
- 32.5 The Nurse's Role in Emergency Preparedness and Disaster Response

INTRODUCTION Community hospitals and health care centers near coastlines stay on alert for hurricanes and storm surges during the active hurricane season. One year, hospital administrators along the Gulf Coast are particularly concerned, as experts have forecasted nine hurricanes, five of which are expected to be major storms. The hospital has several outlying facilities, and the administrators have invited Beverly, a community health nurse, to their annual review and update of the disaster plan. The community has experienced rapid growth in retirees and culturally diverse groups of residents, and they are relying on Beverly's expertise in the community to help predict the needs of people in the event of a catastrophic storm. Beverly has conducted a community assessment and is presenting the current state of the population and the potential risk factors that could impact them if the area sustained a direct hit from a hurricane.

Nurses like Beverly play a valuable role in disaster preparedness in the community. They are familiar with the community's demographics and available resources, making them an essential part of the preparedness team. This chapter will discuss the types of disasters that require disaster response, the disaster response cycle, and the nurse's role in disaster response.

32.1 Types of Disasters

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 32.1.1 Describe different types of disasters, differentiating between natural and human made.
- 32.1.2 Discuss health and safety hazards of disasters and public health emergencies and how they affect people and communities.
- 32.1.3 Assess conditions to identify disasters or public health emergency risks, including a community's vulnerability to a disaster.

The word “disaster” can elicit feelings of anxiety, dread, and fear. A **disaster** is any occurrence that causes destruction, human injury, or loss that overwhelms the community’s available resources. The number and impact of disasters rise each year. In 2022, 387 disaster events occurred worldwide. These events affected 185 million people, caused 30,704 deaths, and resulted in \$223.8 billion in economic damage (Centre for Research on the Epidemiology of Disasters [CRED], 2023). As disasters become more common globally, people are more sensitive than ever to discussions of disasters. Advanced communication methods can instantaneously disseminate news to social media outlets, inundating individuals with a constant flow of information and graphic details of the aftermath of disasters. Seemingly “small” incidents may quickly develop into a disaster if resources such as supplies, equipment, personnel, or any other reserves necessary to provide care and recovery during a serious event are unavailable or are depleted quickly. For example, if only one emergency responder arrives without supplies or equipment on the scene of a single car accident with four victims, this could be viewed as a disaster until appropriate resources are dispatched and arrive to assist.

Public health or community health nurses play a key role in reducing a disaster’s impact. They help assess a community’s disaster risk, coordinate and participate in preparedness activities, and aid in disaster response/recovery efforts to maximize available resources and minimize loss. A solid disaster prevention, preparedness, response, and recovery plan is key to the community’s ability to emerge stronger and healthier if a disaster occurs.

Disasters are categorized into two main types: natural and human made. Each type has the potential for human, material, economic, or environmental losses with short- or long-term effects on the community.

Natural Disasters

Natural disasters are those that arise from forces of nature, such as weather events (hurricanes, tornadoes, snowstorms, heat waves, lightning, thunderstorms, and droughts), geological events (mudslides, floods, landslides, and avalanches), underground events (tsunamis, earthquakes, and volcanic eruptions), or epidemiological events (communicable disease outbreaks or swarms). Some natural disasters occur gradually or can be predicted, allowing communities to prepare for the event. However, many natural disasters occur suddenly and are unpredictable, causing significant public health risks to communities ([Figure 32.2](#)). Destruction and devastation from natural disasters have risen astronomically throughout the world over the past 40 to 50 years (U.N., 2021; White House, 2022). Floods, droughts, severe storms, hurricanes, and heat waves have caused 80 to 90 percent of all documented natural disasters since 2013 (World Health Organization [WHO], 2023b). The WHO (2023b) has attributed the number of weather-related natural disasters in recent years to increased weather extremes resulting from climate change. See [Environmental Health](#) for more information on the effects of climate change.

FIGURE 32.2 On March 11, 2011, a magnitude 9.1 earthquake occurred off the eastern coast of Japan, near the Tōhoku region. The quake was the fourth largest in recorded history and set off a massive tsunami, with some waves estimated to be as much as 133 feet high. The tsunami in turn caused the Fukushima Daiichi nuclear disaster, which involved the meltdown of three of the power plant's reactors, the release of radioactive water, and the evacuation of hundreds of thousands of residents in what became the exclusion zone. This photo of the tsunami-damaged interior of a seaside recreation facility within the exclusion zone was taken 10 years later. The scope of the disaster complicated emergency response operations and meant that staff, volunteers, and resources were overburdened and had difficulty keeping up with mounting needs. Lack of detailed planning for vulnerable populations, such as older adult and hospitalized clients, resulted in deaths that may have been avoidable. (Committee on Lessons Learned from the Fukushima Nuclear Accident for Improving Safety and Security of U.S. Nuclear Plants, 2014) (credit: "Marine House Futaba" by Joi Ito/Flickr, CC BY 2.0)

10 MOST DANGEROUS NATURAL DISASTERS

[Access multimedia content \(<https://openstax.org/books/population-health/pages/32-1-types-of-disasters>\)](https://openstax.org/books/population-health/pages/32-1-types-of-disasters)

Natural disasters cause widespread destruction and health risks within communities. This video describes the 10 most dangerous natural disasters.

Watch the video, and then respond to the following questions.

1. What are common causes of landslides?
2. Where is the most tornado-prone area in the world?
3. Why are earthquakes rated the most dangerous natural disaster?

Flooding, when excess water overwhelms normally dry land, is the most common natural disaster. Floods may result from heavy rainfall, rapid snowmelt, or a storm surge from a hurricane or tsunami in coastal areas and can cause widespread devastation, loss of life, and damage to property and critical public health infrastructure (WHO, 2023b). In 2022, a reported 176 floods affected over 57 million people globally, resulting in more than 7,000 deaths and \$44.9 billion in economic losses (CRED, 2023). There are three common types of floods:

- **Flash floods** are caused by heavy or excessive rain falling over a short time span, often less than 6 hours. Flash floods cause raging torrents that raise water levels quickly, sometimes overtaking roads, clearing away everything in their path.
- **River floods** occur when excessive rainfall or snowmelt forces a river to exceed capacity.
- Coastal floods are caused by **storm surges** associated with hurricanes and tsunamis. Storm surge is an abnormal rise of water generated by a storm, over and above the predicted astronomical tides (National Oceanic and Atmospheric Administration [NOAA], n.d.-b).

Tornadoes and hurricanes are characterized by high wind speeds and thunderstorms that can produce violent weather conditions, resulting in property destruction. Tornadoes and hurricanes have similar devastating effects,

such as high winds and water accumulations from rainfall, but each has its own distinctive dangers (Emergency Planning, 2017). Tornadoes are usually short-lived but have violent rotational winds of 100 to 300 miles per hour that extend from thunderstorms that come into contact with the ground (NOAA, n.d.). Often these storms are visible from miles away. Hurricanes occur in tropical climates. They are typically much larger storms than tornadoes and can span long periods of time in one area. This increases rainfall accumulation and makes the area more prone to flooding or storm surges. Hurricanes differ from tornadoes in that they have more sustained winds of at least 74 miles per hour rather than rotational winds. Based on the speed of the sustained winds, hurricanes are rated on a scale from one to five. The higher the rating, the greater the storm's potential for damage. While there have been advancements in storm predictions, there is no guarantee of safety in tornadoes, so the threat of tornadoes and hurricane activity should always be taken seriously (NOAA, n.d.-a, n.d.-c). Tornadoes can spawn from hurricanes, thereby increasing the risk of damage to life and property.

Human-Made Disasters

Human-made disasters are directly caused by people's actions that devastate and destroy human life. Examples include warfare (acts of terrorism and biological warfare), mass violence, shootings, industrial accidents, and nuclear/radiation incidents. Such disasters can be intentional or accidental, but they are always a result of human activity or neglect that causes damage to or loss of life or property.

Human-made disasters can be divided into three categories:

1. **Technological disasters**, also known as Natural Hazards Triggering Technological Accidents (**NA-TECH**) disasters, are technological accidents triggered by natural events. Often, technological accidents are foreseeable and preventable if the associated risks are managed responsibly and warning signs are not ignored (Krausmann & Necci, 2021). Examples include industrial accidents such as chemical spills, transportation accidents, and mining accidents.
2. **Social disasters**: Examples include warfare, genocide, civil unrest, and terrorism.
3. **Environmental disasters**: Examples include deforestation and wildfires due to arson.

Two well-known technological disasters are the Deepwater Horizon oil spill and the Chernobyl nuclear accident. Both were avoidable accidents resulting from systematic failures and human neglect. The morbidity and mortality of human and ecological life from both events were high and continue to have long-standing effects.

The Deepwater Horizon oil spill began with the explosion and sinking of an oil drilling rig in the Gulf of Mexico on April 20, 2010, resulting in the deaths of 11 workers and the largest offshore oil spill in the history of marine oil drilling operations. The accident dumped 134 million gallons of oil into the Gulf of Mexico over 87 days (EPA, 2022). The effects of the oil spill spanned 1,300 miles of shoreline along five U.S. states, killing thousands of marine life, birds, and sea turtles and contaminating their natural habitats (NOAA, 2017). This environmental contamination altered the marine ecosystem, thereby reducing the availability and sustainability of a major source of the U.S. seafood supply until the restoration of the ecosystem is complete.

On April 26, 1986, in a part of the former Soviet Union that is now Ukraine, a nuclear reactor in the Chernobyl Nuclear Power Plant exploded, causing fires and releasing radioactive material that contaminated the immediate area and many parts of Europe. The disaster resulted from a flawed reactor design operated by inadequately trained personnel. Two Chernobyl plant workers died in the explosion, and 28 people died from acute radiation syndrome within the following weeks. Long-term health effects from the disaster include approximately 5,000 cases of thyroid cancers, 15 of which resulted in fatalities (World Nuclear Association, 2022). Radiation fallout from the disaster was carried by wind and storm patterns over much of the northern hemisphere, although the amounts were insignificant in many cases (International Atomic Energy Agency, 2023).

TECHNOLOGICAL DISASTER: EAST PALESTINE, OH, TRAIN DERAILMENT

Access multimedia content (<https://openstax.org/books/population-health/pages/32-1-types-of-disasters>)

On February 3, 2023, a train carrying toxic chemicals derailed in East Palestine, Ohio. The derailment caused chemical contamination of the ground, water, and air. Following this disaster, some community members evacuated the area and sold their homes, while others evacuated and have since moved back.

Watch the video, and then respond to the following questions.

1. What was the immediate response to the trail derailment?
2. What were the immediate impacts of the derailment on the community? How might the community be impacted in the long term?
3. What methods were used to clean up the toxic chemicals in the ground, water, and air?

Examples of social disasters include warfare and terrorism, such as the Russian invasion and occupation of parts of Ukraine on February 24, 2022, which was a major escalation of the Russian-Ukrainian War that began in 2014, and the Boston Marathon bombing on April 15, 2013. Social disasters result in the loss of human life, physical and mental injury, damage to the local economy, and destruction of property, infrastructure, and environment. Social disasters may also give rise to social-political issues and civil unrest, impacting not only the local community but also the national and global community.

Environmental disasters are devastating events affecting an area's ecological system that destroy wildlife and pose a significant threat to humans. Wildfires are one example. In U.S. history, of the 58 wildfires considered the most destructive, almost 28 percent were attributed to arson—fires set intentionally. The community impact of these deliberate acts includes the destruction of 6,500 homes and businesses, 50 fatalities, and the devastation of one million acres of forests (Prell, 2017).

IMPACT OF WILDFIRES

Access multimedia content (<https://openstax.org/books/population-health/pages/32-1-types-of-disasters>)

Wildfires cause destruction of local life, property, infrastructure, agriculture, environment, and economy and displacement of the local population and wildlife. Additionally, the smoke from wildfires spreads hundreds of miles, affecting air quality. The video describes the impact of wildfires on humans.

Watch the video, and then respond to the following questions.

1. How did the wildfires in this video impact local residents?
2. Who is most vulnerable to reduced air quality due to wildfires?

Public Health and Safety Hazards of Disasters

Disasters pose significant health and safety risks at the community and individual levels, especially for vulnerable populations. Understanding the breadth and depth of the impact on communities and vulnerable populations requires the consideration of direct and indirect health effects. Risk factors are dynamic and can change based on social and political circumstances surrounding the disaster (Khorram-Manesh & Burkle, 2020).

Impact of Disasters: Communities

The direct impact of disasters on community health may include large numbers of injuries and deaths that overwhelm the local emergency response services and health systems. Damage to the health services infrastructure, roads and transportation, and communication systems; reduced resources, such as available health care staff; and increased need for additional equipment can impede health care providers' abilities to care for victims in the immediate response. It also affects the provision of follow-up care, which may have negative consequences for morbidity and mortality in the community. A significant risk of communicable diseases from a contaminated water supply, deceased animals, standing water, or other environmental factors may exist. Overcrowded health care facilities or living conditions compound the risk of infectious diseases. Food and water shortages pose a significant threat to the population, especially if the community is geographically challenging for responders to access. In addition, the psychological and psychosocial effects of witnessing and surviving catastrophic events may be substantial.

Indirect impacts on health because of disasters may include disruptions in modes of communication such as telephones, internet connections, and television services. Transportation may become limited due to damaged roads or highway infrastructure and vehicles. Community utilities, including electricity, water, and sewer systems, may be damaged or experience service disruptions.

Some communities are at greater risk during and following a disaster. Large populations, limited escape routes, population congestion, dense infrastructure, and low socioeconomic status increase community vulnerability (Donner & Rodriquez, 2011). Impoverished communities often have inadequate infrastructure to withstand a disaster and have disproportionately larger vulnerable populations.

A resilient community has the ability to recover from a disaster and can sustain itself in the face of hardship. Social connectedness is an essential characteristic of community resilience (Urban Footprint, 2023). Community members participate in their community, fostering a sense of togetherness and of feeling valued. Resilient communities also have social connections that provide emotional and physical support (Urban Footprint, 2023). Local organizations are trusted and provide needed community resources, such as food banks and financial assistance. Strong health care systems and government are prepared for disaster and recovery and have access to resources such as clean water and medical equipment. These communities continuously work on building resilience by improving social connections, ensuring government involvement in disaster management, improving risk communication to the entire community and vulnerable groups, improving community members' physical and mental health, and increasing community social and economic health (Urban Footprint, 2023).

Impact of Disasters: Vulnerable Populations

Vulnerable populations are those with characteristics that affect their capacity to anticipate, respond to, and recover from the impact of disasters. The most vulnerable populations are low-income populations, older adults, and ethnic and racial minorities.

Those of low socioeconomic status are less prepared for disasters (SAMHSA, 2017). This population often lacks the resources to afford mitigation efforts, such as strengthening household structures and purchasing disaster insurance. Financial resources are most often used for immediate needs rather than to prepare for a potential disaster in the future. Even more vulnerable are people with lower incomes who are also experiencing homelessness, women, or residents of public housing because they often lack finances and resources needed in case of evacuation (SAMHSA, 2017). These groups are less likely to evacuate prior to a disaster. Following a disaster, low-income populations have greater difficulty obtaining aid, housing loans, food assistance, assistance with evacuation and transportation, and access to medical resources (Martin, 2019; SAMHSA, 2017). Consequences of disaster for low-income populations include greater incidence of homelessness, unemployment, injury, mortality, economic loss, depression, and posttraumatic stress (SAMHSA, 2017).

Older adults are more vulnerable to disasters as compared to other age groups (American Red Cross, 2020). Mortality rates within this population following disasters are greater because older adults are more likely to have chronic conditions, comorbidities, cognitive impairment, and medication needs. A greater number of older adults are dependent on assistive devices and caregiver support and are socially isolated.

THE ROOTS OF HEALTH INEQUITIES

Spotlighting Health Disparities in the Face of Disaster: The Risk Project

Natural disasters disproportionately affect vulnerable populations, such as low-income or racial or ethnic minority groups. These groups are more likely to live in areas at high risk for natural disasters and in housing that poses safety risks when disasters occur. The Resilience in Survivors of Katrina (RISK) Project began as a research study in New Orleans, Louisiana, to examine the effects of economic and academic support on the retention of community college students. Over a 15-year period (2003–2018), researchers studied 1,019 parents who were low-income and primarily Black. In 2005, Hurricane Katrina disrupted the study, as many participants were hurricane victims. As a result, the study became the RISK Project, focusing on the effects and consequences of a disaster on vulnerable populations.

The results of the RISK Project have health policy implications for improving the quality of health for vulnerable populations and racial/ethnic minorities. The study found barriers to evacuation and care and a lack of long-term mental health services led to poorer health and psychosocial effects on individuals affected by disasters.

The recommendations for health policy included expanding avenues for primary prevention of disaster exposure.

- Protecting critical infrastructure and coastal wetlands to add a buffer to storm damage

- Revising building codes to require the elevation of new buildings and retrofitting existing buildings to provide flooding resilience
- Timely evacuation from at-risk areas and prohibiting employers from penalizing workers for early evacuation
- Providing public transportation for evacuation and affordable short-term housing for those who require evacuation and sustain damage to residences
- Improving post-disaster health care and mental health services, as physical and mental health are significantly affected by traumatic events

(See Raker et al., 2020.)

Assessment of Disaster or Public Health Emergency Risk

Beverly, the nurse described at the beginning of this chapter, conducted a community assessment to identify the needs of vulnerable populations within the community in the event of a hurricane. This assessment contributed to a larger assessment of the community disaster and public health emergency risk that assists the community in meeting the National Preparedness Goal, which outlines what entire communities need to prepare for different emergencies. The National Preparedness Goal is “a secure and resilient Nation with the capabilities required across the whole community to prevent, protect against, mitigate, respond to, and recover from the threats and hazards that pose the greatest risk” (Homeland Security, 2015). Community disaster and public health emergency risk assessment provides information for communities to plan for, protect, respond to, and recover from hazards.

Many frameworks are available to guide disaster risk assessment. For example, the [Threat and Hazard Identification and Risk Assessment \(<https://openstax.org/r/femagovsi>\)](https://openstax.org/r/femagovsi) (THIRA), which should be completed every three years using a collaborative community approach (FEMA, 2023; FEMA/Homeland Security, 2018), guides communities to identify:

- The threats and hazards that could affect the community
- The impact of those hazards on the community
- The capabilities that the community should have to respond to those hazards
- The current capabilities of the community
- The gap between the target capabilities and current capabilities

Communities use multiple resources, such as previous experience, existing hazard assessments, organizational and business risk assessments, and new data, to identify potential natural, technological, and human-caused hazards (FEMA/Homeland Security, 2018). The process begins by determining the likelihood and impact of the hazard. The community then identifies the effect of the location, magnitude, and time of the hazard. Finally, the current capability of the community to handle the hazard and target or goal for capability is determined. The gap between the current and target goal for capability directs the community to plan to decrease the gap.

One method, the Asia-Pacific Climate Change Adaptation Information Platform (AP-PLAT), guides communities through six steps to identify potential community hazards, areas of increased exposure to hazard, and areas of increased vulnerability utilizing mapping (AP-PLAT, 2022). [Table 32.1](#) provides details regarding the parts of the six-step disaster risk assessment process (AP-PLAT, 2022).

Step	Activities
1. Hazard analysis	<ul style="list-style-type: none"> • Identify patterns of community natural hazards. <ul style="list-style-type: none"> ◦ What is the potential impact? ◦ Will this hazard lead to another? ◦ Is the hazard local or distant? ◦ Are there seasonal patterns? • Identify potential human-made hazards. <ul style="list-style-type: none"> ◦ What is the potential hazard? ◦ Could this hazard lead to another? • Create a map depicting hazards identified within the community. A map is created for each season, if applicable.
2. Exposure assessment	<ul style="list-style-type: none"> • Identify people, infrastructure, and assets in locations that hazards could affect. This may include buildings, roads, farms, hospitals, schools, airports, industry, commerce, people, etc.
3. Vulnerability assessment	<ul style="list-style-type: none"> • Determine the probability that the community will be negatively affected by and vulnerable to a hazard. This includes estimating damages and the community's capacity to reverse or combat those damages.
4. Risk assessment and mapping	<ul style="list-style-type: none"> • Classify hazard risk as high, moderate, and low. • Place those hazard risks on a map. The map may include hazards and exposures.
5. Risk scenario development	<ul style="list-style-type: none"> • Describe a hazard event that could occur in the future. Assumptions regarding the hazard and impact are deduced from previous assessments.
6. Resource and capacity mapping	<ul style="list-style-type: none"> • Identify and map available resources and capacity used during the hazard event. Compare the map to the risk assessment map. • Develop a list of resources and capacity. • Identify gaps.

TABLE 32.1 The Six Steps of Disaster Risk Assessment (See AP-PLAT, 2022.)

Communities may use several tools, databases, and sources to complete disaster risk assessment. For example, the Federal Emergency Management Agency (FEMA) manages [The National Risk Index \(<https://openstax.org/r/hazardsfema>\)](https://openstax.org/r/hazardsfema), which is a tool that maps 18 natural hazards that impact the United States and identifies those most at risk. The Risk Index identifies potential natural hazards and ranks communities based on expected annual loss, social vulnerability, and community resilience. Communities are ranked according to risk. The higher the percentile, the greater the risk compared to other communities.

THEORY IN ACTION

The National Risk Index

The National Risk Index ranks natural disaster risk by U.S. county and census tract.

Use the [interactive map \(<https://openstax.org/r/hazardsfema>\)](https://openstax.org/r/hazardsfema) to explore your community's natural disaster risk, and then respond to the following questions.

1. What is your community's total risk index?
2. How does your community's expected annual loss, social vulnerability, and community resilience compare to other U.S. communities?
3. What are natural hazard types in your area?

The Social Vulnerability Index (SVI) database is used to locate the most socially vulnerable populations within a

community by census tract (Flanagan et al., 2018). SVI categories of vulnerability include socioeconomic status, household composition and disability, minority status and language, and housing and transportation. These vulnerability factors influence an individual's and community's capability to prepare for, respond to, and recover from disaster (Flanagan et al., 2018). This assists communities in identifying areas that may require additional assistance with disaster management.

Theory in Action

The Social Vulnerability Index

The Social Vulnerability Index (SVI) ranks a community's ability to respond to hazardous events across factors related to socioeconomic status, individual characteristics, housing type, transportation, and minority status.

Use the [interactive map](https://openstax.org/r/atsdrccgo) (<https://openstax.org/r/atsdrccgo>) to explore your community's SVI, and then respond to the following questions.

1. What is your community's most recent National Overall SVI Score? What does this mean?
2. View the Prepared County Map – Overall Social Vulnerability. Within your community, where are the most vulnerable located?
3. View the Prepared County Map – CDC/ATSDR SVI Themes. Which theme appears to affect your community most? Where are the most vulnerable, according to each theme, located? Other sources include existing hazard assessments and plans, historical data, homeland security data, private-sector assessments, and forecasting tools to determine future weather patterns, demographic shifts, or emerging threats (FEMA/Homeland Security, 2018).

32.2 Biological Terrorism

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 32.2.1 Define biological terrorism.
- 32.2.2 Categorize bioterrorism agents and diseases.
- 32.2.3 Describe how Category A agents have been or could be used as bioterrorist weapons.
- 32.2.4 Describe strategies for identifying and managing casualties of biological terrorism.
- 32.2.5 Explain the nurse's role in identifying and managing casualties of biological terrorism as a component of emergency preparedness and disaster response.
- 32.2.6 Explain the nurse's role as a first line of defense against biological terrorism.

Terrorist attacks use force or violence against civilians, cause mass property damage, and create fear and panic among the public. Chemical, biological, radiological, and nuclear (CBRN) agents have been used as weapons against humans, causing devastating health consequences (Bland, 2014). Chemical agents include nerve agents, vesicant agents, cyanides, pulmonary agents, incapacitants, toxic industrial chemicals, pharmaceuticals, and riot-control agents. Biological agents include live pathogens, such as bacteria, fungi, and viruses, and toxins derived from bacteria, fungi, plants, and animals. Radiological agents have ionizing radiation present, such as alpha, beta, gamma, and neutron particles. Nuclear agents are materials used to generate nuclear power.

Biological terrorism, or bioterrorism, is the intentional release of biological agents into the atmosphere or environment to threaten a civilian population. Humans and animals absorb the biological agent through inhalation, ingestion, skin, mucous membranes, or eyes (Bland, 2014). Bioterrorism can cause disease or death among a large number of people or livestock and can contaminate food or water supplies. Inhalation of biological agents poses the greatest risk for multiple casualties because the agent is transferred through the air and can reach larger numbers of the population (Bland, 2014).

Categorization of Bioterrorism Agents

As discussed in [Pandemics and Infectious Disease Outbreaks](#), biological agents that would likely be used as agents of bioterrorism include bacteria, viruses, and toxins. The CDC categorizes these agents by risk threat (see [Table 32.2](#) for examples). Most biological agents are difficult to grow and maintain, as many are destroyed quickly when

exposed to sunlight and other environmental factors (CDC, 2018; Siegel et al., 2023). Other agents, such as anthrax spores, are heartier and live much longer, especially on surfaces. Biological agents can be dispersed by spraying them into the air, infecting animals that carry the disease to humans, and contaminating food and water (Bland, 2014). Delivery methods include:

- Aerosols: Biological agents are circulated into the air via a fine mist that may carry for miles. Inhaling the agent may cause disease in people or animals.
- Animals: Diseases are spread by insects and animals, such as fleas, mice, flies, mosquitoes, and livestock.
- Food and water contamination: Pathogenic organisms and toxins are released into food and water supplies. If contamination is known, most microorganisms can be killed and toxins deactivated by cooking food and boiling water for 1 minute or longer.
- Person-to-person: Communicable diseases such as smallpox and plague can be spread via close human contact.

Category	Definition/Impact on Public Health	Agent/Disease
Category A—Highest priority	<ul style="list-style-type: none"> • Have the greatest impact on public health due to public panic and social disruptions • Easy to disperse and highly transmissible • High mortality rates • Special actions for public health preparedness 	<ul style="list-style-type: none"> • Anthrax (<i>Bacillus anthracis</i>) • Botulism (<i>Clostridium botulinum</i> toxin) • Plague (<i>Yersinia pestis</i>) • Smallpox (<i>variola major</i>) • Tularemia (<i>Francisella tularensis</i>) • Viral hemorrhagic fevers <ul style="list-style-type: none"> ◦ Filoviruses (Ebola, Marburg) ◦ Arenaviruses (Lassa, Machupo)
Category B—Second-highest priority	<ul style="list-style-type: none"> • Moderately easy to disperse • Moderate morbidity rates and low mortality rates • Require specialized disease surveillance by the CDC 	<ul style="list-style-type: none"> • Brucellosis (<i>Brucella</i> species) • Epsilon toxin of <i>Clostridium perfringens</i> • Threats to food safety (<i>Salmonella</i>, <i>Escherichia coli</i> 0157:H7, <i>Shigella</i>) • Melioidosis (<i>Burholderia pseudomallei</i>) • Psittacosis (<i>Chlamydia psittaci</i>) • Q fever (<i>Coxiella burnetii</i>) • Ricin toxin from <i>Ricinus communis</i> (castor beans) • Staphylococcal enterotoxin B • Typhus fever (<i>Rickettsia prowazekii</i>) • Viral encephalitis (alphaviruses, such as eastern equine encephalitis, Venezuelan equine encephalitis, and western equine encephalitis) • Threats to water safety (<i>Vibrio cholerae</i>, <i>Cryptosporidium parvum</i>)
Category C—Third-highest priority	<ul style="list-style-type: none"> • Have the potential for high morbidity and mortality rates with major health impacts • Pathogens that could be biologically engineered for mass dispersion because of availability, easy production, and dispersion 	Emerging infectious diseases (Nipah virus and Hantavirus)

TABLE 32.2 CDC 2018 Categorization of Biological Agents (See CDC, 2018; Siegel et al., 2023.)

Anthrax, a Category A agent, has been used for almost a century as an effective biological weapon, as it can be released quietly and discreetly. Anthrax spores are easily available in nature, can be produced in a laboratory, and remain persistent in the environment for a long period. The microscopic spores can be deployed in a powder or

spray and can be used to contaminate the air, food, and water supplies. They may be invisible to the naked eye, odorless, and tasteless (CDC, 2020). The German Army used biological agents against enemy countries during World War I, attempting to directly infect animals and contaminate their feed with anthrax (Frischknecht, 2003).

Anthrax was used in the worst biological attack in U.S. history, known as “Amerithrax” (FBI, n.d.). Following the terrorist attacks of September 11, 2001, letters laced with anthrax began circulating through the U.S. Postal Service (USPS), addressed to the offices of U.S. senators and national media outlets in Washington D.C., South Florida, and New York. Opening the letters released anthrax powder into the offices, where it was inhaled, ultimately causing the deaths of five victims and illness in 17 individuals. Panic and fear spread around the country, as it was unknown how many people had come into contact with these letters or how many other letters might be contaminated. This biological attack resulted in one of the largest and most complex law enforcement investigations to date (FBI, n.d.). The costs of human life, emotional distress, and resources were significant. Over 32,000 people exposed to anthrax were required to take prophylactic antibiotics, the USPS purchased 4.8 million masks and 88 million gloves for its employees, and 300 postal facilities were tested for anthrax. The investigation required extensive law enforcement resources. The Amerithrax Task Force comprised 25 to 30 full-time FBI investigators, the U.S. Postal Inspection Service, other law enforcement agencies, and federal prosecutors from the District of Columbia, and the Justice Department’s Counterterrorism Section spent hundreds of thousands of investigative hours on the case. These efforts involved more than 10,000 witness interviews on six different continents, the execution of 80 searches, and the recovery of more than 6,000 items of potential evidence during the investigation. More than 5,750 grand jury subpoenas were issued, and 5,730 environmental samples were collected from 60 sites. These efforts ultimately did not result in a conviction, as the suspect took his own life (FBI, n.d.).

ANTHRAX AS A WEAPON

[Access multimedia content \(<https://openstax.org/books/population-health/pages/32-2-biological-terrorism>\)](https://openstax.org/books/population-health/pages/32-2-biological-terrorism)

This video gives an overview of how and why anthrax has been used in biological warfare globally.

Watch the video, and then respond to the following questions.

1. What makes anthrax an effective biological agent for terrorists?
2. What do you think are the risks that stores of anthrax, intended for use as a biological agent in warfare, pose to the community?
3. Who do you think might be at risk of contamination when biological agents are dispersed via a federal communication system such as the USPS?

Identification and Management of Biological Casualties

Nurses within the community and acute care facilities must be prepared to identify and manage biological casualties. The United States remains vulnerable to bioterrorism. Biological agents like anthrax, botulinum toxin, and bubonic plague can cause a large number of illnesses or deaths in a short amount of time. An attack using a biological agent can mimic a natural outbreak or event, complicating public health assessment and response. Biological agents capable of secondary transmission can lead to epidemics, so early recognition of unusual circumstances is essential in prevention and response (WHO, 2023a).

The first step in identification is recognizing potential exposure to a biological casualty. Indications of biological agent exposure include (Bland, 2014):

- Reports of unexplained or unusual symptoms, such as headache, burns, vision problems, chest tightness, difficulty breathing, excessive secretions, nausea, vomiting, convulsions
- Multiple casualties with an unidentified cause
- Unusual taste, smell, or mist
- Unexplained dead animals or plants

Whenever the nurse suspects individual exposure to a biological agent, a thorough assessment should be completed only after ensuring personal safety. For example, the biological agent may have contaminated the individual's clothing, putting the nurse in danger of exposure. The nurse in this situation should don appropriate PPE, direct the individual to remove contaminated clothing, and follow procedures for decontamination, which

include washing with soap and water.

In the event of biological exposure and contamination, decontamination may be necessary. **Biological contamination** occurs when infectious agents come into contact with a body surface, inanimate objects, or food or water supplies. **Biological decontamination** includes disinfection or sterilization of the area to reduce the number of microorganisms to a safe level ([Table 32.3](#)) (Dembeck et al., 2011).

Method	Examples
Mechanical <ul style="list-style-type: none"> Removes but may not neutralize the agent 	<ul style="list-style-type: none"> Filtration of drinking water to remove water-borne pathogens Air filtration of aerosolized agents Scrubbing with soap and water to remove from skin or other surfaces
Chemical <ul style="list-style-type: none"> Neutralizes using liquid, gas, or aerosol disinfectants 	<ul style="list-style-type: none"> Sodium hypochlorite (bleach) and hydrogen peroxide Effectiveness dependent on contact time, concentration of solution, composition of the contaminated surface, and characteristics of the biological agent Disinfectant may be harmful to humans, animals, the environment, and/or other materials
Physical <ul style="list-style-type: none"> Use of heat or radiation to decontaminate surfaces or objects 	<ul style="list-style-type: none"> Sterilization using high temperatures

TABLE 32.3 Mechanical, Chemical, and Physical Methods of Biological Decontamination

The nurse compares individual assessment data to signs and symptoms of common biological agents to assist in diagnosis and potential treatment options. [Table 32.4](#) describes common agents of bioterrorism, method of transmission, signs and symptoms, and treatments. The nurse reports biological agent exposure to the local health department and the CDC.

Agent of Bioterrorism	Transmission	Signs & Symptoms	Treatment
Anthrax <i>Bacillus anthracis</i>	<ul style="list-style-type: none"> • Ingestion, contact, or inhalation of spores • Not spread person to person except cutaneous • 1 to 7 days incubation, up to 60 days 	<p>Cutaneous</p> <ul style="list-style-type: none"> • Painless, red papule evolving to black eschar <p>Ingestion</p> <ul style="list-style-type: none"> • Necrotic ulcers in GI tract, fever, nausea, vomiting progressing to hematemesis and bloody diarrhea • 25 to 60 percent fatality if untreated <p>Inhalation</p> <ul style="list-style-type: none"> • 4 to 10 days of flu-like symptoms (headache, fever, malaise, cough) followed by rapid deterioration with severe dyspnea and shock • 85 to 90 percent fatality if untreated 	60 days of doxycycline, ciprofloxacin, or levofloxacin
Botulism <i>Clostridium botulinum</i>	<ul style="list-style-type: none"> • Ingested or inhaled • Not spread person to person • 1 to 5 days incubation 	<ul style="list-style-type: none"> • Generalized weakness, dizziness, blurred vision, dysarthria, dysphagia, diplopia, followed by symmetrical descending flaccid paralysis 	<ul style="list-style-type: none"> • Antitoxin • Respiratory support, including mechanical ventilation if necessary

TABLE 32.4 Transmission, Signs and Symptoms, and Treatments of Common Agents of Bioterrorism (See Hayoun & King, 2022; Siegal et al., 2023.)

Agent of Bioterrorism	Transmission	Signs & Symptoms	Treatment
Ebola Ebola virus	<ul style="list-style-type: none"> Contact or inhaled 2 to 19 days incubation 	<ul style="list-style-type: none"> Fever, muscle pain, malaise, headache, vomiting, diarrhea, rapidly progressing to impaired organ function, hypotension, shock, bleeding, death 25 to 90 percent fatality rate depending upon strain of virus 	<ul style="list-style-type: none"> Monoclonal antibodies Supportive care Airborne precautions
Plague <i>Yersinia pestis</i>	<ul style="list-style-type: none"> Inhaled for pneumonic plague—spread through air and droplets, person to person (most deadly form) Vector for bubonic plague—spread through flea bites 1 to 4 days incubation 	<ul style="list-style-type: none"> Pneumonic—100 percent fatal if untreated: fever, chills, headache, cough, dyspnea, weakness progressing to hemoptysis, circulatory collapse, and bleeding Bubonic—swollen, tender lymph nodes; fever; headache, chills, weakness 	<ul style="list-style-type: none"> Streptomycin, ciprofloxacin, doxycycline, or chloramphenicol Droplet precautions All possible exposures treated prophylactically
Smallpox <i>Variola</i> virus	<ul style="list-style-type: none"> Inhaled or contact 7 to 19 days incubation 	<ul style="list-style-type: none"> Macular rash beginning in face and distal extremities, then moving to the trunk (rash appears after contagious) 	<ul style="list-style-type: none"> Cidofovir Smallpox vaccination within 72 hours of exposure Airborne precautions
Tuleremia <i>Francisella tularensis</i>	<ul style="list-style-type: none"> Inhaled, ingested, or vector through bites of infected ticks, mosquitos, flies, rodents, rabbits, or hares Not spread person to person 1 to 14 days incubation 	<ul style="list-style-type: none"> Malaise, cough, dyspnea, fever, weight loss 	Streptomycin, gentamicin, doxycycline, ciprofloxacin

TABLE 32.4 Transmission, Signs and Symptoms, and Treatments of Common Agents of Bioterrorism (See Hayoun & King, 2022; Siegal et al., 2023.)

Mass exposure to biological agents must be identified and managed as quickly as possible to prevent additional

exposure. Principles of mass exposure management include (Bland, 2014):

- Recognition of exposure
- Ensuring safety of the area through evacuation of nonessential personnel, use of PPE, and limiting additional exposure
- Establishing zones for decontamination, treatment, and safe or clean zones; see [Zoning of Care Areas](#)
- Setting up a command center and establishing a chain of communication
- Triage, assess, treat, and transport exposed individuals

The U.S. government remains in a constant state of readiness to protect Americans against the potential release of biological agents in terrorist threats and attacks. The **Strategic National Stockpile** (SNS) is part of the federal medical response infrastructure. The SNS supplements MCMs for states, tribal nations, territories, and metropolitan areas during public health emergencies. The stockpile has supplies, medicines, and devices for lifesaving care that can be used in the short term when the immediate supply of critical medical assets is unavailable or insufficient to meet the community's needs (Administration for Strategic Preparedness and Response [ASPRN], n.d.).

Federal law enforcement and health and safety agencies focus on risk assessments and ensuring that preventative **medical countermeasures** (MCM) are safe, effective, and secure. The U.S. Food and Drug Administration (FDA) Medical Countermeasures Initiative (MCMi) works at local, state, national, and international levels of government to support MCM-related public health preparedness and response efforts (FDA, n.d.). MCMs are used to prevent, diagnose, or treat conditions associated with biological agents and include:

- Biologic products, such as vaccines, blood products, and antibodies
- Drugs, such as antimicrobial medications, antiviral medications, antidotes, or radiation treatments
- Devices, including diagnostic tests to identify threat agents, and personal protective equipment (PPE), such as gloves, respirators, face masks, and gowns

The Nurse's Role in Bioterrorism Preparedness and Response

Nurses are essential members of the public health system. Public health and community health nurses must be prepared for the possibility of terrorist activity at any time. The American Nurses Association (2016) has developed policies, resources, and educational opportunities for nurses on disaster preparedness and acknowledges the importance of preparation so that nurses are equipped to respond to critical events. Nurses have a role in primary, secondary, and tertiary prevention for bioterrorism preparedness and response ([Table 32.5](#)). Refer to [Pandemics and Infectious Disease Outbreaks](#) for more information on conducting surveillance.

Primary Prevention

- Disease surveillance and preparation
 - Community health nurses are in ideal positions within communities to participate in surveillance. They must be alert to signs of possible terrorist activity, monitoring their communities for specific indicators of possible biologic terrorism, such as unusual numbers of dead or dying animals, unexplained serious illnesses or deaths, atypical vapors or odors in the environment, or unusual swarms of insects that might also indicate the use of biologic agents for terrorism. Diligent surveillance is essential in the early recognition of diseases caused by biological agents. Nurses work collaboratively in partnerships across disciplines for disease surveillance and to communicate vital information via appropriate channels to implement preparedness and response plans (Akins et al., 2005).
 - Creating, updating, and implementing a disaster plan is one of the most effective community-based strategies to mitigate injury and mortality from biological attacks. **Tabletop exercises**, sessions where key individuals who would respond to a disaster discuss their role and response in specific emergency situations, and **disaster simulations**, where key individuals respond to a specific emergency, simulate the disaster, and respond as if the situation were real, are useful strategies for ensuring that there is a stable response plan and that all team members know their role.

Secondary Prevention

TABLE 32.5 Nurses' Role in Primary, Secondary, and Tertiary Prevention for Bioterrorism Preparedness and Response

- Screening and treatment of the community's health needs
 - Recognition of disease states is key for early intervention during a bioterrorist attack. Nurses may be among the first to recognize the presentation of an unusual illness. The community health nurse must be prepared to act safely, access information rapidly, and use resources effectively (International Council of Nurses, 2019). The community health nurse may be called on to provide direct care to survivors, to serve as a hospital–community liaison, to set up and administer mass immunizations, to support shelters, to make home visits to affected families, to establish a case management system for survivors, or to serve on committees responding to terrorist acts.
 - In addition to large numbers of casualties, there may be widespread public panic and fear. The community health nurse must be competent to recognize and respond to the psychological needs of the victims, the public, and the workers responding to a terrorism event (International Council of Nurses, 2019).

Tertiary Prevention

- Rebuilding and long-term recovery of the community

Recovery and rebuilding a community may take a long time. Victims physically affected by biological agents require time to heal. Groups, families, or individuals who experience a terrorist-related event require ongoing care and recovery for the psychological toll caused by the epidemic of fear and panic (Radosavljević & Jakovljević, 2007).

TABLE 32.5 Nurses' Role in Primary, Secondary, and Tertiary Prevention for Bioterrorism Preparedness and Response

32.3 Mass Violence

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 32.3.1 Describe the term mass violence.
- 32.3.2 Examine U.S. mass shooting statistics.
- 32.3.3 Examine how mass violence can impact whole communities and the population at large.
- 32.3.4 Identify signs of emotional distress related to incidents of mass violence.
- 32.3.5 Discuss the principles of mass casualty management.

Mass violence refers to incidents of intentional criminal acts targeted at defenseless citizens with the intent to harm or kill large numbers of victims. Mass violence often occurs without warning and can happen anywhere, impacting whole communities and the country at large. These types of disasters, which include shootings and acts of terrorism, disturb the sense of order and safety in situations that are normally nonthreatening. The impact of mass violence is far-reaching, instilling feelings of confusion, fear, and helplessness. They violate the larger community's sense of safety and order, affecting even those without personal connections to the event (SAMHSA, n.d.). The most common manifestations of mass violence are:

- Mass shootings
- Terrorist bombings
- Mass riots
- Hijacking of aircraft, trains, buses, or other transportation services

Mass Shootings in the United States

Statistically, mass violence is uncommon, with mass shootings comprising most incidents. There is no standard definition of mass shooting, but there is a common definition for **active shooter**. An active shooter is an individual who is killing or attempting to kill people with a firearm within an area (USA Facts, 2023). Criteria to report mass shootings differ by the number of victims, whether injuries are included, the location of the shooting, whether it occurred with another crime, and the relationship between the shooter and the victims (Smart & Shell, 2021). More common definitions include an incident where four or more people have been murdered by a firearm or an event where at least four victims were injured or killed by a firearm. Although less than one percent of all firearm deaths annually in the United States are attributed to mass shootings, they have incited fear and panic beyond the direct victims and their families (Soni & Tekin, 2022). In the United States, the rate of mass shootings and the number of

people killed over the last four decades has increased, resulting in over 1,000 deaths and 1,500 injuries (NCMDI, 2019; Soni & Tekin, 2022). Federal funds to study gun violence were largely unavailable for about 20 years, but in 2019 the U.S. Congress approved funding for the CDC and National Institutes of Health to conduct gun violence research. This opened the door to new research on gun violence, suicide, and injury prevention (Weir, 2021). [Table 32.6](#) provides 2016–2022 statistics, highlighting the recent increase in mass shootings. [Table 32.7](#) compares the outcomes of the deadliest mass shooting incidents in the United States.

Source	2016	2017	2018	2019	2020	2021	2022
Gun Violence Archive (2023)	383	348	336	417	610	690	647
Everytown (2023)	372	341	329	410	605	686	636

*numbers vary based upon the definition of mass shooting

TABLE 32.6 Mass Shooting Incidents Since 2016

2017 Concert in Las Vegas, NV	60 killed	411 wounded
2016 Nightclub in Orlando, FL	49 killed	53 wounded
2019 Store in El Paso, TX	23 killed	23 wounded
2017 Church in Sutherland Springs, TX	25 killed	20 wounded
2022 Elementary School in Uvalde, TX	21 killed	17 wounded
2018 High School in Parkland, FL	17 killed	17 wounded

TABLE 32.7 Deadliest Mass Shootings in the United States, 2016–2022 (See Everytown, 2023; Statista, n.d.)

The Impact of Mass Violence

Mass violence and shootings have significant mental health effects on population health. These terrifying and traumatic incidents are often directed at strangers in public places. The community's response is defensive and urgent, demanding an explanation to try to make sense of the nonsensical. In the aftermath of mass violence, political leaders often blame mental illness, a narrative that echoes the public's common belief that individuals with mental illness generally pose a danger to others. It is difficult to comprehend the logic of mass violence or to imagine that a mentally stable person would intentionally kill multiple strangers; therefore, one might conclude that all perpetrators of mass violence must be mentally ill (NCMDI, 2019). However, according to a report from the U.S. Department of Homeland Security, the motives for mass violence are complex. The most common reasons relate to grievances, ideology, bias, political beliefs, and psychotic behavior (Alathari et al., 2023). Some offenders give multiple reasons for committing acts of mass violence, and others, killed during the event, never provide a reason. [Table 32.8](#) outlines cited motivations for mass violence events. Over half are attributed to personal, domestic, or workplace grievances, while only 14 percent are related to psychotic symptoms (Alathari et al., 2023).

Components to Motivate*	2016	2017	2018	2019	2020	Total
Grievances	40%	50%	68%	35%	60%	51%
Personal	5	9	11	8	13	46
Domestic	6	6	8	1	8	29
Workplace	2	6	3	4	3	18
Ideological, bias-related, or political beliefs	30%	24%	10%	21%	10%	18%
Psychotic symptoms	13%	26%	10%	15%	8%	14%
Desire to kill	13%	8%	3%	9%	3%	7%
Fame or notoriety	7%	8%	3%	6%	5%	6%
Other	3%	3%	10%	9%	8%	6%

TABLE 32.8 Motives for Mass Violence Over Time (See Alathari et al., 2023.)

Components to Motivate*	2016	2017	2018	2019	2020	Total
Undetermined	20%	8%	10%	29%	23%	18%

*The percentages for each year do not total 100% as some attackers had multiple motives.

TABLE 32.8 Motives for Mass Violence Over Time (See Alathari et al., 2023.)

Mental health issues related to mass violence events are correlated to direct victims, their families, and the general population. Research has shown that 48 percent of Americans live with the fear of becoming a victim of a mass shooting, and more than 10 percent have avoided large crowds or bought a weapon because they are worried about the threat of mass shootings (Brenan, 2019). Individuals living in the community or attending the school where a shooting has occurred have increased emotional distress, with a higher likelihood of taking antidepressants, engaging in risky behaviors, or considering suicide (Brodeur & Yousaf, 2022; Deb & Gangaram, 2023).

Public health and community health nurses and other health providers must be aware of the role of mental illness in mass violence for both victims and offenders to provide support and lead efforts to prevent mass violence (Alathari et al., 2023). Like many other community health concerns, preparation and prevention are key strategies for combating mass violence. Planning and participation in regular preparation activities like active-shooter drills supports proactivity and preparation for the worst-case scenario (Peterson & Densley, 2021).

A part of preparation, albeit not coordinated, is attention to warning signs. Warning signs include having behavioral problems or difficulty connecting with others, being noncommunicative, having aggressive or violent verbalizations, being withdrawn, harming self or others, and being emotionally unstable (Peterson & Densley, 2021). Education and advocacy programs for teachers, caregivers, and the public can go a long way in promoting awareness of behaviors that might be precursors to violence in individuals. Seemingly innocuous comments or interactions may be warning signs or cries for help (Peterson & Densley, 2021).

Mass Casualty Management

Mass casualty incidents (MCIs) are human-made or natural disasters that overwhelm the resources of local management agencies and the health care system. Emergency medical services (EMS) are often the first responders on the scene of a mass casualty event, but the principles of response apply to any health care responder. First responders are critical in triaging, stabilizing, and preparing to transport victims to health care facilities after MCIs. As the name implies, MCIs involve large numbers of victims who will need varying levels of care. Effective management, communication, and collaboration are essential during an MCI. Local community agencies, such as the fire department or police department, may respond, and state or national agencies may also become involved, depending on the type and severity of an MCI (Alpert & Kohn, 2023).

Response to a mass casualty event is complex, involving many people from different disciplines. Planning is a critical step to response, as a methodical approach to a crisis engages community responders in thinking through the lifecycle of a potential crisis, determining required capabilities, and establishing a framework for roles and responsibilities (FEMA, 2021). Since mass casualty disasters can happen without warning, a constant state of readiness requires training and regular drills. Simulations are frequently used to prepare health care workers and first responders for mass casualty management, as individuals must understand the roles that each one has in mass casualty response ([Figure 32.3](#)).

FIGURE 32.3 EMS staff participate in a training exercise to prepare for a mass casualty incident. (credit: “Mass Casualty Incident Training, Mammoth Hot Springs” by Neal Herbert/NPS/Flickr, Public Domain)

Multiagency, Interprofessional Team Coordination

The National Incident Management System (NIMS) provides a framework for the management of disasters and MCIs. NIMS guides the multiagency, interprofessional structure and organization for communication and incident command, allowing for efficient communication using common terminology, clarification of leadership and roles, and effective management and distribution of resources. [Figure 32.4](#) illustrates the organization of Incident Command System (ICS) used in NIMS. [Table 32.9](#) provides further description of the roles of command staff in the ICS.

ICS Command Function Organizational Chart

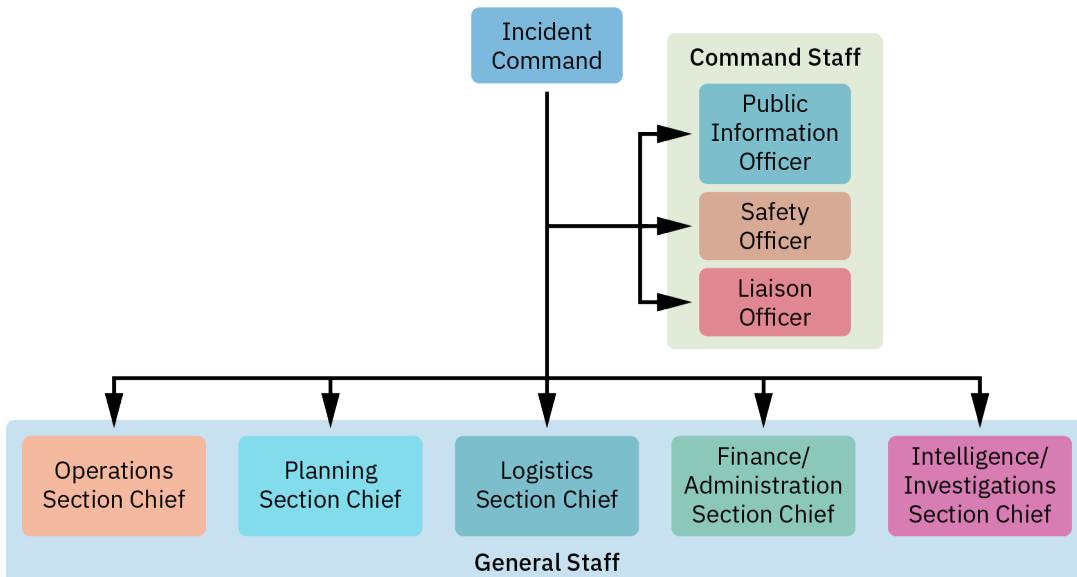

FIGURE 32.4 The ICS provides responders with a framework for organization, decision-making, and communication during a disaster or mass casualty event. (credit: modification of work “ICS Command Function Organization Chart” by FEMA, Public Domain; attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

Role	Function
Incident Command	<ul style="list-style-type: none"> Has overall responsibility for the incident Sets objectives for the incident and approves the incident action plan Manages the incident and approves requests
Public Information Officer	<ul style="list-style-type: none"> Develops and coordinates press releases Monitors and maintains information related to the incident
Safety Officer	<ul style="list-style-type: none"> Identifies and mitigates hazards Approves the Medical Plan Ensures safety messages and briefings are made throughout the incident
Liaison Officer	<ul style="list-style-type: none"> Communicates with cooperating agencies Maintains list of responders and responding agencies Monitors resources, providing current resource status, including limitations and capabilities of agency resources
Operations Section Chief	<ul style="list-style-type: none"> Organizes services and resources to carry out the plan Supervises operations Requests additional resources if needed
Planning Section Chief	<ul style="list-style-type: none"> Develops incident action plan to accomplish incident objectives Collects data related to the plan Facilitates meetings Assembles task forces if needed
Logistics Section Chief	<ul style="list-style-type: none"> Provides facilities, transportation, communications, supplies, fuel, food, and medical services for incident personnel Manages incident logistics Identifies anticipated services and support Oversees communications, medical, and traffic plans Oversees demobilization of logistics section and resources
Finance/Administration Section Chief	<ul style="list-style-type: none"> Monitors incident costs Provides financial guidance
Intelligence/Investigations Section Chief	<ul style="list-style-type: none"> Scope and function determined by the Incident Commander May be incorporated as a part of the planning section, operations section, or general staff section Prevents unlawful activity during incident Collects, processes, and analyzes information, evidence, and intelligence Investigates the cause of the incident and identifies suspects Conducts missing persons investigations

TABLE 32.9 ICS Command Roles and Functions (See FEMA, 2018.)

The Medical Branch (nurses and other health care staff) reports to the Operations Section Chief. This includes the medical director, who supervises triage, treatment, and transport of clients; the triage officer, who oversees triage of clients; the treatment officer, who manages the treatment area; and the transport officer, who arranges and documents transport of clients from the scene (Lincoln et al., 2023). Additional roles may be added depending upon the number of clients and the time needed to manage medical needs.

Scene Safety Considerations

When responding to a mass casualty incident, there are several issues that must be considered to effectively manage the scene and victims for optimal outcomes.

- Scene Safety

- The top priority on the scene of an MCI is the safety of the responders. Verifying that the scene is safe before first responders provide care prevents secondary incidents and subsequent injuries (Alpert & Kohn, 2023). Scene security and the responsible agency will depend on the nature of the MCI. If the event is a vehicular accident, the environment around the scene should be assessed for fuel leakage, fire hazard, and other risks that would further endanger victims or responders.
 - Appropriate personal protective equipment (PPE) needs to be available and used by responders to a chemical, biological, radiological, or nuclear event.
 - In response to a terrorist or mass violence attack, the possibility of an explosive detonation or a suicide bomber should be considered and bomb disposal experts dispatched before responders begin lifesaving measures.
 - In a mass shooting incident, if the offender has not been apprehended or has fled the scene, first responders must not approach the scene unless they are trained in tactical medicine and are wearing appropriate protective gear.
 - The response to or after a fire poses a risk of building collapse and inhalation (Alpert & Kohn, 2023).
- Field Triage
 - After scene safety, mass casualty response requires field triage of victims. Examples of field triage systems will follow later in this chapter.

THEORY IN ACTION

Situational Awareness in Multi-casualty Incidents

[Access multimedia content \(<https://openstax.org/books/population-health/pages/32-3-mass-violence>\)](https://openstax.org/books/population-health/pages/32-3-mass-violence)

Nurses and other field-level providers increasingly will be called on to respond to both natural and human-made situations that involve multiple casualties. Situational awareness (SA) is necessary for managing these complicated incidents. SA is the ability to perceive, understand, and respond to the current situation. Basically, it is knowing what is going on in the environment, recognizing unsafe situations, and responding to the situation in a safe, efficient way. Situational Awareness For Emergency Response (SAFER) utilizes technology to access building information and video surveillance when responding to emergencies.

Watch the video, and then respond to the following questions.

1. Why is situational awareness important when responding to a hazardous event?
2. What information does SAFER give to responders?
3. How can SAFER be used during response to a disaster?

Zoning of Care Areas

In an MCI, the area of care is divided into zones if there is a risk of chemical, biological, radiological, or nuclear contamination ([Figure 32.5](#)) (Alpert & Kohn, 2023).

- The hot zone is the immediate location of the incident, where victims and responders have direct contamination.
- The warm zone is the area surrounding the hot zone where contamination is present from victims or responders leaving the hot zone. Triage and decontamination can occur in the warm zone to neutralize the risk to victims.
- The cold zone is where care for victims occurs and may serve as the location for minor casualty holding or release.

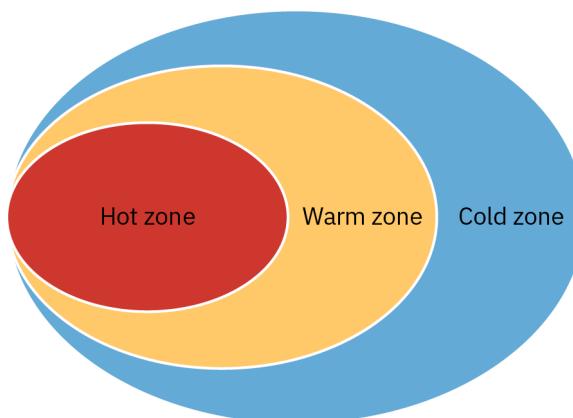

FIGURE 32.5 During an MCI, responders divide care into hot, warm, and cold zones if there is a chemical, biological, radiological, or nuclear contamination risk. (attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

32.4 The Disaster Management Cycle

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 32.4.1 Describe the disaster management cycle.
- 32.4.2 Explain the nurse's role in the disaster management cycle.
- 32.4.3 Discuss how community partners work together to prevent, prepare for, respond to, and recover from disasters.

A planned, systematic approach to disaster management allows community members, health care providers, emergency response agencies, and community organizations to respond to disasters and mass causalities effectively and efficiently. Community assessment identifies potential disasters, enabling planning to prevent, prepare, and respond to reduce their impact. Nurses play an integral role in all phases of the disaster management cycle. Multisector, interprofessional collaboration enhances disaster prevention, preparation, and response.

Phases of the Disaster Management Cycle

To establish a plan for disasters, the nurse must understand the phases of the **disaster management cycle** (Figure 32.6). The public health/community health nurse has an important role in each phase to promote optimal health outcomes for the people involved.

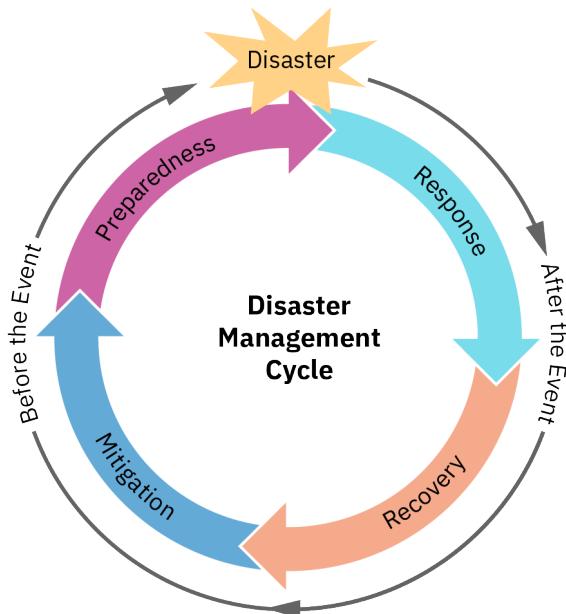

FIGURE 32.6 The disaster management cycle has four phases. (attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

Mitigation, an action to prevent or reduce the cause, impact, or consequences of a disaster, is the first phase of the disaster management cycle. A community assessment identifies community risk factors. This includes determining what natural disasters the community is likely to face. For example, communities geographically situated in coastal regions are at risk for hurricanes or tsunamis. This also includes identification of potential targets of terrorist attacks and potential human-made disasters, such as the release of dangerous chemicals from a factory following an explosion. Community programs focused on preventing the occurrence and mitigating the impact of disasters are developed and implemented (Homeland Security, 2015). For disasters that cannot be prevented, such as earthquakes, hurricanes, and tornadoes, efforts may focus on mitigating the effects of the event on the community. Examples of mitigation include placing sandbags along a river to decrease the amount of floodwater, constructing levees or barriers to prevent or control flooding, boarding windows before a hurricane makes landfall, and improving building infrastructure to reduce the risk of damage during an earthquake.

Preparedness is the second phase of the disaster management cycle. It includes planning, training, and educational activities to address the consequences of disasters that cannot be mitigated. Preparedness is a continuous state of planning for rapid response when a disaster occurs. Task forces made up of community representatives from the local government, health care providers, social services providers, police and fire departments, major industries, local media, schools, and citizens' groups form to ensure that each area of the community knows its role and has a plan in place for when a disaster occurs. In the preparedness phase, responding personnel from each agency are trained. This training includes drills or simulations of mock disasters. Public education is key in providing community members with information on how they can best prepare their families and whom to contact if they are directly impacted by a disaster (FEMA, 2021). The disaster preparedness plan includes what to do in case of disaster, where to go, who to call for help, identifying home vulnerabilities, and accumulating disaster supplies/equipment.

EMERGENCY PREPAREDNESS HOME TOUR

[Access multimedia content \(<https://openstax.org/books/population-health/pages/32-4-the-disaster-management-cycle>\)](https://openstax.org/books/population-health/pages/32-4-the-disaster-management-cycle)

Personal and family preparedness is a professional nurse disaster competency. In this video, a city councilor from Gresham, Oregon, describes how families can prepare their homes in case of an emergency or disaster.

Watch the video, and then respond to the following questions.

1. How does the family plan for disaster within their home?
2. How does your personal preparedness home plan compare to the video?

For more information on developing a personal preparedness plan, visit the [American Red Cross Disaster Preparedness Plan \(<https://openstax.org/r/redcrosso>\)](https://openstax.org/r/redcrosso) or Minnesota Department of Public Safety website on [Personal and Family Preparedness \(<https://openstax.org/r/mngovdivision>\)](https://openstax.org/r/mngovdivision).

Disaster response is the third phase of the disaster management cycle. Disaster response is the execution of the disaster plan when a disaster event occurs. Disaster response management is a local community responsibility that begins before the announcement of an official disaster declaration (Klein & Irizarry, 2022) and continues for the first 72 hours (deAnda et al., 2022). If local resources are depleted after 72 hours and cannot be managed, the Stafford Disaster Relief and Emergency Assistance Act allows the state governor to request a disaster declaration from the president of the United States. This declaration mobilizes federal resources to assist local agencies in the aftermath of a disaster (deAnda et al., 2022).

Disaster recovery, the fourth phase of the disaster management cycle, begins during the response phase once the threat to human life and infrastructure has passed. Recovery efforts aim to return a community to some degree of normal predisaster functioning (Klein & Irizarry, 2022). The simultaneous work of rebuilding and resuming regular operations and activities may require a prolonged period. Disaster recovery includes rescue work to provide relief, primarily immediate medical care, food and water, clothing, and shelter (Polcarová & Pupíková, 2020). Once people's immediate needs are met, restoring public services such as communication and transportation begins the process of returning to normalcy. Rebuilding community infrastructure may be a long-term course but may also present improvement opportunities (Polcarová & Pupíková, 2020).

HEALTHY PEOPLE 2030

Emergency Preparedness

These Healthy People 2030 objectives aim to [improve emergency preparedness](https://openstax.org/r/healthypeopleo) (<https://openstax.org/r/healthypeopleo>) and response by building community resilience. The following general emergency preparedness objectives are in the developmental stage:

- Increase the proportion of parents and guardians who know the emergency or evaluation plan for their children's school — PREP-DO1
- Increase the proportion of adults who prepare for a disease outbreak after getting preparedness information — PREP-DO2
- Increase the proportion of adults who know how to evacuate in case of a hurricane, flood, or wildfire — PREP-DO3
- Increase the proportion of adults who have an emergency plan for disasters — PREP-DO4

The Nurse's Role in the Disaster Management Cycle

The ANA (2016) considers disaster preparedness and response a basic competency of nursing practice. While most nurses may not have extensive experience in disaster response, they are expected to have minimum knowledge about disaster management. They participate in preparedness planning and training drills, and they have skills and abilities to provide client care and community support during a disaster. Community health nurses collaborate with health care professionals and partner with health system leaders, individuals, and families to improve population health outcomes and promote community resiliency when disasters occur (Chegini et al., 2021).

Nurses are an important part of all phases in the disaster management cycle. Understanding the inherent risks a community faces for different types of disasters is critical in the mitigation phase. If a community is at a higher risk of a particular type of disaster, then more time and resources can be focused on activities that will prevent losses. For example, community health nurses who work in areas at risk for tropical weather may need to spend more time mitigating the effects of hurricanes than the risk of forest fires. Public safety education helps people in the community understand the potential hazards and effects of the disasters for which their community is at greatest risk. Community education on strategies to mitigate hazards and how to respond in case of a disaster raises individuals' awareness and increases the likelihood that they will develop a disaster plan. Families should know what to do, who to call, and where to go in emergencies. When individual community members are generally disaster-aware, they can immediately implement the personal disaster response plan as needed. The nurse plays a key role in educating community members on disaster preparedness.

CLIENT TEACHING GUIDELINES

Disaster Preparedness

Community education for disaster preparedness includes:

- Create a [family preparedness plan](https://openstax.org/r/readygovp) (<https://openstax.org/r/readygovp>) that includes an [evacuation plan](https://openstax.org/r/readygovev) (<https://openstax.org/r/readygovev>). Review the plan annually.
- Determine a family communication plan that includes an emergency meeting place. How will you communicate if phone lines and towers are not working?
- Assemble a [disaster kit](https://openstax.org/r/readygovkit) (<https://openstax.org/r/readygovkit>). Inventory the kit at least annually, replacing expired items.
- Assemble an [emergency kit](https://openstax.org/r/readygovcar) (<https://openstax.org/r/readygovcar>) for your vehicle.
- Store important documents in a waterproof, portable container.
- Make a [plan for your pets and animals](https://openstax.org/r/readygovpets) (<https://openstax.org/r/readygovpets>).
- Secure property prior to a disaster.

(See U.S. Department of Homeland Security, 2023.)

The nurse must be involved in preparedness activities and participate in disaster management education and training from the beginning of nursing education programs (ANA, 2016). Many organizations provide practicing nurses opportunities for further education to build the skills to prepare for and respond to emergencies. The FEMA Emergency Management Institute has a curriculum of disaster preparedness and response online courses available to the public free of charge at this [link](https://openstax.org/r/trainingfemago) (<https://openstax.org/r/trainingfemago>).

Collaboration with federal, state, and local relief agencies and organizations is critical in preparedness activities. Organizations like FEMA, the American Red Cross, state officials, and local emergency medical services come together to practice disaster response. Mock drills are simulation exercises that are regularly conducted to ensure community members and responders have practiced how to respond appropriately in disasters. Nurses should help plan and participate in these mock drills that simulate the type of disaster the community is most likely to have. Tabletop exercises are also useful for frequently reviewing disaster policies and procedures.

HURRICANE TABLETOP EXERCISE

[Access multimedia content \(<https://openstax.org/books/population-health/pages/32-4-the-disaster-management-cycle>\)](https://openstax.org/books/population-health/pages/32-4-the-disaster-management-cycle)

Tabletop exercises are discussion sessions where community members discuss their roles and responses during a specific emergency or disaster. This video discusses the benefits of conducting tabletop exercises.

Watch the video, and then respond to the following questions.

1. Why does this community complete hurricane tabletop exercises annually?
2. What are the benefits of testing the emergency plan using a tabletop exercise?

As care providers, nurses are often among the first to respond to health care needs in disaster situations. Lifesaving actions, injury treatment, and minimizing the effects of the disaster are the priority. Immediate needs such as medical treatment, shelter, food, water, and psychological support for survivors are the primary focus. The COVID-19 pandemic brought nursing disaster response to the forefront. Nurses worked tirelessly in their community hospitals, providing client care at the bedside, and the need for nurses to provide client care on the front lines was greater than the number of nurses available in many areas. In January 2020, the CDC activated the Incident Management System in response to the COVID-19 crisis. The CDC and Agency for Toxic Substances and Disease Registry Nurses' Work Group (CNWG) helped to distribute and meet requests for nurse deployments to support the COVID-19 response (Zauche, 2022). The group used an Emergency Operations Management System application to track the work hours of those who contributed to the response. Among 190 CNWG members, 146 (76.8 percent) were deployed to work between January 21, 2020, and September 18, 2021. Combined, they recorded more than 24,600 days and nearly 198,000 hours on the response. Nurses worked in local facilities and with state public health agencies and departments throughout the pandemic as policy experts, contact tracers, researchers, epidemiologists, nurse consultants, and client advocates (Zauche, 2022).

Nurses also have a role in helping the community return to normalcy in the recovery period. They work collaboratively across disciplines to restore health care to optimal operations along the recovery continuum, adjusting according to the community's needs. Nursing assessment and intervention during the recovery stage include monitoring and screening for communicable and infectious diseases, educating on water and food safety, educating on cleanup and disposal of debris and deceased livestock/animals, eliminating safety risks, and screening and treatment for mental health issues. Nurses have been essential in the post-pandemic phase of the COVID-19 pandemic. Nurses led the way in vaccine education, distribution, and coordination of administration in vaccine clinics. These efforts were essential to reestablishing health care to its modified baseline, and they have been active participants in creating new policies and practices to help prevent a resurgence.

UNFOLDING CASE STUDY

Part A: Disaster Management

Read the scenario, and then answer the questions that follow.

Juanita, a public health nurse on the Florida Coast, is a member of the disaster management team. In anticipation of the approaching hurricane season, Juanita reviews disaster prevention and mitigation plans for the community. She assesses the community for the most vulnerable individuals (those with physical and mental disabilities) and maps their locations. She also plans nursing interventions to mitigate the effects of the hurricane.

Juanita meets with the multiagency, interprofessional team during a tabletop exercise on hurricane disasters. She shares the location of the most vulnerable individuals in the community because they may require well-being checks or evaluation during power and phone outages. She provides input from a nursing perspective on potential sheltering locations, shelter resource needs, and the triage and transport process. Juanita suggests including surrounding communities in the hurricane disaster plan to prepare for increased population and health needs in their communities due to population displacement before and following hurricane landfall.

- 1.** What is another vulnerable population that may require well-being checks during emergency events and disasters?
 - a. Older adults
 - b. Single parents
 - c. Persons with substance-use disorder
 - d. Young adults

- 2.** Which nursing intervention would be appropriate to mitigate the effects of a hurricane disaster?
 - a. Conduct a simulation to practice triage in mass casualty situations.
 - b. Teach classes on family safety planning prior to hurricane season.
 - c. Draw a shelter blueprint to prepare for mass food, water, and health needs.
 - d. Lead a tabletop exercise on hurricanes with health department staff.

Community Collaboration and Disasters

With the rising incidence of disasters, it is essential that public health professionals engage internal and external partners to promote community resilience and return to normalcy. Disasters present complex challenges for which no single discipline, agency, organization, or jurisdiction can or should bear sole responsibility (Association of Public Health Nurses [APHN], 2014). Community resilience after disasters is dependent on coordinated care and resource distribution. To gain the respect and confidence of the public, local agencies and leaders must manage disaster response and collaborate effectively to achieve optimal outcomes for the community (Charney et al., 2018).

Multisector, interdisciplinary collaboration is necessary at the community level during each stage of the disaster management cycle. Most often, the public health agency leads prevention and preparedness efforts within a community. Community partners who respond to and are affected by disasters are invited to participate in disaster management activities. This includes emergency response coordinators; emergency department managers; epidemiologists; nurses; emergency medical services; law enforcement; fire services; academic institutions; Medical Reserve Corps; private businesses; faith-based organizations; humanitarian organizations; nonprofit organizations; medical, health, and behavioral providers; and other community-based organizations (RHIhub, 2023). The disaster management team collaborates to assess the community for risk factors, plans efforts to mitigate disaster effects, and prepares for potential disaster through tabletop exercises and disaster simulations. Prevention and preparedness activities identify areas of strength, accessible resources, and areas for improvement.

The disaster management team utilizes the NIMS framework and ICS during disaster response and recovery to establish leadership, organize resources, and communicate effectively. When local resources are depleted, state partners, such as the National Guard, state emergency management agency, state health department, and governor's office, and federal partners, such as FEMA, National Disaster Medical System, Environment Protection Agency, and U.S. Department of Health and Human Services Incident Response Coordination Team, may join disaster response efforts. [Table 32.10](#) describes the role of various disaster response organizations and partners.

Local Partners	
<ul style="list-style-type: none"> • Immediate response to local disasters • Establish preparedness plans • Conduct mitigation efforts 	
Emergency response coordinators	<ul style="list-style-type: none"> • Establish local emergency action plans • Identify potential hazards within the community • Develop mitigation plans • Coordinate emergency response
Medical and mental health providers including nurses	<ul style="list-style-type: none"> • Triage, assessment, and treatment of victims • Participate in mitigation and preparedness activities • Ensure adequate resources for medical and mental health care • Educate on mitigation, preparedness, and risks following disaster
Emergency medical services	<ul style="list-style-type: none"> • Provide immediate response to disaster events
Law enforcement	<ul style="list-style-type: none"> • Provide immediate response to disaster events • Assist with scene safety, response, and logistics • Educate on disaster prevention, preparedness, and response
Fire services	<ul style="list-style-type: none"> • Provide immediate response for fire suppression, emergency medical response, and hazardous materials response • Assist with scene safety • Educate on fire prevention and response
Medical Reserve Corps (https://openstax.org/r/asprhsgov)	<ul style="list-style-type: none"> • Assist in response to community health needs by offering medical support, shelter support, surge support, dispensing efforts, first-aid response, and community outreach
Hospitals and health care services	<ul style="list-style-type: none"> • Provide treatment during disaster • Educate on mitigation and preparedness
Humanitarian organizations	<ul style="list-style-type: none"> • Assist with sheltering, transportation, food, water, and resource distribution
Faith-based organizations	<ul style="list-style-type: none"> • Assist with sheltering, transportation, food, water, and resource distribution • Provide spiritual resources
State Partners	
<ul style="list-style-type: none"> • Provide recommendations for and approval of local emergency preparedness plans • License professionals • Assist in disaster response and recovery when local resources are exhausted 	
State National Guard	<ul style="list-style-type: none"> • Assist with transportation, communications, public works and engineering, emergency management, mass care, search and rescue, and hazardous materials management
State Public Health Associations	<ul style="list-style-type: none"> • Approve local emergency preparedness plans • Provide training exercises and education on disaster management
National and Federal Partners	

TABLE 32.10 Partners and Organizations Involved in Disaster Management

- Recommend guidelines for disaster management
- Assist in disaster response and recovery when National Emergency declared or when state resources are exhausted

<u>U.S. National Response Team</u> (NRT)	<ul style="list-style-type: none"> • Provides assistance, resources, and coordination in response to land, air, and water pollution incidents
<u>U.S. Environmental Protection Agency</u> (EPA)	<ul style="list-style-type: none"> • Provides leadership and assists with prevention and preparation for chemical emergencies • Responds to environmental disasters • Educates about chemical hazards
<u>National Guard</u> (National Guard)	<ul style="list-style-type: none"> • Assists with transportation, communications, public works and engineering, emergency management, mass care, search and rescue, and hazardous materials management
Federal Emergency Management Agency (FEMA) National Incident Management System (<u>NIMS</u> (NIMS))	<ul style="list-style-type: none"> • Coordinates response of federal agencies to disasters • Provides guide for All-Hazards Emergency Operations Planning • Educates on NIMS and the National Response Framework (<u>NRF</u> (NRF))
Department of Health and Human Services (HHS)	<ul style="list-style-type: none"> • Coordinates federal health, medical, and social services • Includes the <u>Office of Human Services Emergency Preparedness and Response</u> (<u>https://openstax.org/r/acfhhsgovoh</u>): collaborates with FEMA to coordinate services during disasters
<u>Homeland Security</u> (DHSGOV)	<ul style="list-style-type: none"> • Provides national security from threats (aviation and border security, emergency response, cybersecurity, terrorism)
Centers for Disease Control and Prevention (CDC)	<ul style="list-style-type: none"> • Educates on health and health threats, including disaster preparedness and response • Responds to health threats • Investigates disease outbreaks
American Red Cross	<ul style="list-style-type: none"> • Private, volunteer agency • Provides immediate disaster relief (shelter, food, health services)

TABLE 32.10 Partners and Organizations Involved in Disaster Management

32.5 The Nurse's Role in Emergency Preparedness and Disaster Response

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 32.5.1 Explain the nurse's role in emergency preparedness, disaster response, and disaster recovery.
- 32.5.2 Compare the stages of disaster to the nursing process.
- 32.5.3 Describe disaster triage.

Community health nurses are well positioned to respond in times of disaster and maintain a constant role across the disaster cycle of preparedness and national planning framework (APHN, 2014). From emergency preparedness to disaster recovery, they work with individuals, families, the community, and local administrators to promote health and well-being and to prevent illness (Siva & Prema, 2018). Community health nurses are not only acute-care providers or first responders, but they also maintain a long-term focus on a healthy community during the disaster

phases. Their knowledge of and skills in epidemiology, determinants of health, community mapping, risk assessment, disease surveillance, community resources, health teaching, and mass education make them effective members of the disaster management team. Their relationships with and intimate knowledge of how people in the community will respond to a crisis and what resources they may use or benefit from make them trusted health care professionals during times of uncertainty (APHN, 2014; Siva & Prema, 2018).

As discussed, emergency preparedness is an essential role for the community health nurse. Having a workable plan that can be implemented in an immediate response to a disaster is critical. Community health nurses should be ready to expand their role in nonroutine practice areas during the response to a mass casualty event. The competencies expected of the community health nurse include emergency readiness and response and ensure the nurse's ability to understand and execute the necessary skills and behaviors in the event of an incident (International Council of Nurses, 2019). [Table 32.11](#) lists disaster competencies for the general professional nurse, or nurses who have completed undergraduate nursing education programs. The competencies fall within eight disaster management domains.

Domain	Competency
1. Preparation and Planning	<ul style="list-style-type: none"> Maintains a personal and professional preparedness plan Participates in disaster exercises in the workplace Maintains knowledge of available emergency resources, plans, policies, and procedures Describes methods to assist vulnerable populations during a disaster response
2. Communication	<ul style="list-style-type: none"> Uses disaster terminology correctly when communicating Communicates disaster priority information promptly to appropriate individuals Demonstrates basic crisis communication skills during disaster events Uses culturally and linguistically appropriate resources to communicate with populations Documents essential assessment and intervention
3. Incident Management	<ul style="list-style-type: none"> Describes the national structure for response to a disaster Uses disaster planning chain of command relevant to workplace and/or disaster drill Contributes to post-event evaluation Practices within license scope of practice during a disaster
4. Safety and Security	<ul style="list-style-type: none"> Maintains safety for self and others throughout a disaster event Adapts basic infection control practices to the available resources Assesses self and others during a disaster event to identify the need for physical or psychological support Uses PPE as directed during a disaster event Reports possible risks to personal or others' safety and security
5. Assessment	<ul style="list-style-type: none"> Reports symptoms or events that might indicate the onset of an emergency or disaster Performs rapid physical and mental health assessments based upon principles of triage and the type of disaster Maintains ongoing assessment for needed changes in care in response to an evolving disaster

TABLE 32.11 Disaster Competencies for the General Professional Nurse (See International Council of Nurses, 2019.)

Domain	Competency
6. Intervention	<ul style="list-style-type: none"> • Implements basic first aid as needed by individuals in the immediate vicinity • Isolates persons at risk of spreading communicable conditions to others • Participates in contamination assessment or decontamination of individuals when directed through the chain of command • Engages clients, family members, or volunteers, within their abilities, to extend resources during disasters • Provides client care based on priority needs and available resources • Participates in surge capacity activities, such as mass immunization • Adheres to protocol for management of large numbers of deceased persons in a respectful manner
7. Recovery	<ul style="list-style-type: none"> • Assists in organization to maintain or resume functioning during and post disaster • Assists assigned clients to maintain or resume functioning during and post event • Makes referrals for ongoing physical and mental health needs • Participates in transition debriefing to identify personal needs for ongoing assistance
8. Law and Ethics	<ul style="list-style-type: none"> • Practices within nursing and emergency-specific laws, policies, and procedures • Applies disaster ethical framework in care • Demonstrates understanding of ethical practice during disaster response based on utilitarian principles

TABLE 32.11 Disaster Competencies for the General Professional Nurse (See International Council of Nurses, 2019.)

Stages of Disaster Response and Recovery

When communities face a disaster, the success of the response and recovery depends on a common, interoperable approach to sharing resources, coordinating and managing incidents, and communicating information (Homeland Security, 2019). The [National Response Framework \(NRF\) \(*https://openstax.org/r/femagovsites*\)](https://openstax.org/r/femagovsites) provides foundational emergency management guidelines for response (Homeland Security, 2019). The [National Incident Management System \(NIMS\) \(*https://openstax.org/r/femagovsitesdefa*\)](https://openstax.org/r/femagovsitesdefa) was developed by the Department of Homeland Security in 2004 within the NRF to establish a standardized set of processes and procedures that guides emergency responders at all levels of government organizations, nongovernmental organizations, and the private sector to conduct response operations (FEMA, 2017). The NRF and NIMS identify key roles and responsibilities at each stage of disaster response. The NRF can be partially or fully implemented when there is a threat or hazard, a significant event is anticipated, or in response to an incident (Homeland Security, 2019).

Disaster response and recovery occurs in stages that occur sequentially as the incident develops. These stages are grouped by activities with a common purpose so that emergency response is well organized and sequenced through specific intervals of an incident (HHS, 2012).

- Stage 1: Incident Recognition—A rapid assessment of the situation is completed, and the organization decides that emergency-related support and response is needed.
- Stage 2: Initial Notification and Activation—Initial notification and activation occur simultaneously. Appropriate organizations within the response system are notified of the incident. Urgent information is provided about the incident, and guidance is provided about the actions the community should take. Activation determines the response level to the incident and activates the emergency response procedures.
- Stage 3: Mobilization—This is the movement of the organization from a state of inactivity or baseline operations to the required response level.
- Stage 4: Incident Operations—This refers to all actions that address the response objectives following activation (other than mobilization and demobilization). The actions in this stage may be further divided into “initial” (or “immediate”) and “ongoing” categories.
- Stage 5: Demobilization—This stage addresses the transition of resources from response activities back to baseline operations. Demobilization procedures are triggered as response objectives are achieved and resources are relieved of incident responsibilities.

- Stage 6: Transition to Recovery and Return to Readiness—This stage is a return to a state of readiness for the next emergency.

The Nursing Process Applied to Disaster Response and Recovery

Public health nurses bring critical expertise to each phase of a disaster: mitigation, preparedness, response, and recovery. The practice of public health nursing is often more visible and better understood by the general public during the response and recovery phases, but their contribution is just as vital in the mitigation and preparedness phases, although probably underutilized. The increased involvement of public health nurses in disaster planning and response begins with their understanding of the comprehensive scope and standards of practice and follows with their striving to achieve individual competencies to better collaborate with others and contribute to emergency preparedness and response (Jakeway et al., 2008). [Table 32.12](#) shows the phases of the disaster management cycle and provides examples of the nurse's role in relation to the nursing process.

Disaster Phase	Assessment and Analysis	Planning	Implementation	Evaluation
Mitigation and Preparedness	<ul style="list-style-type: none"> • Assess the community for individuals and populations at risk during disaster. • Assess the community for hazard vulnerability and identify hazards that create the greatest risk. • Assess community design and available resources for potential locations for sheltering, routes for evacuation, and locations, transportation, and resources to hold and process mass casualties. 	<ul style="list-style-type: none"> • Develop a plan to address needs of populations at risk during a disaster. • Create a plan to minimize hazard vulnerability, especially in those areas identified as high risk. • Collaborate with community members to plan for sheltering, evacuation, and mass casualty needs during disaster. 	<ul style="list-style-type: none"> • Conduct tabletop exercises or simulations of the plan to address the needs of populations at risk. • Implement a plan to minimize hazard vulnerability, such as increasing security and monitoring high-risk areas. • Conduct exercises to practice the plan for sheltering, evacuation, and mass casualty events. 	<ul style="list-style-type: none"> • Evaluate the tabletop exercises or simulations, identifying strengths, areas for improvement, and need for additional resources. • Evaluate the plan to minimize hazard vulnerability. • Evaluate sheltering, evacuation, and mass casualty plans, identifying strengths, areas for improvement, and need for additional resources.

TABLE 32.12 Nursing Process Applied to Disaster Management (See Association of Public Health Nurses, 2014; Jakeway et al., 2008.)

Disaster Phase	Assessment and Analysis	Planning	Implementation	Evaluation
Response	<ul style="list-style-type: none"> • Triage victims of a disaster. • Assess for risk for communicable disease. • Assess for health care needs of the community and current resources for response. 	<ul style="list-style-type: none"> • Develop a plan for triage, treatment, and transport to health care facilities. • Develop a plan to provide mass vaccination to the community. • Schedule nurses and emergency response team to provide triage care throughout the community in shifts. 	<ul style="list-style-type: none"> • Triage, treat, and transport clients to health care facilities. • Conduct a mass vaccination clinic. • Provide response care to the community in shifts. 	<ul style="list-style-type: none"> • Evaluate the triage, treatment, and transport plan to identify strengths, need for resources, and areas for improvement. • Evaluate the plan for mass vaccination and revise as needed to increase the number vaccinated. • Evaluate the shift schedule and revise as needed to ensure the health care team is not overworked or overstressed.

TABLE 32.12 Nursing Process Applied to Disaster Management (See Association of Public Health Nurses, 2014; Jakeway et al., 2008.)

Disaster Phase	Assessment and Analysis	Planning	Implementation	Evaluation
Recovery	<ul style="list-style-type: none"> Assess the community for continued communicable disease risks. Assess the community and health care workers for mental health needs. 	<ul style="list-style-type: none"> Develop a plan to decrease communicable disease risks, such as education regarding food and water safety, eliminating standing water, and disposal of deceased animals. Collaborate with community mental health workers to develop a plan to provide mental health care to the community and health care workers. 	<ul style="list-style-type: none"> Provide education on disease risk and methods to decrease risk. Refer individuals to mental health providers. 	<ul style="list-style-type: none"> Evaluate the impact of the plan to decrease communicable disease risk. Evaluate the plan to provide mental health services, identifying the need for additional resources, strengths, and areas for improvement.

TABLE 32.12 Nursing Process Applied to Disaster Management (See Association of Public Health Nurses, 2014; Jakeway et al., 2008.)

Mass Casualty Triage Systems

Response to mass casualty events often involves more victims than responding caregivers, requiring responders to sort victims categorically based on the degree of injury. Triage during a mass casualty event is a dynamic process that requires disaster preparedness training. Medical responders to a mass casualty must triage victims differently than when caring for clients in a controlled setting, sorting victims based on severity of injury rather than treatment of injuries. This may seem counterintuitive to normal prehospital protocols. The goal of triage systems used in mass casualty events is to do the greatest good for the greatest number of people given limited available health care resources (Clarkson & Williams, 2023). Treatment during field triage is minimal, with the goal of moving clients away from the incident and toward resources that offer more comprehensive care. Victims should be reassessed and may be recategorized based on changes in their clinical status. The triage process should focus on clients' rapid assessment and quick movement (Clarkson & Williams, 2023).

There are several triage systems used worldwide. The algorithms are similar and have a tightly structured approach. The following sections discuss the most common triage systems.

START Triage

The Simple Triage And Rapid Treatment (START) method was developed in 1983 by Hoag Hospital and Newport Beach Fire Department staff in California for rescuers with basic first-aid skills. START is the most widely used triage system in the United States for mass casualty incidents (Clarkson & Williams, 2023). START assesses the victim's ability to obey commands, respiratory rate, and radial pulse or capillary refill.

The START triage system uses a color-coded tag method to categorize clients based on the severity of the injury and to guide transport. **Triage tags** allow responders to sort victims quickly and indicate the level of treatment needed

efficiently. These colors are universally recognized and correspond to a predetermined set of physical assessment findings, so responders have a standardized way to tag victims. Red indicates that the person has a life-threatening injury that requires immediate treatment; yellow indicates that the person has a serious injury that can tolerate delayed treatment, and green indicates that the person has minor injuries and is considered “walking wounded.” The color black is used for those already deceased or imminently expected to expire. [Figure 32.7](#) shows the decision tree for tagging victims based on assessment findings. Once victims are triaged and tagged, they should be moved to designated areas that serve as treatment and loading zones for transport to higher levels of care.

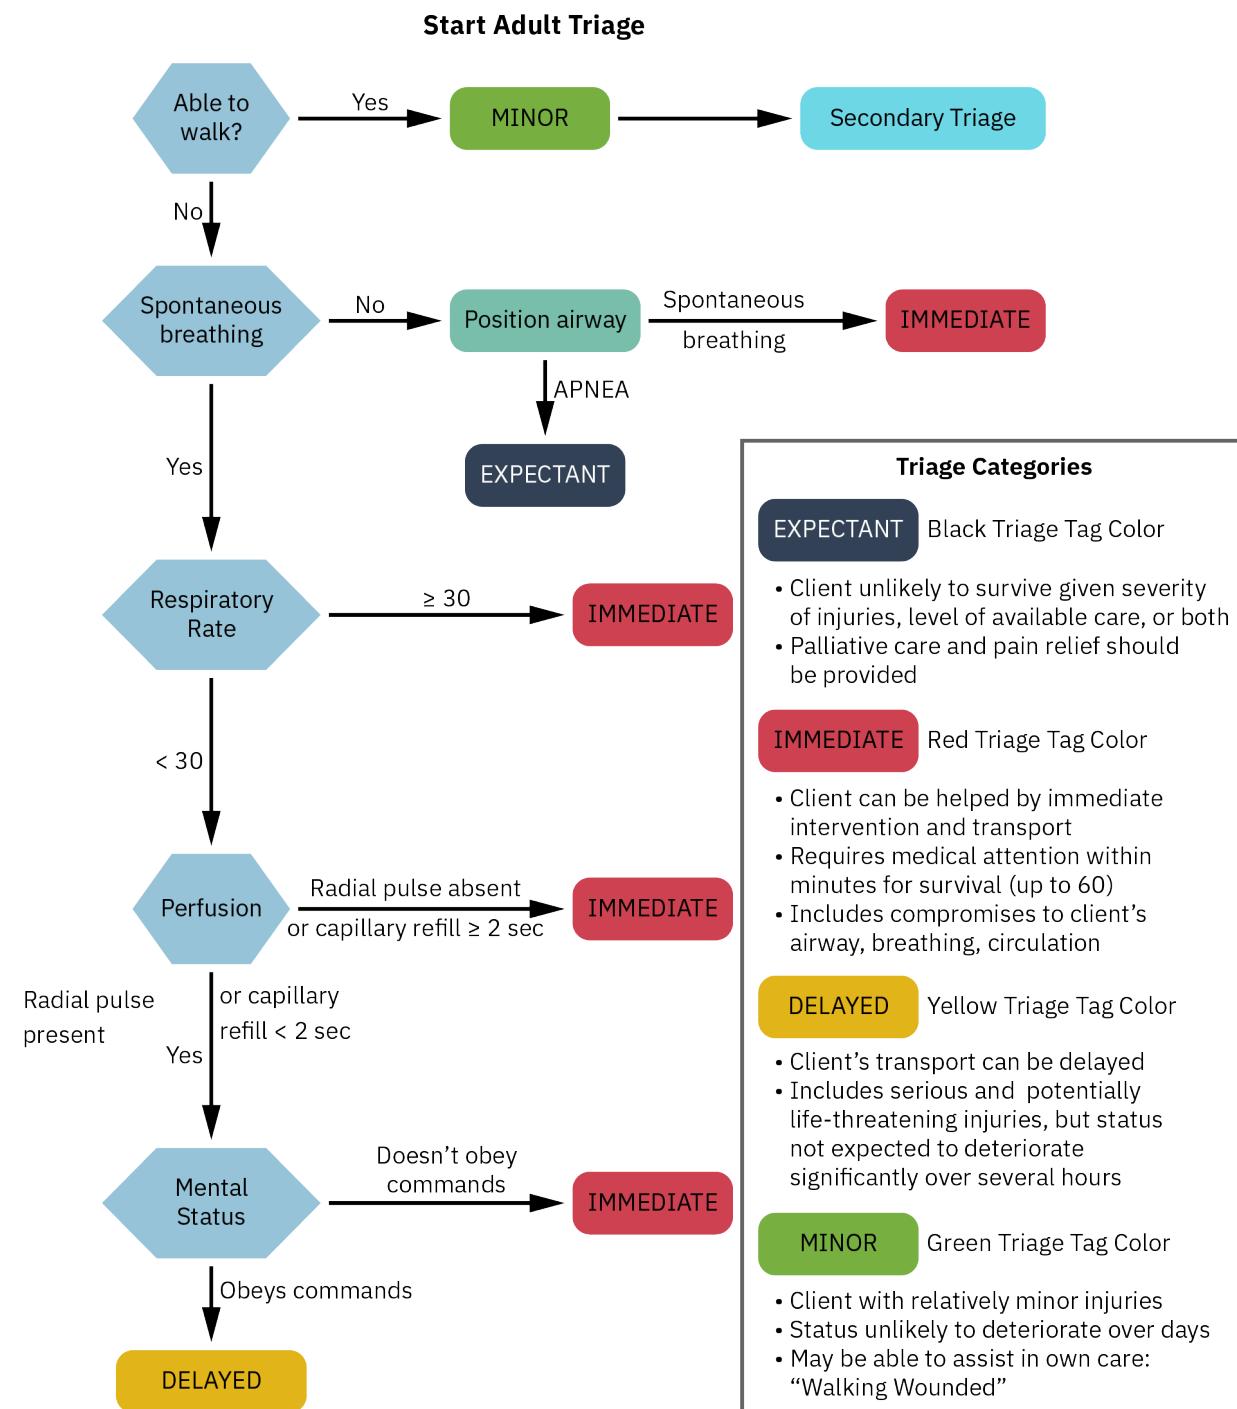

FIGURE 32.7 The START triage system uses a decision tree for tagging victims based on assessment findings. (See U.S. Department of Health and Human Services, 2023; attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

SALT Triage

The Sort, Assess, Life-saving Interventions, and Triage/treatment (SALT) system is similar to the START system;

however, it is more comprehensive and adds simple life-saving interventions during field triage (Clarkson & Williams, 2023).

- **SORT:** Sort the walking, waving, and still. The responder asks all victims at the scene to walk to a designated casualty collection area if possible and wave an arm or leg if they need help. Those who cannot move or follow commands should be assessed first.
- **ASSESSMENT:** Assessment and lifesaving interventions occur concurrently. Upon assessment of a victim with life-threatening injuries, the responder should intervene.
- **LIFE-SAVING INTERVENTIONS:** If not time-intensive, simple techniques such as controlling major hemorrhages, opening airways, needle decompression, and auto-injector antidotes should be performed. Once the intervention is performed, the responder should assign a color-coded tag similar to the START system and move on to the next victim.
- **TREATMENT AND TRANSPORT:** Once tagged, victims are moved to the designated casualty collection point for transport by emergency management services to higher levels of care.

START TRIAGE BASICS

[Access multimedia content \(<https://openstax.org/books/population-health/pages/32-5-the-nurses-role-in-emergency-preparedness-and-disaster-response>\)](https://openstax.org/books/population-health/pages/32-5-the-nurses-role-in-emergency-preparedness-and-disaster-response)

This video gives an overview of how the START Triage algorithm is used during field triage.

Watch the video, and then respond to the following questions.

1. How does the nurse provide rapid assessment using START triage?
2. How should the nurse tag a client who passes all tests? How should a nurse tag a client who fails one test?
3. What interventions do victims tagged as immediate receive?

JumpSTART

JumpSTART is a modification to the START system to assess and triage pediatric victims up to 8 years old. This method considers the difference in normal respiratory rates for children up to age 8. If the child's age is unknown, the responder should look for underarm hair in males or breast development in females as an indicator of adult age (Clarkson & Williams, 2022).

The differences in this algorithm include:

- If a child is apneic with a pulse, open the airway and provide five rescue breaths. If breathing resumes, tag them as immediate (red). If apnea continues after five rescue breaths, they are given an expectant (black) tag.
- Normal respiratory rates are more than 15 or less than 45. If respirations fall outside this range, tag them as immediate (red).
- Neurological assessment is performed using the mnemonic AVPU (alert, responds to verbal stimuli, responds to painful stimuli, and unresponsive). Victims with abnormal posturing to painful stimuli or who are unresponsive are assigned an immediate (red) tag designation.

UNFOLDING CASE STUDY

Part B: Disaster Management

Read the scenario, and then answer the questions that follow based on all the case information provided in the chapter thus far. This case study is a follow-up to Case Study Part A.

A major hurricane makes landfall in Juanita's community, causing widespread damage, loss of electricity, flooding, and mass injury. The community activates the hurricane disaster plan and mobilizes the emergency response team. Juanita is dispatched with the first wave of emergency responders to assist in client triage on-scene. She tags victims using the START method for adults and JumpSTART for children and provides lifesaving interventions to red-tagged victims prior to moving them for transport.

The following day Juanita works at a shelter receiving community members displaced from their homes. She finishes set-up of the temporary health center, organizes and tracks supplies, assesses community members as they enter the shelter, and provides interventions to prevent communicable disease such as setting up handwashing stations, monitoring for signs of infection, and providing clean clothing, food, and water.

- 3.** What action should Juanita complete prior to on-scene triage?
 - a. Confirm victim transport has arrived
 - b. Activate the Incident Command center
 - c. Ensure the scene is safe
 - d. Provide report to the emergency room

 - 4.** What finding will Juanita expect when assessing community members entering the shelter?
 - a. Malnutrition
 - b. Stress
 - c. Communicable disease
 - d. Confusion
-

Chapter Summary

32.1 Types of Disasters

All communities experience the risk for disasters. Disasters are classified as natural or human made. Natural disasters occur as a result of weather or a natural event. Human-made disasters occur as a result of human action. The health and safety of communities are directly impacted by disasters. Nurses contribute to the assessment of community disaster risk.

32.2 Biological Terrorism

Biological terrorism is the intentional release of biological agents to threaten populations and can lead to disaster and mass casualties. Biological agents are categorized by threat risk, with Category A as the highest priority agents that have the greatest threat of transmission and mortality. Nurses must be prepared to identify and respond to individual and community biological agent exposure.

32.3 Mass Violence

Mass violence is an intentional criminal act targeted at defenseless citizens with the intent to harm or kill in large numbers. Mass shootings make up the majority of mass violence events, with the number of incidences rising. Mass violence negatively impacts communities through loss of life, injury, decreased feelings of community safety, and increased mental health issues. Nurses must be prepared to recognize signs of

Key Terms

active shooter an individual (or individuals) who is killing or attempting to kill people with a firearm within an area

biological contamination occurs when infectious agents come into contact with a body surface, inanimate objects, or food or water supplies

biological decontamination mechanical, chemical, and physical methods used to reduce the number of microorganisms to a safe level following biological decontamination

biological terrorism the intentional release of biological agents into the atmosphere or environment to threaten a civilian population

disaster any occurrence that causes destruction or human injury or loss that overwhelms the community's available resources

disaster management cycle phases before and during an event designed to promote optimal health outcomes of the people; the four phases include mitigation, preparedness, response, and recovery

disaster simulation key individuals who would

potential violence and be able to respond to mass casualty events. Mass casualty management is complex and requires multiagency, interprofessional collaboration, efficient organization and communication, scene safety assessment, and zoning of care areas.

32.4 The Disaster Management Cycle

The disaster management cycle is a planned, systematic approach used by communities to prevent, prepare for, respond to, and recover from disasters. The nurse participates in every stage of disaster management. NIMS and ICS are used to promote multiagency, interprofessional collaboration and communication during an event.

32.5 The Nurse's Role in Emergency Preparedness and Disaster Response

Emergency preparedness is an essential role of the nurse. Upon completion of nursing school, attainment of disaster competencies for the general professional nurse is expected. Nurses involved in emergency response to disaster move through six stages of response and recovery. The nursing process is utilized during each phase of disaster management. Triage assessment is a vital nursing skill during disaster response. START, SALT, and JumpSTART are commonly used triage systems.

respond to a specific emergency simulate the disaster and respond as if the situation were real

environmental disaster the devastation of an area's ecological system that destroys wildlife and poses a significant threat to humans

flash flood caused by heavy or excessive rain falling over a short time span, often less than 6 hours

human-made disaster directly caused by actions of people that inflict devastation and destruction of human life

mass casualty incidents (MCIs) human-made or natural disasters that overwhelm the resources of local management agencies and the health care system

mass violence refers to incidents of intentional criminal acts targeted at defenseless citizens with the intent to harm or kill large numbers of victims

medical countermeasures (MCM) biologic products, drugs, and devices used to diagnose, prevent, protect from, or treat conditions associated with biological agents

mitigation an action to prevent or reduce the cause, impact, or consequences of a disaster

NA-TECH Natural Hazards Triggering Technological Accidents; human-made disaster resulting from technological accidents that are triggered by natural events

natural disaster disasters that arise from forces of nature, such as weather events (hurricanes, tornadoes, snowstorms, heat waves, and droughts), geological events (mudslides, floods, landslides, and avalanches), underground events (tsunamis, earthquakes, and volcanic eruptions), or epidemiological events (communicable disease outbreaks or swarms)

river flood caused when excessive rainfall or snowmelt forces a river to exceed capacity

social disasters human-made disasters that occur due to warfare, genocide, civil unrest, and terrorism

storm surge abnormal rise of water generated by a

storm, over and above the predicted astronomical tide

Strategic National Stockpile (SNS) supplies, medicines, and devices for lifesaving care that can be used in the short-term when the immediate supply of critical medical assets is unavailable or insufficient to meet the community's needs; part of the federal medical response infrastructure

tabletop exercise sessions where key individuals who would respond to a disaster discuss their role and response in specific emergency situations

technological disaster human-made disaster resulting from technological accidents that are triggered by natural events

triage tag standardized method used to sort victims quickly, indicate the level of treatment needed using tag colors that are universally recognized and correspond to a predetermined set of physical assessment findings

Review Questions

1. Which action would the nurse perform while engaged in the mitigation phase of disaster management?
 - a. Simulating the planned response to a hurricane event
 - b. Placing sandbags at a river's edge prior to flooding
 - c. Preparing a local school for temporary housing for flood victims
 - d. Completing a tabletop exercise to plan for flooding

2. Using the START triage system, which victim would the nurse triage as immediate or red during a disaster response?
 - a. A victim who is not breathing after two attempts to open the airway
 - b. A victim who has a broken arm and can obey commands
 - c. A victim who has multiple lacerations on extremities and chest
 - d. A victim who has a respiratory rate greater than 30 beats/minute with flail chest

3. The nurse is assessing the victims of a train derailment using the Sort, Assess, Life-saving Interventions, and Triage/treatment (SALT) system. Which action will the nurse take during the Sort phase of this triage system?
 - a. Moving victims who cannot walk to a staging area
 - b. Placing color-coded triage tags on victims
 - c. Opening the airway of victims who are not breathing
 - d. Asking victims to walk to a staging area

4. Using the six steps of disaster risk assessment to determine a community's hazard risk, which question would the nurse ask during step 3, vulnerability assessment?
 - a. Is the hazard risk high, moderate, or low?
 - b. Is the risk of disaster seasonal?
 - c. What are the estimated damages that would occur with the hazard?
 - d. What road might be impacted during the hazard?

5. Which characteristic of a Category A biological agent will guide the nurse's actions during an outbreak?
 - a. They have low mortality rates.
 - b. They are highly transmissible.
 - c. They are not a threat to the community.
 - d. They are difficult to disperse.

6. Which action would the nurse perform as Logistics Section Chief following the activation of the Incident Command System after a hurricane?
 - a. Provide boats for rescue from flooded areas
 - b. Set objectives for hurricane response
 - c. Create press releases regarding hurricane safety
 - d. Conduct missing persons investigations
7. The nurse is assessing a 6-year-old child at the scene of a school bus accident and notes that the child has a respiratory rate of 14 breaths/minute. Which color triage tag will the nurse assign to the child using the JumpSTART triage system?
 - a. Black
 - b. Green
 - c. Yellow
 - d. Red
8. Which action will the community health nurse take during the primary prevention stage of bioterrorism preparedness?
 - a. Participating in disaster simulations
 - b. Recognizing signs and symptoms of a bioterrorist attack
 - c. Immediately treating disease caused by a biologic agent
 - d. Responding to the psychological aftermath of the bioterrorism event
9. A community health nurse conducting a class for high school parents and teachers on mass violence would include which adolescent behavior as a warning sign for potential school violence?
 - a. Participation in class activities
 - b. Withdrawing from social interaction
 - c. Crying after failing an exam
 - d. Visiting the school counselor during lunch
10. Which activity would the community nurse perform during the recovery phase of the disaster management cycle?
 - a. Performing triage and emergency care
 - b. Educating families on disaster preparedness
 - c. Reducing the spread of communicable disease
 - d. Performing triage and transport victims to services

CHAPTER 33

Advocating for Population Health

FIGURE 33.1 Nurses can advocate for change in a number of ways, including by participating in public demonstrations. (credit: modification of work “AFGE Rallying with National Nurses United” by AFGE/Flickr, CC BY 2.0)

CHAPTER OUTLINE

33.1 The Importance of Nurse Advocacy

33.2 Advocacy in Population Health

33.3 Advocacy and Coalition Building

INTRODUCTION Pat, a public health nurse assigned to a diverse low-income metropolitan area, has been promoting health access for Black, Indigenous, and people of color (BIPOC) populations. Over the past year, the community has experienced a 15 percent rise in reported cases of intimate partner violence (IPV), especially among women of color in some of the most disadvantaged regions of the city. The city has launched an IPV prevention program in collaboration with the public health department, local police departments, and local domestic violence shelters. The program includes education, interventions, and additional follow-up services, including safe houses and social services. Pat’s role as a public health nurse includes oversight of public health education activities, with a goal of reducing incidents by 20 percent over the next 3 years through a federal grant.

Nurses must demonstrate professional accountability, acting in the best interests of their clients by supporting client rights and speaking on their behalf, if indicated. This support, or **advocacy**, is targeted toward improving the well-being of individuals and populations. The attributes of advocacy include empowerment, education, respect, protection, continuity of care, empathy, counseling, shielding, and whistleblowing (Davoodvand et al., 2016). Nurses advocate for their clients, coworkers, employees, and themselves to enhance the quality of care delivered. Nurse **advocates** often champion causes, such as disease awareness or other health issues, or they may advocate adopting high standards of nursing care or technology to improve their clients’ outcomes. Advocacy often involves providing public support for a particular cause or policy (Abbasinia et al., 2020). Nurses may advocate for a cause to

support an action or a proposal within a community or in the media, or they may serve as lobbyists by influencing public officials to promote the passage of legislation.

This chapter explains how nurses advocate for healthy persons, communities, and populations in promoting health equity. The legacy of nurses who have ignited positive changes in health care demonstrates nurses' bold impact on health care practices. Historical and current examples of nurse advocates in this chapter provide evidence of nursing's role in population health. Finally, the chapter identifies the steps in developing a coalition and provides examples of how nurses can become involved in advocating for the health of populations.

33.1 The Importance of Nurse Advocacy

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 33.1.1 Examine the role of advocacy in promoting change and advancing a cause.
- 33.1.2 Explain how nursing has historically been concerned with the social, emotional, and physical needs of people whose incomes are below the federal poverty threshold.
- 33.1.3 Describe how the nurse advocate can advance public health and promote health equity through targeted social determinants.

Nursing is by far the largest health care profession in the United States, with over 4.6 million practicing registered nurses and 203,000 new positions created each year (American Association of Colleges of Nursing [AACN], 2023). There are many more nurses than physicians in the United States, but nurses are underrepresented in public health advocacy issues. However, given that nurses have been recognized as the most trusted profession in the United States for the past two decades (American Nurses Association [ANA], 2023b), they are well positioned to advocate for and protect clients' civil rights, equality, health, and safety. Nurses are aware of the inequities in health care, especially among those most vulnerable. Nurses often translate health care to their clients and the public, as they possess the knowledge and skills to promote health using a compassionate approach to address health equity for all persons. Nurses educate clients on how to adapt their lifestyles to accommodate a host of health conditions. They effectively communicate the barriers to health in communities, coordinate effective health strategies, and educate persons and communities on methods to improve their health.

The Role of Nurse Advocates

Nurses can advocate for community-based changes that disrupt the barriers to equitable health care. According to the ANA (2023b), nurses advocate by promoting the rights, health, and safety of their clients. As advocates, nurses have historically championed a wide range of efforts to ensure that services, policies, and regulations meet the needs of individuals, families, and communities. Nurses promote justice, fairness, and equity in health care and address the social inequities that affect health. As discussed in [Social Determinants Affecting Health Outcomes](#), the social determinants of health (SDOH) are the conditions in which people are born, grow, live, work, and age (U.S. Department of Health & Human Services [HHS], 2020). These determinants often guide nursing practice and health policy development, as they overwhelmingly affect population health, well-being, and quality of life. The SDOH include access to safe housing, transportation, and neighborhoods; elimination of racism, discrimination, and violence; access to education, job opportunities, and adequate income; access to nutritious foods and physical activity; access to vaccinations and clean air and water; and elimination of linguistic barriers that limit literacy. For example, a family's access to grocery stores with quality fresh foods improves overall nutrition.

THEORY IN ACTION

Integrating the Social Determinants of Health into Nursing Practice

[Access multimedia content \(<https://openstax.org/books/population-health/pages/33-1-the-importance-of-nurse-advocacy>\)](https://openstax.org/books/population-health/pages/33-1-the-importance-of-nurse-advocacy)

In 2020, researchers measured the confidence of 768 Midwestern nurses in discussing the SDOH with their clients. In this study, nurses expressed that they were confident asking their clients about certain determinants of health, such as access to a primary health care provider (53.7 percent) and general access to health care (46.7 percent), but were less confident discussing income (50.4 percent), civic participation (48.8 percent), crime and

violence (39.1 percent), utilities (38.8 percent), and interprofessional violence (34.8 percent).

This ignited a call for enhanced skill development in SDOH interviewing to improve the working knowledge of the SDOH. This skill development improved the nurses' ability to advocate for their clients by establishing referrals for services that promote health access and delivery for their communities (Phillips et al., 2020).

In this video, Rear Admiral and Assistant Surgeon General Jonathan Mermin discusses why a focus on the SDOH improves health outcomes and promotes health equity.

Watch the video, and then respond to the following questions.

1. What are the pillars of the social determinants of health?
2. What wrap-around services would the nurse explore in order to improve health equity?
3. When providing care to a population, what factors outside of the health care system impact the ability to maintain health?

Nurses' ability to advocate for populations begins with an appropriate assessment. Several tools are available to identify the social determinants of health (Tiase et al., 2022), and although using this approach has shown some success (Buitron de la Vega et al., 2019), a universal approach to assessing the SDOH remains a challenge. In some areas, nurses now screen clients in primary care clinic settings and inpatient settings to determine what social barriers prevent them from maintaining or improving their health. This has led to an increase in community-based referrals and new roles for nurses as nurse navigators (Tiase et al., 2022).

The History of Nursing Advocacy

The history of nursing advocacy involves nurses advocating for client rights, well-being, dignity, and health care improvements. Nurses have historically leveraged their unique frontline position to drive positive change. Public health nurses have identified novel ways to protect children and vulnerable populations and continue to have a strong voice for social changes that promotes health. Today's nurses stand on the shoulders of nurses who have made history by creating positive changes in their communities. [Table 33.1](#) highlights a few of the many nursing leaders who have advocated for significant changes in public health.

Nursing Leaders	Changes for Which They Advocated
Florence Nightingale	<ul style="list-style-type: none"> • Collected and analyzed data on client outcomes to improve the health of the public • Influenced health policies and established a corps of nurses to tend to the soldiers during the Crimean war in the 1850s
Dorothea Dix	<ul style="list-style-type: none"> • An activist for mental health care and prison reform who exposed inhumane housing. • Petitioned the state legislature in Massachusetts in 1843 to finance training programs for nurses to expand mental health facilities • Advocated for the establishment of mental hospitals in Canada, England, and European countries
Mary Eliza Mahoney	<ul style="list-style-type: none"> • First Black nurse to graduate from a school of nursing, in 1879 • A passionate advocate for racial equality in nursing • Active in the women's suffrage movement • Cofounded the National Association of Colored Graduate Nurses
Sojourner Truth	<ul style="list-style-type: none"> • Born into slavery and escaped in 1826 with her newborn daughter • Worked to abolish slavery • Advocated for health and human rights for women and Black people • Advocated for policies to educate and train nurses

TABLE 33.1 Nurses Who Have Made History as Public Health Advocates

Nursing Leaders	Changes for Which They Advocated
Clara Barton	<ul style="list-style-type: none"> Orchestrated Civil War relief efforts Founded American Red Cross in 1881 Influenced national and international health policies
Lavinia Dock	<ul style="list-style-type: none"> Campaigned to ensure legislation for nurses rather than physicians to control the profession of nursing Protested for women's right to vote and was later jailed for attempting to vote Organized a nursing society in 1893 that later became the National League for Nursing
Lillian Wald	<ul style="list-style-type: none"> Recognized the intersection of social conditions and health Developed national and international health policy Developed the Children's Bureau in 1912
Mary Breckinridge	<ul style="list-style-type: none"> Developed rural health nursing practices Established the Frontier Nursing Service in 1925
Susie Walking Bear Yellowtail	<ul style="list-style-type: none"> First member of the Crow reservation to graduate from nursing school and become a registered nurse Improved health services for Native Americans, especially abuses to Native American women, such as nonconsensual sterilization of Crow women Established the Native American Nurses Association in the 1960s Known as the "Grandmother" of American Indian Nurses
Ruth Watson Lubic	<ul style="list-style-type: none"> Nurse midwife who developed the birthing center model of maternity care Opened the first birthing center in 1975

TABLE 33.1 Nurses Who Have Made History as Public Health Advocates

Nurses must address the social, emotional, and physical needs of people whose health needs are underrepresented. For example, in the 1960s, Loretta Ford witnessed that primary care in the underserved communities surrounding Denver, Colorado, was desperately lacking. Using innovative thinking, specialized instruction, and novel curriculum design, Ford launched the first nurse practitioner program in 1965. Today, the nurse practitioner model has become so successful in meeting the needs of clients, families, and communities that several advanced nursing programs and certifications have been created to address the social determinants of health at the master's and doctoral levels.

In the current state of health care, nurse practitioners, clinical nurse specialists, certified nurse anesthetists, and certified nurse midwives work in advanced practice clinical roles in community specialty practices such as pediatrics, maternal and family health, gerontology, mental health, and perioperative care and in a broad spectrum of institutional roles. Whether in a role as a registered nurse (RN) or an advanced practice registered nurse (APRN), every nurse has an opportunity and obligation to advocate for persons whose social, emotional, and physical needs are unmet and for persons with incomes below the federal poverty threshold in targeted social programs and strategies. However, the shortage of adequate health care professionals continues to be the most profound in rural areas in the United States as well as underserved communities and in care for older adults. The [Title VIII Nursing Workforce Reauthorization Act of 2019](https://openstax.org/r/congressgov) (<https://openstax.org/r/congressgov>) was developed and supported by nursing organizations to help meet the accelerating need for nurses to serve in these communities. The Title VIII act provides funding to support the education of nurses at the undergraduate and graduate levels for nurses planning to practice in these areas of greatest need. The U.S. House of Representatives passed this act in 2019, and it is currently with the Senate (Title VIII Nursing Workforce Reauthorization Act of 2019, 2019).

Nurse Advocacy: Theory and Attributes

The role of client advocate was first introduced into the code of ethics by the International Council of Nurses in the 1970s and was subsequently adopted into the code of ethics of other nursing organizations, such as the ANA (Abbasinia et al., 2020; Kalaitzidis & Jewell, 2020). The defining attributes of nurse advocacy include safeguarding,

appraising, valuing mediating, and championing social justice in health care (Abbasinia et al., 2020). To advocate for persons and populations, nurses safeguard their clients by preventing medical errors and calling out incompetency or misconduct by any health care team member. Appraising may involve providing clients with education about a diagnosis, treatment, or prognosis; identifying alternatives in a treatment plan and follow-up care; and maintaining privacy. Nurses must also maintain self-control in their communications with their clients by valuing clients' autonomy when making health care decisions and understanding their considerations related to values, culture, beliefs, and preferences. Nurses may serve as liaisons for clients and families by communicating individual preferences to other health care team members. Nurses often confront policies or rules that create inequities in the delivery of health care services or resources (Abbasinia et al., 2020). In the community setting, nurses may strengthen partnerships, develop or participate in community action efforts, and develop healthy public policies (Iriarte-Roteta et al., 2020).

As an example of the nurse's role as an advocate, consider LGBTQIA+ youth. Transgender and nonbinary youths are two to three times more likely to experience poor mental health outcomes such as depression, anxiety, and risk for suicidal ideation, suicide attempts, and self-harm than cisgender youth (Reisner et al., 2015). A report in 2021 revealed that when nurses provided educational workshops in health care facilities and schools on LGBTQIA+ topics (such as gender-affirming health care, inclusive sex education, sexual and gender diversity education, bullying, suicide prevention, safe spaces, and support groups), health inequities and discrimination in the health care system decreased (Medina-Martinez et al., 2021). Therefore, public health nurses can advocate for the LGBTQIA community by conducting mental health and substance use screenings and promoting a gender-affirming environment. Nurses should use appropriate pronouns and gender-affirming language and demonstrate compassionate listening without making assumptions. In a recent study of 104 transgender and nonbinary youth, the receipt of gender-affirming care, including puberty blockers and gender-affirming hormones, was associated with a 60 percent reduction in moderate or severe depression as well as a 73 percent reduction in suicidality over a 12-month follow-up period (Tordoff et al., 2022).

CONVERSATIONS ABOUT CULTURE

Why LGBTQIA+ Cultural Competence Matters

[Access multimedia content \(<https://openstax.org/books/population-health/pages/33-1-the-importance-of-nurse-advocacy>\)](https://openstax.org/books/population-health/pages/33-1-the-importance-of-nurse-advocacy)

In this video, Sarah Rosso, the executive director of the Hugh Lane Wellness Foundation and mental health advocate and ally, explains how LGBTQIA+ cultural competence supports clients' mental health.

Watch the video, and then respond to the following questions.

1. Why does Sarah advocate for LGBTQIA+ cultural competency training among the community partners and organizations that work with their organization?
2. How can communities reduce the impact of suicide on LGBTQIA+ youth?
3. As a new nurse, how would you approach the issue of gender dysphoria among the youth in your community?

33.2 Advocacy in Population Health

LEARNING OUTCOMES

By the end of this section, By the end of this section, you should be able to:

- 33.2.1 Describe how nurses can get involved in advocacy.
- 33.2.2 Engage in advocacy that fosters the best interest of the individual, community, population, and profession.
- 33.2.3 Demonstrate social responsibility as a global citizen who advocates for health equity for all.
- 33.2.4 Defend social justice and health equity, including addressing the health of vulnerable populations.
- 33.2.5 Identify evidence-based strategies to evaluate the efficacy of advocacy actions.

Compared to peer nations, the United States lags behind other countries in multiple health outcomes, especially in disparities in maternal and infant mortality, avoidable mortality, and chronic disease morbidity among at-risk

populations (Tikkanen & Abrams, 2020). Although the reasons for these lagging outcomes are multifold, the United States continues to struggle in the reduction of risk factors for diseases and conditions that are modifiable, including unhealthy eating behaviors; a lack of physical activity; alcohol, tobacco, and drug use; and the surge in overweight and obese children and adults who are overweight or obese. The inability to move the needle on modifiable health risks has led to an increase in chronic conditions, a shortened life expectancy, and mental health problems, especially among populations and communities that are most vulnerable (Centers for Disease Control and Prevention [CDC], 2022).

The critical importance of nursing advocacy to improve health was clear on the front lines during the COVID-19 pandemic. Nurses witnessed the health inequities and modifiable risk factors affecting their clients daily at the bedside and in at-risk communities. Nurses routinely cared for clients who experienced tragic health outcomes when they could not afford health care and medications. This section offers strategies for nurses to address systemic health care bias and discrimination in systems and institutions that result in poor health care. Examples in this chapter of nurses involved in advocacy highlight nurses who have pioneered basic health-promoting initiatives to reduce health care inequities and several strategies for nurses to become successful advocates.

Skills and Strategies in Advocacy

Advocating for others requires skills in collaboration, influence, communication, and problem-solving (ANA, 2023b). However, the first step of advocacy is to effectively understand the audience's needs and address public concerns and their impact on the target population through effective listening. As discussed in [Assessment, Analysis, and Diagnosis](#), nurse advocates must develop skills to assess communities that build respect, trust, and credibility with community partners affected by social or health issues. By understanding community concerns and building trusting relationships, nurses can influence community leaders, businesses, nonprofits, legislators, and grassroots efforts to promote health by ensuring access to clean water, food, shelter, sanitation, health equity, and access to health care. To effectively invoke change, nurses must bring not only their clients' stories but also data and facts that provide a visual image of humanity and ethics related to the issues at hand to public health agencies and politicians.

When initiating communication with community partners, it is essential to remain on point. Nurses should professionally and succinctly communicate key information regarding the issue within the first minute of a conversation. This requires preparing a brief, practiced discussion of the issue, including relevant statistics and perspectives from the community, ahead of time. The nurse should specify their role within the community and clearly identify any affiliated agency they represent. It is helpful to support this conversation with a one-page fact sheet containing relevant contact information, the key elements of the issue, the request in humanistic terms, and the impact of the problem at hand.

Getting Started in Advocacy

Today's nurses serve many roles to redesign health care and advocate for persons and populations. Many serve in communities directly, while others direct health care through appointed or elected government roles. [Table 33.2](#) showcases modern influential nurse leaders who are changing the face of public health through their service in important advocacy roles. Many nurse advocates believe in **social justice**, a view that everyone deserves equal economic opportunities and political and social rights.

Nursing Advocate	Major Accomplishments
Rear Admiral Sylvia Trent-Adams, PhD, RN, FAAN	<ul style="list-style-type: none"> • Deputy Surgeon General of the U.S. Public Health Service Commissioned Corps (2015–2019) • Principal Deputy Assistant Secretary for Health (2019–2020) • First Black woman to lead University of North Texas Health Science Center, Fort Worth, 2022 • Principal Deputy Assistant Secretary for Health (2019–2020) • In these roles, Trent-Adams has advocated for quality and safety in client care. She led the United States in creating the white paper <i>Framework for Effective Governance of Health System Quality</i> as a member of the board of directors of the Institute for Healthcare Improvement.
Linda Aiken, PhD, RN, FAAN, FRCN	<ul style="list-style-type: none"> • Leading world authority on the causes and consequences of nurse shortages in the United States and globally • Founding director of Penn Nursing Center for Health Outcomes and Policy Research that changed hospital policy in 30 countries • Research in improved care for clients with AIDS • Research in organizational culture, nurse burnout, and client satisfaction
Regina S. Cunningham, PhD, RN, FAAN	<ul style="list-style-type: none"> • Elected as a new member of National Academy of Medicine (NAM) in 2022 and became the chief operating officer for the Hospital of the University of Pennsylvania • Developed innovative professional roles and advanced care delivery models that have served as models for health care internationally
Lauren Underwood, MSN/MPH, RN, FAAN	<ul style="list-style-type: none"> • Nurse practitioner and the youngest Black woman to serve in the U.S. House of Representatives • The first millennial to represent her community in Congress; advocates for affordable health care by lowering health care insurance premiums for people with preexisting conditions and lowering drug prices
Margaret P. Moss, PhD, JD, RN, FAAN	<ul style="list-style-type: none"> • Elected as a new member of NAM in 2022; the only American Indian nurse with a PhD and JD • Professor and nursing director, First Nations House of Learning, University of British Columbia • Exceptional leadership in nursing and has led legislation to reduce inequities in indigenous health care; co-led the Indigenous Strategic Plan globally and published the first nursing text on American Indian health
Franklin Shaffer, EdD, RN, FAAN, FFNMRCI	<ul style="list-style-type: none"> • Fellow of the American Academy of Nursing (FAAN) and a member of the Fellowship of the Faculty of Nursing and Midwifery of the Royal College of Surgeons in Ireland (FFNMRCI) • Representative to the United Nations, World Health Organization, and the International Council of Nursing • Conducted extensive research on global health • Established the National Nursing Assessment Service to provide an assessment system to evaluate the credentials of nurses from foreign nursing schools that seek licensure within a province of Canada

TABLE 33.2 Influential Nurse Leaders of Today

Nursing Advocate	Major Accomplishments
Norma Martinez Rogers, PhD, RN, FAAN	<ul style="list-style-type: none"> Founded the International Association of Latino Nurse Faculty Past president of the National Association of Hispanic Nurses Engaged nursing students to participate in community-based primary care to advance public health Founding commissioner of the Medicaid and Children's Health Insurance Program (CHIP) Payment and Access Commission
Cori Bush, RN	<ul style="list-style-type: none"> The first Black woman and the first registered nurse to represent Missouri in the U.S. Congress As a Nonviolence 365 Ambassador with the King Center for Nonviolent Social Change, received the Hershel Walker Peace and Justice Award (2019) for her distinguished advocacy to secure housing and health care for all persons and continues to fight for reproductive rights for women

TABLE 33.2 Influential Nurse Leaders of Today

Although nurses are well positioned to support and advocate for those without a voice, many nurses either do not know how to become involved or feel they do not have the required competencies to effect change. One of the first steps in becoming an advocate is to become informed of the many issues affecting health care equity and the issues that impact the nursing profession. To become fully informed, nurses often connect with other nurses and nursing organizations and other organizations in the community, state, or nation about issues that matter. Nurses advocate for the profession by fostering new nurses at the bedside and in the community. Nurses who mentor, teach, or model professional nursing responsibilities for new nurses facilitate excellence in care for their clients. Nurses must also advocate for the profession whenever they are asked about their work, as the general public often does not understand their professional role (ANA, 2023b). Practicing a 30-second “elevator speech” on the nursing scope of practice can help new nurses be prepared to engage in advocacy for the profession of nursing in public forums.

Making the Case for Advocacy

Nurse advocacy is critical from a population health perspective. A change in life circumstances within a population can result in many unanticipated threats to public health. For example, the COVID-19 pandemic resulted in a loss of income and stability for millions of Americans. It also caused stress, power imbalances, dependency, and a loss of community and social support, triggering increased alcohol and drug use. These conditions stimulated a rise in domestic and intimate partner violence (IPV)—physical, emotional, and financial—in the home. Violence at home is a significant cost to society given the adverse physical and mental health outcomes that present because of the abuse. These negative outcomes include depression, post-traumatic stress disorder, risky sexual behaviors, and high rates of chronic disease (American Psychological Association [APA], 2020).

To make the case for advocacy, let’s use IPV and domestic violence (DV) as an example. One in every four women and one out of every seven men experiences IPV or DV, and 25 percent of children are exposed to DV during their childhood (APA, 2020; Huecker et al., 2023). Nurses as a population are disproportionately affected by IPV and DV. One study reported the prevalence of IPV among nursing students was 48.2 percent, and 58.7 percent for practicing nurses (Anikwe, et al., 2021). Among minority populations, such as Black and Native American people, the rates of abuse (40 percent) and resultant homicide are significantly higher than for White people and five times higher in families with low socioeconomic status (APA, 2020). Among the LGBTQIA+ community, the rate of IPV is disproportionately high (26 to 66 percent), and persons with disabilities have a much higher rate of IPV across their lifespan. IPV during college can lead to depression, low academic performance, substance misuse, a higher risk of dropping out, and, potentially, death (Seon et al., 2022). The social stigma of IPV among college students often limits reporting of these incidents. However, many universities have expanded support for victims of IPV using telehealth services or face-to-face counseling (Nelson et al., 2023). Counselors at one university noted a dramatic rise in IPV among students living on campus during the pandemic. Although students were seeking counseling, reporting these incidents to local police did not correlate with the rise in students seeking mental health services after rape. Test scores on standardized national exams dropped, and overall student retention rates at the university also dropped dramatically.

While the personal health, financial, and emotional consequences of IPV and DV are staggering, the estimated cost

to society in the United States due to injury, lost work, criminal justice, and other expenses is approximately \$3.6 trillion. While health care professionals are taught to screen for a history of IPV or DV, few programs exist to prevent these situations in the first place.

CASE REFLECTION

Intimate Partner Violence

Read the scenario, and then respond to the questions that follow.

Tracy is a 21-year-old nursing student living in a dormitory on her university's campus. Tracy had been doing well in school until last week, when she missed school for 4 days after being sexually and physically abused by her boyfriend, also a student on campus. Withdrawing to her dorm room, Tracy refused to seek treatment, leave her room, or report the incident. Because she missed two important exams, Tracy was given an academic warning for the first time in her life. Finally, Tracy's roommate convinced her to go to university health services where she met with Tonja, a registered nurse. Tracy told Tonja that she was afraid to walk alone on campus. She was also afraid her boyfriend would be expelled or blame her for ruining his life if she told the police what had happened.

1. What campus resources are available to prevent intimate partner violence on your college campus?
 2. How could the housing environment on campus affect a student's physical and mental health care and treatment following a sexual assault?
 3. How could a university health services registered nurse advocate to improve physical safety on college campuses?
 4. What type of programs could a nurse in university health services launch to prevent and/or better care for victims of intimate partner violence like Tracy on college campuses?
-

National Advocacy Organizations to Support Vulnerable Populations

The National Health Care for the Homeless Council (NHCCHC) is an example of an advocacy organization that partners with federal agencies such as the CDC to collect data on homelessness and has formed coalitions with schools, health centers, veterans' groups, and several organizations to strengthen current health programs. The NHCCHC connects health care professionals and individuals who are experiencing homelessness, provides health care and social services at over 200 homeless facilities, provides gateways to Medicaid insurance, seeks to reform the behavioral health system and the criminal justice system, and seeks to establish a universal health care plan and guarantee affordable housing by influencing health policy (NHCCHC, 2023). The impact of these coalitions is reported using dashboards that identify the numbers of individuals who are homeless and the health status and health care of this population, such as immunizations, various health screenings, and incidence of diseases such as asthma, diabetes, hypertension, and modifiable conditions such as cardiovascular diseases using a cost-benefit analysis. Nurses can use these databases to access important information that will support their advocacy efforts in communities at the CDC's [Data and Statistics \(<https://openstax.org/r/datastatistics>\)](https://openstax.org/r/datastatistics) site.

Activism: Many Ways to Engage in Advocacy Efforts

Nurses are often involved in developing standards of care and new policies locally in their place of employment through membership in their organization's committees and councils that address the quality and safety and satisfaction of client care activities. For example, nurses have developed standing orders in electronic health records to ensure clients in clinics or acute care receive their recommended vaccinations. Nurses also work to improve documentation quality by ensuring that screening tools identifying the social determinants of health are part of the intake interview in clinics, schools, and hospitals (Buitron de la Vega, 2019). These advocacy efforts are all examples of activism.

Nurses actively contribute to decisions about staffing, resource allocation, workflow design, equipment needs, and other resources nurses need at the point of care, which can directly affect safety and satisfaction. Nurses are increasingly involved in the culture and climate of their work environment. Advocating for a healthy work environment by eliminating acts of incivility also ensures client safety and improves the recruitment and retention of nurses.

A focus on safety in the workplace, such as strategies to prevent staff injury, has led to the advent of specialized lift devices to prevent back injury, which affects between 40 and 50 percent of nurses annually, and 80 percent of nurses may experience work-related back pain during their career (Tariq et al., 2023). Data support reduced back injuries in institutions where lift devices are employed. Nursing advocacy can also lead to positions of leadership. For example, Regina Cunningham is a nurse who has advocated for her clients throughout her career. One of her many advocacy initiatives included methods to reduce overcrowding in the emergency room setting. As a result of her continued efforts to improve client care, she has held accelerating leadership roles. These initiatives have led to prestigious opportunities, such as a fellowship in the American Academy of Nursing and the Executive Nurse Fellows, part of the Robert Wood Johnson Foundation. Cunningham has served as chief executive officer at the Hospital of the University of Pennsylvania since 2017. She is the principal investigator of an award from the National Cancer Institute to improve the accrual of clients in clinical trials (Penn Nursing, n.d.).

Nurses can become advocates in formal public health roles, including positions in public health departments at the national, state, or local government levels. Nurses also serve on **political action committees** (PACs), in coalitions, or as lobbyists. Nurses have provided expert testimony to support bills in Congress and supported campaigns for candidates seeking public office who support public health agendas. PACs are formed to generate and spend funds for particular political candidates that align with their agenda, with most representing business, labor, or ideological interests. Many federal government public health activities are managed through regulatory agencies like the Food and Drug Administration (FDA) and non-regulatory agencies like the CDC. Nurses can also advocate for public health through the uniformed services. The U.S. Public Health Service (USPHS) is one of the nation's uniformed services and commissions nurses and other health care professionals as officers. Employment opportunities are available at [Explore Opportunities \(<https://openstax.org/r/usphsgov>\)](https://openstax.org/r/usphsgov). Nurses in the USPHS work on the front lines of public health to carry out laws and regulations, fight disease and monitor the spread of disease, conduct epidemiological research, and care for persons in underserved communities in the United States and other countries. Other opportunities include working for one of the armed services, such as the Army National Guard ([Figure 33.2](#)).

FIGURE 33.2 Nurses and other health care professionals who serve in the USPHS or in one of the armed services may provide direct care to clients nationwide and around the world and advocate on their behalf. This photo shows a National Guard mobile testing strike team administering COVID-19 tests in Georgia. (credit: "Georgia National Guard" by Capt. Fred Dablemont/Flickr, CC BY 2.0)

Many nurses join a nursing or other professional organization that aligns with their specialty or nursing practice or as a way to network with others of the same culture, region, or country to collaborate and improve client care. There are more than 100 different professional nursing organizations throughout the United States. In a nursing organization, committees of expert nurses create state of the science guidelines, create coalitions, and build leadership skills. Joyce Newman Giger is a great example. Dr. Giger was the first Black person elected as a chair for

a school of nursing faculty executive committee within a university. In her over 200 publications, she provides strategies to enhance culturally appropriate care using her model for assessing cultural phenomena relevant to delivering culturally congruent care. Using her model, she identified physiologic predictors of heart disease among premenopausal Black women. She has authored a best-selling textbook used by nearly 500 nursing, medicine, and allied health schools. She has received multiple accolades for her advocacy and research (American Academy of Nursing, 2023).

Sharing stories is a great way to advocate for clients, families, and communities. Social media platforms are an emerging strategy to engage active involvement through a wide range of grassroots efforts, including getting involved in well-known organizations and coalitions. For example, the National Nurses March took place in May 2023, and over 199,000 nurses joined forces on Facebook's National Nurses March group to organize the event and to inform nurses about issues affecting nurses, such as fair wages and standing up to address structural racism and violence against health care workers.

UNFOLDING CASE STUDY

Part A: Advocating for the At-Risk Client

Read the scenario, and then answer the questions that follow.

A nurse working in a public health role in an urban community with a high rate of homelessness is assigned to assist 52-year-old Tanesha White. Tanesha lost her job at a local department store 4 months ago when her diabetes and hypertension caused her to miss work for nearly 2 weeks. Two months later, Tanesha lost her apartment when she was unable to pay her rent. She presented to the homeless clinic as she needed more insulin to treat her diabetes. Her clothes are worn, she wears ill-fitting shoes, and she states her right foot is sore. Tanesha's teeth show evidence of decay, she has a productive cough, and she has smoked a pack of cigarettes a day for many years. Tanesha shares that she has "never felt more down" and has been relying on alcohol to get through the tough days. She has difficulty finding food and relies on the food kitchen about three times a week. She does not have a consistent health care provider and is uninsured. She is living in her car and has lost contact with her daughter and son. She left her husband after he physically abused and sexually assaulted her 3 years ago and has had trouble trusting anyone. At present, she has no social or family support. Her temperature is 101.2°F, and her blood pressure is 178/94 mm Hg. Her blood sugar is 302 mg/dL.

1. Tanesha is clearly experiencing a multitude of problems. Of these, your immediate priority of care is managing her:
 - a. blood glucose
 - b. hypertension
 - c. respiratory status
 - d. mental health

 2. What agency or service would the public health nurse reach out to first in order to help clients like Tanesha?
 - a. The local homeless shelter
 - b. The area agency on aging
 - c. A social worker
 - d. An advanced practice nurse or physician
-

Addressing Health in Vulnerable Populations

Given the trust placed in nurses by the public and the indispensable services that nurses provide, combined with nursing skills of negotiation, communication, advocacy, and problem-solving, nurses are well-positioned to collaborate and offer expertise on public health issues. Nurse advocates in public health nursing may serve in many ways to protect the health of those most vulnerable. Many nurses who have made a national or global impact on improving care for vulnerable populations have been elected to become members of the **National Academy of Medicine** (NAM). This interdisciplinary, private nonprofit institution works outside of government agencies to provide objective advice to advocate for improved health equity by "advancing science, accelerating health equity,

and providing an independent, authoritative, and trusted advice nationally and globally” (NAM, 2023a). In 2021, the NAM published [The Future of Nursing Report 2020–2030](https://openstax.org/r/nationalacademies) (<https://openstax.org/r/nationalacademies>) describing its vision and goals for the nursing profession as they relate to public health and emerging health policies over the next decade. The overarching goals of the report are to (NAM, 2023b)

- attain high-quality, longer lives free of preventable disease, disability, injury, and premature death;
- achieve health equity, eliminate disparities, and improve the health of all groups;
- create social and physical environments that promote good health for all; and
- promote quality of life, healthy development, and healthy behaviors across all life stages.

There are challenges to creating a collective voice, especially when ideologies regarding health move outside of the purview of health care clinicians. The belief systems of the public and of elected politicians often shape health perspectives. Politicians must be keenly aware of a wide range of beliefs, as these will shape the controversies surrounding the adoption of a law. Political trends in the United States impact the evolution of health policy, and nursing coalitions advocate for clients and populations by either supporting or objecting to federal and state statutes.

THE HPV VACCINE | WHY PARENTS REALLY CHOOSE TO REFUSE

[Access multimedia content \(<https://openstax.org/books/population-health/pages/33-2-advocacy-in-population-health>\)](https://openstax.org/books/population-health/pages/33-2-advocacy-in-population-health)

Vaccine hesitancy is a delay in acceptance or refusal of vaccines despite their availability. Approximately 42.5 million Americans are infected with HPV, and 13 million Americans, including teens, become infected with HPV each year (CDC, 2023a). HPV is a sexually transmitted disease spread through direct skin-to-skin contact during vaginal or anal sex with someone who has the virus (CDC, 2023a). Approximately 12,000 women are diagnosed with HPV-related cancer, and 4,000 will die yearly from HPV-related cervical cancer. HPV has also been associated with other types of cancer in both men and women. Despite the wide availability of three HPV vaccines licensed by the FDA, HPV vaccination rates are suboptimal in the United States, and adolescents from medically underserved communities have the lowest vaccination rates (Tsui et al., 2023).

In this video, two researchers from Johns Hopkins University discuss their findings from a study of survey data to explore why some parents and caregivers choose not to immunize their children against HPV.

Watch the video, and then respond to the following questions.

1. What are common reasons parents choose not to vaccinate their children?
2. Why are fewer boys being vaccinated than girls?
3. How can community health and public health nurses advocate to improve HPV vaccination rates?

Nurse advocacy can also lead to political action. One of the most controversial politicized cases regarding public health care in U.S. history was decided by the Supreme Court: the regulation of abortion. In June 2022, the ANA offered harsh criticism of the Dobbs ruling that removed women’s rights to make personal decisions about their reproductive and sexual health (*Dobbs v. Jackson Women’s Health*). In its official statement, the ANA strongly denounced the overturning of *Roe v. Wade*: “ANA is deeply disappointed in the decision to upend Roe v. Wade, which we view as a legal protection of basic reproductive health rights and human rights,” said ANA Enterprise CEO Loressa Cole, DNP, MBA, RN, FAAN, NEA-BC (ANA, 2022). In the official ANA response to the ruling, nurses continued to advocate for the rights of women:

Nurses have an ethical obligation to safeguard the right to privacy for individuals, families, and communities, allowing for decision making that is based on full information without coercion. As the largest group of health care professionals, nurses have for decades assisted their clients with weighing the benefits, burdens, and available options, including the choice of no treatment, when discussing sexual health issues and pregnancy. ANA firmly believes that no nurse should be subject to punitive or judicial processes for upholding their ethical obligations to their clients and profession (ANA, 2022).

[Figure 33.3](#) highlights several landmark changes made to health law over time as perspectives and beliefs have changed and evolved. [Engagement in the Policy Development Process](#) provides details regarding how health policy

is developed and how nurses can be involved, whether involvement consists of contacting a state or national legislator, providing testimony regarding a specific bill, participating in policy boards, or serving in public office. Nurses can also learn more about how to influence policy by serving as an intern in the House or Senate. Internships are available in a variety of paid or volunteer roles. More information is available through the [Congressional Research Service](https://openstax.org/r/sgfasorg) (<https://openstax.org/r/sgfasorg>).

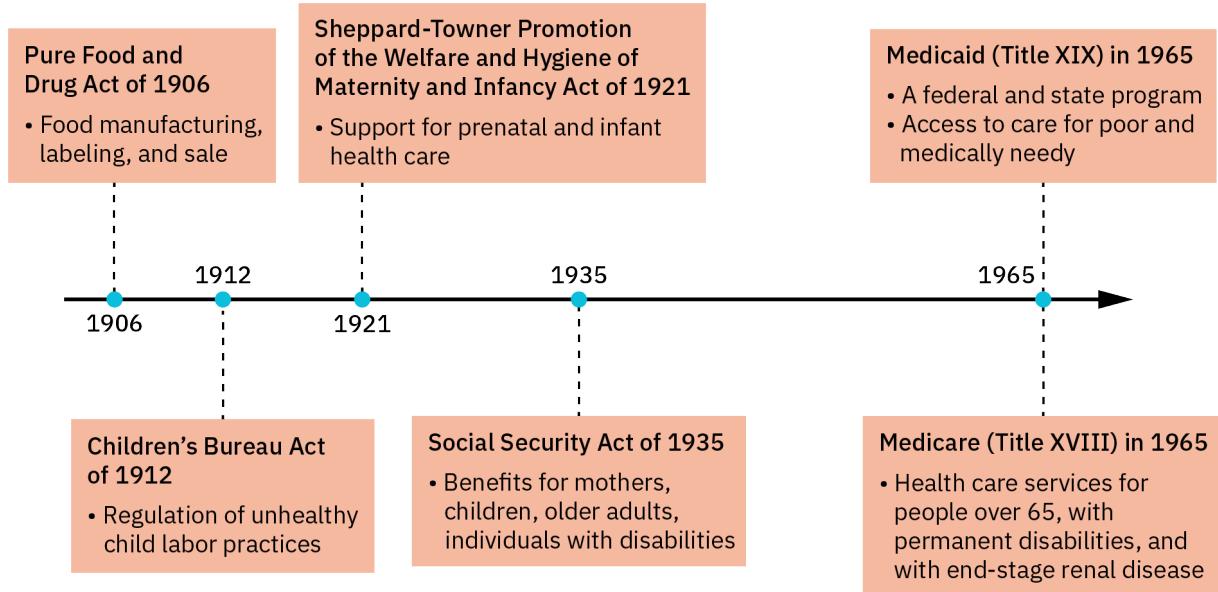

FIGURE 33.3 These landmark laws highlight the changes made to health law during the 20th century. (attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

Nurses as Global Advocates in Health Equity

Nurses advocate to change health policy at the global level as well. Nurses routinely see the inequities in health care around the world through various missions and international agencies such as the United Nations, the World Health Organization, and the **International Council of Nurses**. Members of the International Honor Society of Nursing ([Sigma](https://openstax.org/r/sigmanursing) (<https://openstax.org/r/sigmanursing>)) play an important role in health equity in each of these organizations as consultants and policy leaders and through the formation of global councils to address health inequities around the world. The [Nursing Now Challenge](https://openstax.org/r/nursingnowo) (<https://openstax.org/r/nursingnowo>) fosters nurses to develop international leadership skills by connecting with experienced nurse leaders and mentors in a global network in support of health for all (Sigma, 2023). Organized through Sigma, the United Nations provides free events each year that address nursing issues worldwide. Several organizations, such as the International Council of Nurses, and a wide range of nongovernmental organizations (NGOs) across the globe share the international health issues and programs created to improve health conditions. The most basic elements of public health, such as access to clean water, high rates of disease transmission, lack of access to medical care, health care for women, and infant mortality, are among the issues that continue to plague nations.

Global disparities in maternal and infant mortality continue to be higher among BIPOC populations. In June 2023, the untimely death of Tori Bowie, an Olympic athlete (and once the fastest woman runner in the world), during an at-home delivery at 8 months of pregnancy (Chappell, 2023) highlights the stark statistic that Black women are five times more likely to die from pregnancy-related cardiomyopathy and blood pressure disorders such as eclampsia than White women (MacDorman, et al., 2021). Nurses and nurse midwives can dramatically reduce disparities in maternal care for Black women worldwide by creating new models of care. In one example, the [Roots Community Birth Center](https://openstax.org/r/rootsbirthcenter) (<https://openstax.org/r/rootsbirthcenter>) in Minneapolis cares for a population of women and children that previously had one of the highest rates of preterm births in the United States. Owned and operated by an Black midwife, the center offers pre- and post-natal care to women of the community, tailored to the individual's culture and beliefs. Although challenged with inadequate reimbursement from Medicaid, the center advocates for longer-than-normal prenatal visits with a nurse midwife and nursing team, and the Roots Center has proven results: of the 284 families that have been cared for at the center over a 4-year period, there were no preterm births (Hardeman et al., 2020).

Advocacy in Action

The need for nurses continues to rise while at the same time the nursing shortage persists in the United States. Nursing universities struggle to expand enrollment while recognizing the shortage of nursing faculty. Safe staffing has become a legislative issue in many states. State-level nursing organizations provide ongoing updates about health concerns throughout the state and offer regular professional development conferences, updates on health care issues, and legislation that affects nursing care to clients and their families. For example, while a four-client-to-one-nurse ratio has been shown to be ideal to promote positive client outcomes in acute care medical-surgical hospital units, research shows that during the COVID-19 pandemic, an inability to provide this staffing level led to an increase in in-hospital mortality, length of stay, and 30-day readmissions (Lasater et al., 2021). Many state-level nursing organizations send regular updates to nurses about the issues that affect health care in the state and the nursing profession. There are no federal mandates for nursing staffing. California is the only state that has enacted laws to mandate nurse-to-client ratios, and several other states have enacted legislation to provide oversight of nursing staffing to promote client safety (CT, IL, MA, MN, NV, NJ, NY, OR, TX, and WA) (Dierkes, et al., 2022). In Connecticut, the State Nurses Association advocated for a law regarding safe nurse staffing that ensures safe client care throughout the state. As a result of these tireless efforts in the state's congress, the new law was signed by Governor Lamont in June 2023 (Connecticut Nurses Association, 2023).

Many lessons were learned regarding nurse-to-client ratios during the COVID-19 pandemic. During the pandemic, staffing levels in 116 hospitals in New York State were reviewed as related to Medicare claims data on 417,861 medical-surgical clients. In-hospital mortality, length of stay, and 30-day readmissions were compared to client-to-nurse staffing levels. Nursing staff ratios ranged from 4.2 to 7.6 clients per nurse. Researchers estimated that 1,595 lives could have been saved, as well as \$117 million, over the 2 years of this observational study if nursing ratios had remained at one nurse for every four clients, as the mortality rate increases by 16 percent for each additional client in the nurse's workload (Lasater et al., 2021). Additionally, in 2023, a universal nurse-to-client ratio of 1:2 in critical care was passed into law (New York State Nurses Association [NYSNA], 2023).

33.3 Advocacy and Coalition Building

LEARNING OUTCOMES:

By the end of this section, you should be able to:

- 33.3.1 Examine the benefits of uniting to create change.
- 33.3.2 Identify situations in which forming a coalition of groups and individuals would be beneficial.
- 33.3.3 Explain how to start a community coalition.
- 33.3.4 Describe the challenges and barriers to starting a community coalition.

A **coalition** is a group of people with shared vision or concerns, such as nurses or nursing associations and other groups that join forces to support a cause. Nurses may form coalitions to maximize resources to improve the chances of successfully achieving these goals. Coalitions may emerge from loose-knit networks of groups that are created to share resources and information. Coalitions may develop from groups formed by a task force, advisory committee, or commission. They may develop into a consortia, which consists of organizations with a particular goal. By creating a collective voice and sharing interprofessional expertise and resources, coalitions can have an impact on improving health outcomes by addressing inequities. To maximize their impact, coalitions require formal governance, strong leadership, participation, diversity, cohesiveness among the members, and collaboration with other agencies (Crowder et al., 2022).

The Essential Steps in Forming a Coalition

Coalitions can advance a cause more effectively than independent work as resources are shared and credibility is enhanced. This approach offers a more widespread reach than any single organization could achieve. For example, a parent-teacher association (PTA) is a coalition that may work toward improving student safety by requiring bike helmets for children riding their bikes to school. Members of this coalition may be from several organizations, such as retail stores, the department of public health, local government, parents, and others. These members may attend specific conferences or write letters to legislators and local news outlets to advocate for their cause. The cause's credibility is enhanced as the coalition may represent several organizations rather than a single special interest group. This dynamic often fosters trust and cooperation among several grassroots organizations.

The decision to form a coalition may be spontaneous or may be the result of a detailed analysis of a community's need ([Figure 33.4](#)). In some cases, receipt of a community-based grant may necessitate the formation of a coalition to fulfill the objectives specified in the grant award. The first step in deciding to form a coalition involves clarifying the objectives and appropriateness of the activities planned. A community assessment of the existing strengths and weaknesses is an essential element in forming a coalition as this identifies potential barriers and support systems in place, which guides the development of the best strategies to implement. An analysis of the strategy to employ must include the cost of the resources required. See [Assessment, Analysis, and Diagnosis](#) for more information on conducting a community assessment.

FIGURE 33.4 Community members in Laredo, Texas, participate in a community engagement event to discuss opportunities and challenges around food, nutrition, and health in Hispanic communities. Following such an event, community members may choose to form a coalition to focus on an identified issue. (credit: Ganjofarid Anvarzod/USDA/Flickr, Public Domain)

The coalition then decides how members are recruited, how many are needed, and what type of members are essential to meet the coalition's goals. While individual members may be recruited, existing member organizations may already be in place that are working toward a similar objective and may be willing to collaborate. Identifying competitors and adversaries who could impede the coalition's objectives is also important.

When forming a coalition, a leadership team is essential. It is often composed of a chairperson, facilitator, individual members, staff, a steering committee, a lead agency, and member organizations. While the chairperson is the organization's spokesperson, this individual is often responsible for signing letters, testifying in court, or serving in other roles to represent the coalition. The facilitator plays a key role as this individual will lead discussions and activities of the coalition and must possess the knowledge and skills of managing group dynamics. The facilitator will serve in a key role to resolve any disagreements, working in concert with the chairperson. The facilitator and chairperson may or may not be from the lead agency.

The coalition's activities will be developed, discussed, and defined at the meetings, conferences, or workshops by lead members of the coalition. The necessary resources will be identified in terms of the time commitment of the members and lead agency as well as financial considerations. Local service clubs and foundations may be essential in providing additional resources, and student trainees and volunteers may also support the coalition's activities.

The parameters of the membership agreement are critical to the organization's success and must be established and agreed upon. The location, frequency, and length of the meetings, as well as the members' expectations, is another important step when organizing membership. Also, there may be limitations to the duration of the coalition's existence. For example, the coalition's objective may be set to be achieved within 2 years, and a plan may be in place to disband the coalition when the objective has been met. Setting time limits for a coalition may help

members decide their involvement level.

The meeting structure and the method of making decisions should also be well communicated to all members. Members may also be expected to participate between structured meetings, and this commitment should be carefully outlined. After successfully forming the coalition, maintaining the energy and vision of the objective for each of the members requires skillful vision and attention to detail when problems arise. Leaders of the coalition must anticipate these difficulties, such as power sharing, group dynamics, individual disagreements, and the process for acceptance of new members.

Leaders must also actively engage steps to renew the objectives through ongoing education and training. Leaders will also embrace the challenge of bringing new issues to the group. An important step in maintaining a coalition is to focus on celebrating the group's successes, both large and small, and acknowledge key individuals who have gone above and beyond to support the cause. Evaluating the achievements will also lead to additional improvements in the strategies, enhancing the ability to continue moving forward. Evaluations may be formative (evaluating the process) and summative (evaluating the outcome).

Leaders and members of a coalition often serve to enhance visibility within a community to increase public awareness and influence the perception of the problem at hand. This may lead to additional organizations and individuals becoming interested in providing support. Lastly, while coalitions do not last forever, the mutual trust in relationships that are formed may last a lifetime, whether the objectives were met or not.

OTPC AWARDS THE NORTH TULSA COMMUNITY COALITION AS HEALTH COMMUNITY CHAMPIONS

Access multimedia content (<https://openstax.org/books/population-health/pages/33-3-advocacy-and-coalition-building>)

This video depicts how one community coalition was launched in Tulsa, Oklahoma, to address the social determinants of health.

Watch the video, and then respond to the following questions.

1. How did the idea for the North Tulsa Community Coalition begin?
2. What are the mission and goals of the North Tulsa Community Coalition?
3. What are some positive outcomes of this coalition?

Nurses and Coalitions

Many nurses hesitate to become involved in coalitions to support public health causes until they or someone they care about is personally affected by structural inequities in health care. Sometimes, a university professor or a client may have inspired one's interest in activism. Faculty in academic settings and nurse educators within the practice environment teach students and new nurses about safety and civility. They can ignite an interest in advocacy through mentoring and role modeling. In many ways, nurse educators are responsible for forming the professional identity of novice nurses to further the profession in an ever-changing health care environment (ANA, 2023a).

The ANA has developed a nursing advocacy coalition called RNaction that is available to help nurses act in groups on important issues in the United States that affect persons, nurses, and public health (ANA, 2023a). The **Campaign for Action** is another example of a coalition that has brought nurses, health care providers, consumers, educators, and businesses in almost every state together to ensure the health of all people by strengthening nursing (Campaign for Action, 2023). These state-level action coalitions build on the Future of Nursing Report to unite schools, fire and emergency services, and local businesses, clubs, and social justice organizations such as the Robert Wood Johnson Foundation to promote healthy communities by transforming health care. As a result of the Campaign for Action coalition, significant work is being conducted at the state level to address issues that impact health as a result of nursing care, such as access to health care, transforming nursing education, fostering interprofessional collaboration, the need for diversity in the nursing profession, and building healthy communities (Campaign for Action, 2023). For example, in 2022, 26 states improved access to health care by adopting full practice authority for all APRNs so they can practice to the full extent of their education and training. Several local and statewide programs have been launched to increase diversity in the nursing workforce due to this coalition. In Brandywine, Delaware, as part of the 2021 Nursing Innovations Fund project, the school district piloted an afterschool program

called BSD's Lifesavers to increase the awareness of nursing as a career to communities that are underrepresented in the nursing workforce (Campaign for Action, 2022). The program's success will be measured by identifying the percentage of participants pursuing a career in nursing.

CAMPAIGN FOR ACTION

The Future of Nursing: Campaign for Action, funded by the AARP Foundation, AARP, and the Robert Wood Johnson Foundation, collaborates nationally with nurses and other health care professionals, consumers, educators, and industry to improve health and health equity by strengthening nursing. The Campaign has action coalitions in every U.S. state.

Visit the [Campaign for Action \(<https://openstax.org/r/campaignforaction>\)](https://openstax.org/r/campaignforaction) website, scroll to the bottom of the page, select your state or another state of interest, and read about the latest news from that state's coalition. Then respond to the following questions.

1. Which state did you select?
2. What current actions is that state taking to increase health equity for its communities?

Nurses also advocate for health care of populations by seeking appointments or elected positions on various trustee boards for businesses and organizations that impact health care, whether in nursing, business, or education. The Nurses on Boards Coalition (NOBC) was formed in 2014 in response to the 2011 Future of Nursing Report, which called for nurses to lead change and advance health (Institute of Medicine, 2011). The NOBC collaborates with its member associations, partners in health care, and businesses to provide nursing leadership as members on the boards of directors for over 10,000 organizations (NOBC, 2021). Nurses interested in serving on boards may register on the [Nurses on Boards Coalition \(<https://openstax.org/r/nursesonboardscoalition>\)](https://openstax.org/r/nursesonboardscoalition) website to find an organization that matches their skills and expertise or seek resources to build leadership skills. Many national organizations such as specialty nursing organizations have local chapters. Becoming a local chapter member is a great way to stay up to date on the latest science and network with other nurses with similar interests. Leadership opportunities often become available within a specialty organization, and most are elected positions. The Nursing on Boards Coalition offers web-based and one-on-one advisement with a mentor to develop the skills to gain leadership skills and build to higher-level positions in these or other organizations congruent with an area of interest to advocate for populations of clients and nurses.

UNFOLDING CASE STUDY

Part B: Advocating for the At-Risk Client

Read the following scenario, and then answer the questions that follow based on all the case information provided in the chapter thus far. This case study is a follow-up to Case Study Part A.

Tanesha has been staying at the homeless shelter for the past 2 days. She was placed on antibiotics for lower lobe pneumonia, and her blood glucose level and blood pressure have stabilized. She has been able to shower and obtain shoes that fit her feet. She has a small diabetic ulcer at the base of her right great toe that has been cleaned and bandaged. Her car was moved to a safe place in the parking lot. She expresses concern about staying in the shelter; she fears that she will be assaulted and will be unable to protect herself as men have been seen sneaking into the women's ward. She said that she left home because she was assaulted and admits that she still feels afraid. She mentioned that she couldn't sleep well at the shelter because babies were crying all night. She said that she plans to return to her car to live soon if the conditions do not improve in the shelter.

3. What would the nurse consider a priority for clients like Tanesha?
 - a. Suicide precautions
 - b. Mental health evaluation
 - c. Nutritional assessment
 - d. Sleep assessment

4. What health policies might the nurse advocate for to best serve homeless individuals like Tanesha?
- Early childhood health education
 - Safe housing programs for families with children
 - Free mental health screening for veterans
 - Education on how to access health care

Student Involvement in Coalitions

Universities have historically been centers for igniting social changes that improve health. At one college of nursing, senior-level nursing students were concerned about the lack of a mandate for the COVID-19 vaccination in the workplace. Under the direction of their public health faculty member, more than 100 students formed a coalition. They wrote letters to their respective legislators with their concerns, which launched a wide range discussion in the state, resulting in a meeting to discuss the issue with the state's health commissioner. The box below shows an example of the letter the students developed. Student nurses have many avenues to become involved in advocating for the health of the communities they serve.

SAMPLE LETTER FROM NURSING COALITION TO LEGISLATOR

Date

Name/affiliation/contact info

The Honorable _____

Dear State Senator _____

My name is_____, and I reside at_____. I am currently a nursing student at ____ University, in (town), (State). I am writing to you in hopes that you will support our stance on the recommendation to endorse a mandate on the COVID-19 vaccination in the workplace. According to the CDC's reported data about the state of ____, "95% of the state's total population has received at least one vaccine dose, 83% are fully vaccinated and only 24.4% have the latest bivalent booster" (*cite*). In examining this data, most residents in our state are hesitant toward receiving a COVID-19 booster. As we move away from the height of the pandemic and into the future, it is necessary that action is taken to prevent any loss of progress. COVID-19 vaccines have been proven to fight against the virus and prevent hospitalizations. The CDC adds that moreover, "public health experts see reduced protection over time against mild and moderate disease, especially among certain populations. For the best protection, everyone 6 months and older is recommended to stay up to date with their COVID-19 vaccines, which includes getting boosters (CDC, ____)."

If the COVID-19 vaccination were to be mandated within the workplace, we would see an upward trend in (state_) residents staying up to date with CDC recommendations, which would influence others to follow suit. In addition, the workplace specifically must be accounted for as a place for greater risk of COVID-19 spread. Individuals working together in close quarters for many hours each week provides a breeding ground for infection spread. Studies have shown that "many private-sector employers want their employees to be vaccinated against COVID-19 to prevent the spread of the virus, reassure employees and customers that the premises are safe, avoid potential liability for transmission of the virus, and advance public health" (Rothstein et al., 2021, p. 1062). A mandate in the workplace would promote adequate protection of the individuals of (state). By keeping in line with the CDC recommendations, we can continue to move away from some of the darkest times in our world's history. Prevention is our biggest strength in continuing to fight against COVID-19. A mandate would only further promote this. This is a prevalent and dire time in our nation's history. With proper legislation, we can continue to move forward and keep on track for a healthy environment for all.

Thank you for your time and for considering this request.

Sincerely,

Name

RAY AND NICHOLAS SHARE THEIR STORY ABOUT WHY #CARECANTWAIT

[Access multimedia content \(<https://openstax.org/books/population-health/pages/33-3-advocacy-and-coalition-building>\)](https://openstax.org/books/population-health/pages/33-3-advocacy-and-coalition-building)

In this video, a father and son discuss the challenges of finding full-time support professionals to assist Nicholas, who has autism, intellectual disabilities, and several health issues. Visit [The Arc \(<https://openstax.org/r/thearcorgc>\)](https://openstax.org/r/thearcorgc) website to learn about family perspectives regarding medically complex and fragile children.

Watch the video, review the website, and then respond to the following questions.

1. What are the financial and career challenges that parents of medically complex children face?
2. How does Medicaid support families of children that are medically complex?
3. How can nurses advocate to protect children that are ventilator dependent or have other medically complex needs?

Chapter Summary

33.1 The Importance of Nurse Advocacy

Nurses have an ethical responsibility to advocate for change to support populations most at risk for inequities. Nurse advocates work to address the social determinants of health that create health disparities among populations. The nursing profession can act to reduce disparities and advance health through advocacy at many levels.

33.2 Advocacy in Population Health

Nurse advocacy involves assessment, collaboration, and communication. To be effective advocates, nurses must seek information to be fully informed about the issues affecting the populations they serve. Nurses can act locally, regionally, nationally, or globally to advocate for changes that will improve the health of

Key Terms

advocacy an act of support on behalf of another for a cause that improves health for persons and/or populations

advocate a person who champions causes, such as disease awareness or other health issues

Campaign for Action a coalition of nurses dedicated to transforming health and health care by nurses in collaboration with consumers, educators, and businesses in the United States

coalition a group of people with shared vision or concerns such as nurses or nursing associations and other groups that join forces to support a cause

International Council of Nurses (ICN) a federation of more than 130 national nurses' associations that works to ensure quality nursing care for all, sound health policies globally, the advancement of nursing knowledge, and the presence worldwide of a respected nursing profession and a competent and satisfied nursing workforce

National Academy of Medicine (NAM) an independent scientific advisory organization formed

communities and populations. The 2021 Future of Nursing report provides guidance regarding the priorities of nursing as it relates to community-based health care.

33.3 Advocacy and Coalition Building

Nursing coalitions can be more effective than individual advocacy. They enable members to share expertise and resources, and they lend credibility to issues of concern. Prominent national and state organizations have developed nursing advocacy coalitions, and many national coalitions have local chapters where nurses can become involved. Colleges and universities provide avenues for student nurses to participate in advocacy efforts.

in 1970 that aims to improve health for all by advancing science and health equity and providing independent, authoritative, and trusted advice on a national and global platform

political action committee (PAC) a political committee organized for the purpose of raising and spending money to elect and defeat candidates

social justice a view that each person deserves equal economic opportunities as well as political and social rights

Title VIII Nursing Workforce Reauthorization Act

the bill that reauthorizes loan repayment and scholarships for nurses, loans for nursing faculty development, advanced education nursing grants, grants for increasing nursing workforce diversity and nurse education, practice, quality, and retention grants

vaccine hesitancy a delay in acceptance of or refusal of vaccines despite the availability of vaccine services

Review Questions

1. Which activity would a nurse mentor recommend to a new nurse to begin to advocate for the profession?
 - a. Lobby for health care reform to cover preventive services
 - b. Educate families about the scope of nursing practice
 - c. Serve as a volunteer for a state legislator's campaign
 - d. Set up a flu shot clinic at a neighborhood church

2. Which information would the nurse provide to a state legislator about the need for safe staffing ratios in hospitals?
 - a. A six-client-to-one nurse ratio on a medical-surgical unit is ideal for positive client outcomes.

- b. Inadequate client-nurse ratios increased mortality during the COVID-19 pandemic.
 - c. Client-to-nurse staffing ratios do not adversely affect client outcomes.
 - d. Safe staffing ratios should be set by each hospital.
3. Which communication skill should the nurse use when preparing to meet with community partners about the need for increased health access for vulnerable populations?
- a. Concisely present key issues within the first minute
 - b. Prepare an in-depth, detailed speech
 - c. Provide a multipage fact sheet to support the conversation
 - d. Present facts and avoid using client stories
4. Which concept should the nurse consider when providing maternal-child health care to immigrants who have newly arrived in the United States from various countries around the world?
- a. The rate of infant mortality is consistent around the world.
 - b. Deaths from eclampsia are lower in Black women than White women.
 - c. Black women are more likely to die from pregnancy-related cardiomyopathy.
 - d. Global disparities in maternal-child deaths cannot be changed.
5. The community health nurse has formed a coalition to provide programming and safe meeting spaces for adolescents after school. Which statement best describes the nurse's purpose for forming a coalition?
- a. The nurse does not have the time to create this program without help.
 - b. There will be shared blame if the program fails.
 - c. The nurse does not possess the skills to develop such a program without help.
 - d. Resources are shared to increase the likelihood of achieving success.
6. Which goal would a nurse utilize when developing a program to improve care for vulnerable populations based on the Future of Nursing Report 2020–2030?
- a. Provide scholarships for student nurses to improve diversity
 - b. Increase the number and quality of shelters for the homeless
 - c. Improve quality of life and prevent disease, injury, disability, and premature death
 - d. Increase clinical hours for nurses obtaining advanced degrees
7. A nurse has joined a political action committee (PAC) through the state nursing organization. The nurse explains to community health nursing colleagues that the PAC performs which of the following functions?
- a. Making political contributions
 - b. Conducting judicial reviews
 - c. Identifying issues of concern
 - d. Lobbying government officials
8. Which of the following is a reason why a nurse might contact the Nurses on Boards Coalition (NOBC)?
- a. To get help in contacting their senator on a health care bill
 - b. To develop specialized clinical skills
 - c. To gain leadership skills in advocacy
 - d. To obtain funds for a new community hiking trail
9. To meet the health care needs of a community, a public health nurse has been asked to join a coalition. Which characteristic of a coalition should the nurse anticipate?
- a. An informal group that disbands when its goal is met
 - b. A social group set up for networking
 - c. A group that focuses on a specific nursing specialty
 - d. A formal group with clearly defined positions
10. As a member of the Campaign for Action coalition, in which activity would the public health nurse participate?

- a. Developing community walking trails
- b. Working at the state level to attract diverse students to nursing
- c. Lobbying at the state level for Medicaid expansion
- d. Collaborating with the CDC to promote vaccine education

CHAPTER 34

Engagement in the Policy Development Process

FIGURE 34.1 Policies shape health behavior, such as a policy encouraging New Yorkers to wear masks when using public transit to prevent the spread of the coronavirus disease during the COVID-19 pandemic. (credit: modification of work “MTA Announces \$50 Fine for Refusal to Wear a Mask on Public Transit” by Marc A. Hermann/MTA New York City Transit/Flickr, CC BY 2.0)

CHAPTER OUTLINE

- 34.1 Social Planning and Policy Change
- 34.2 Why Are Nurses Key Players in Health Policy?
- 34.3 Policy Development
- 34.4 Advancing Health Care Policies

INTRODUCTION After recently graduating from nursing school, Alex works with the tuberculosis (TB) group in the health department of a large metropolitan county. Alex’s group performs screening tests for clients with known TB risks or exposures and offers treatment to clients who are diagnosed with TB. While some clients seeking TB screenings are walk-ins, the majority have been referred to the health department by their health care providers. During their orientation to the TB group, Alex learned that state public health policies mandate the reporting of active and latent tuberculosis to the health department. Alex discovers that both health policies and laws are involved in mandatory disease reporting for a variety of communicable diseases and decides to learn more about these rules and how they vary from state to state. Alex learns that nurses are involved with health policy at all levels, from workplace institutional policies to regulatory policies and laws at the state and federal levels.

This chapter explores how and why health policies are made and how nurses can be involved in their creation and revision. It also periodically revisits Alex’s work as a nurse in the health department in relation to policy discussions.

34.1 Social Planning and Policy Change

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 34.1.1 Describe the differences between policy and law.
- 34.1.2 Describe how cultural beliefs and values impact both individual and community responses to health policy.
- 34.1.3 Explain how policies can interrupt the cycle of poverty, disadvantage, and poor health.

Nurses encounter many different types of policies daily. **Policy** is a term that can take on slightly different meanings depending on the context in which it is used. In its broadest sense, a policy is a relatively stable, deliberate course of action that evolves over time to deal with a specific problem or concern. The terms *law* and *policy* are often used interchangeably because they overlap, but they are two separate and necessary parts of social health planning.

Laws are created and enacted by the government and carry an aspect of punishment. Laws are the system of rules by which a country or community regulates the behavior and actions of its members. Policies are created by and for the people affected by them. An example of the difference between the two would be that attempting to practice nursing without a license is a violation of the *laws* regulating professional nursing, but if a nurse works in a critical care area, they may be required to earn and maintain a certification in critical care nursing to comply with a facility employment *policy*.

WHAT IS POLICY?

[Access multimedia content \(<https://openstax.org/books/population-health/pages/34-1-social-planning-and-policy-change>\)](https://openstax.org/books/population-health/pages/34-1-social-planning-and-policy-change)

This video defines policy, explains how it differs from law, and describes some aspects of policy development.

Watch the video, and then respond to the following questions.

1. How would you define *policy* in your own words?
2. How are policies and laws different?
3. Name three examples of health policies.

When local, state, or national regulations are passed, they are called **public policy** (Columbia University, 2023).

Public policies aimed at improving the nation's health include regulating highway speed limits to lower the incidence of traffic-related deaths and requiring municipal water systems to fluoridate water to improve oral health outcomes.

Health policies describe a health goal and a way to accomplish it, such as a mandatory quarantine to lower the spread of infectious disease, as occurred during the COVID-19 pandemic. **Social policy** covers those policy decisions that promote the public's general welfare, such as a minimum age to purchase tobacco. **Nursing policy** sets goals and boundaries for nursing practice, such as setting the minimum qualifications necessary to obtain and keep a nursing license, and finally, **institutional policies** are rules that an organization has developed to govern the activities of anyone employed by or associated with the institution. An example is a hospital policy that requires nurses to be checked off before drawing arterial blood gas (ABG) samples. Understanding how policies are created and implemented allows nurses to address issues in the communities in which they live and work and to improve health outcomes for the nation (Brokaw, 2016).

HEALTHY PEOPLE 2030

Health Policy

Many Healthy People 2030 objectives relate to improving individuals' health, safety, and well-being across all age groups and demographics. The objectives related to [Health Policy \(<https://openstax.org/r/healthgovhealthype>\)](https://openstax.org/r/healthgovhealthype) highlight the importance of collecting population-level health data on environmental health risk factors, reducing oral decay, and working toward tobacco cessation. Evidence-based resources are available to use in developing policies and programs that are effective, reproducible, and sustainable.

Cultural Influences on Health Policy Development

Health policymaking refers to the work of government bodies and other relevant organizations to formulate and establish policies and implementation methods to address any of the varied aspects of health care, which include public health and the health care system. It involves carefully thought-out decision-making processes to establish goals and priorities, fund the planned policy, and make plans for the policy's eventual implementation (Smith, 2020).

Health policy developers need to be sensitive to differences between their own cultural backgrounds and those of the prospective populations the policies will impact. Culture, religion, and ethnicity may influence beliefs and values that people have about health and health care. It is important to consider these beliefs and values when attempting to create new policy, whether for a single hospital department or for the whole nation. Researching and understanding the customs and values of a group before drafting a policy is a good start. Working with leaders from within a cultural group to establish the concerns and needs of the group demonstrates support and respect. Each ethnic group brings its own perspectives and values to the health care system, and some of these beliefs and practices differ from those of the traditional American health care culture.

Poverty and Health Inequality

The federal government creates and sponsors many policies and programs intended to improve the health of the population of the United States as a whole. Past programs include those designed to find employment for individuals left destitute by the Great Depression, such as the Works Progress Administration (WPA) of the 1930s ([Figure 34.2](#)). While not designed to improve health status alone, the WPA program and many similar programs allowed individuals and families to afford shelter and food in a time of economic turmoil.

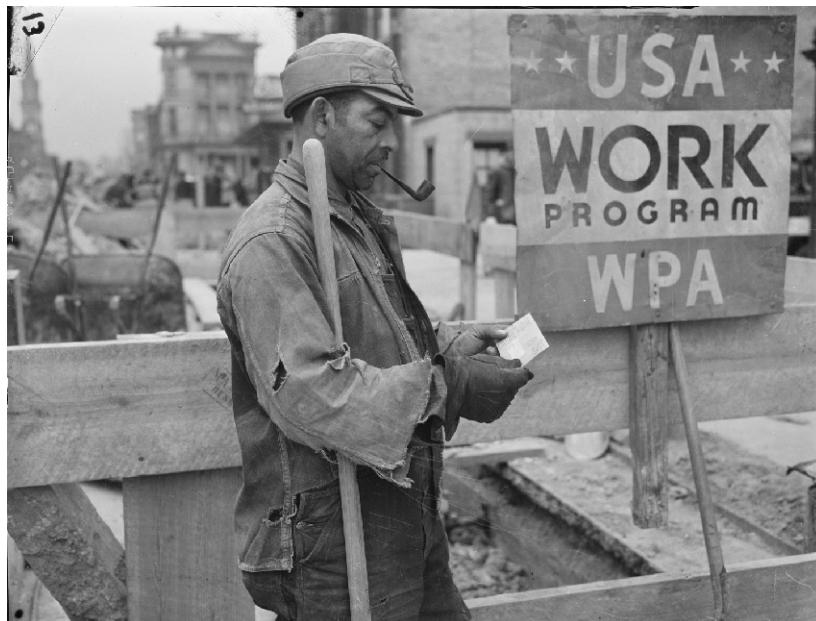

FIGURE 34.2 A worker employed by the Federal Works Progress Administration (WPA) that ran from 1935 to 1943 during Great Depression receives a paycheck. (credit: "Photograph of Works Progress Administration Worker Receiving Paycheck" by Federal Works Agency. Work Projects Administration. Division of Information. 7/1/1939-1943/National Archives Catalog, Public Domain)

In 2010, President Barack Obama signed the Patient Protection and Affordable Care Act (PPACA or ACA) into law. This was the government's first major effort to improve access to health care since the introduction of Medicare and Medicaid in 1965. As a result of the ACA, by 2016, the number of uninsured U.S. citizens was cut nearly in half. Another beneficial, client-centered outcome of the ACA was a reduction in clients' out-of-pocket costs due to **preexisting conditions**—health problems diagnosed before an insurance policy goes into effect. The ACA limited insurers' ability to refuse to pay for treatments for preexisting conditions (Office of Disease Prevention and Health Promotion [ODPHP], 2020b). A major goal of the ACA was to improve the health of Americans who lived near or below the poverty line. Without health insurance, visiting a medical provider for preventative medicine was a luxury many could not afford. Often, the only place a low-income client could be treated for an illness or injury was the

emergency department (ED). Although treatment in the ED requires no up-front payment, the relative cost of care in this medical setting generates large medical bills that uninsured clients may be unable to repay. This debt makes low-income families even more financially unstable as it lowers their credit scores and drives them toward medical bankruptcy. While this may sound like a problem that only affects individuals or families, this medical debt can be the entry into a multigenerational financial ruin.

The **cycle of poverty**, also known as the poverty trap, refers to a series of events that occur between generations. The main idea is that once a person or family becomes impoverished, it is almost impossible to change their economic status, and an external intervention is needed to break the cycle (Maryville University, 2022). As seen in [Figure 34.3](#), many factors play a part in perpetuating this cycle.

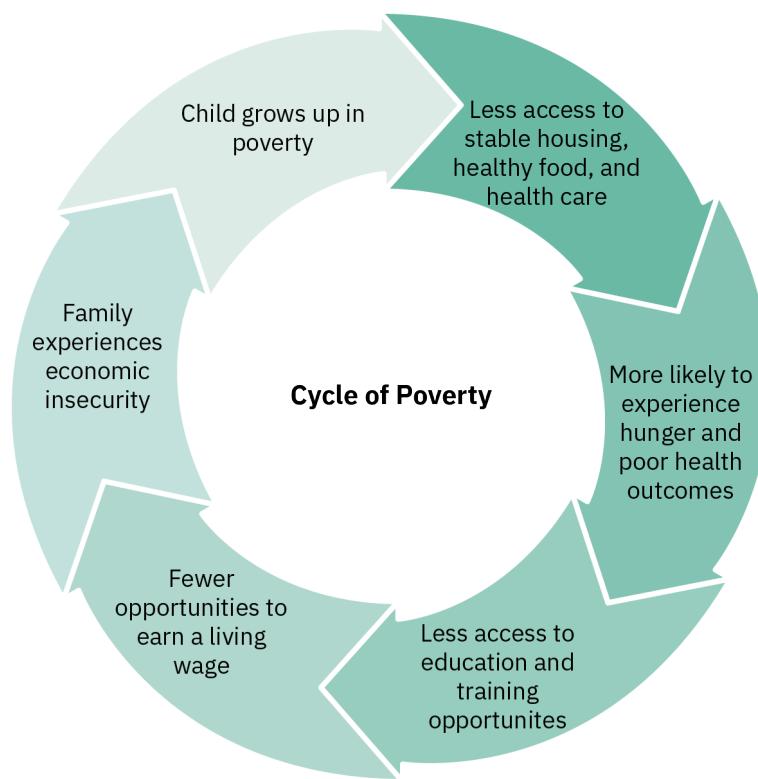

FIGURE 34.3 The cycle of poverty most often begins when a low-income family has children but may also begin when students fail to graduate high school and have difficulty finding work that pays a living wage due to their limited education. (attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

The cycle typically begins when a child is born into a poor family with few resources to create opportunities for healthy growth or advancement (Coughlin et. al, 2022). Children are often the family members who are affected the most by poverty, with one in seven children in the United States living in poverty (Children's Defense Fund, 2023). Children depend on their families to meet all their needs, such as food, clothing, and shelter. As discussed in [Caring for Vulnerable Populations and Communities](#), the presence of children in a family is a financial burden on all the other members (de la Sablonnière, 2017).

THE ROOTS OF HEALTH INEQUITIES

The Financial Roots of Health Inequities

In the article [U.S. Healthcare Policy and Child Poverty](https://openstax.org/r/academicpedsjnl) (<https://openstax.org/r/academicpedsjnl>), the authors discuss how the structure of the American health care system leads to high medical bills for the uninsured and the many negative effects these bills have on the children of families with health care debt. The authors offer three suggestions for addressing this issue, including raising the minimum wage, capping the costs of medications, and offering government-sponsored low-cost childcare for working parents.

Read the article, and then respond to the following questions.

1. Which of these ideas would be the easiest for the government to implement? Why?
2. Which idea would do the most to improve the lives of children born into the cycle of poverty?
3. Are there other ways to address this problem that the authors did not suggest?

(See Sharfstein & Thornton, 2021)

Families in the cycle of poverty can have several disadvantages compared to families with financial stability. Some of these negative social determinants of health include

- low level of education,
- few marketable job skills,
- lack of transportation,
- frequent moves due to eviction,
- high levels of debt that can lead to recurrent bankruptcies,
- depression, and
- higher-than-average incidence of alcohol and substance misuse.

For impoverished families, the more of these factors are present, the more difficult it will be for them to improve their economic situation, even with the support of friends and family (Coughlin et. al, 2022). Breaking the cycle of poverty can be even more challenging for people who lack family support or live in remote and sparsely populated areas. This relative isolation is another barrier for individuals experiencing poverty to overcome. When thinking of positive predictive factors, or circumstances that help break the cycle of poverty, two that come at little cost are social support and social capital (Dickey et.al, 2022).

Social support is both actual and perceived support from a person's social network, such as coworkers, friends, and family. Having a family member or neighbor who can babysit a sick child to prevent a caregiver from missing work is a form of social support; this allows the caregiver to avoid a day of lost wages, which might destabilize the household's monthly finances. **Social capital** refers to resources accessed through social connections, or networking, which decrease barriers to health care. An individual notifying a friend about an opening at their workplace for a job with higher wages and/or benefits and providing the friend with a referral letter is an example of social capital in action. Unfortunately, when people are already living in an impoverished state, they often lack friends and acquaintances with significant social capital, and this creates barriers to economic support (Dickey et al., 2022).

Children living in poverty are more likely to experience malnutrition (due to a lack of quality foods), disease (due to poor sanitation and lack of immunizations), and reduced access to education (Sharfstein, 2021). Research shows that the effect of interventions aimed at childhood nutrition and early childhood education through programs like Head Start has increased the high school graduation rate of children impacted by these programs (Bitler & Figinski, 2019).

Community health nurses use policies and programs to improve childhood nutrition and to encourage early childhood education, well-child checks, and vaccinations. At the local level, improving childhood nutrition happens through food assistance programs, often called food pantries, and zoning policies that encourage the building of grocery stores in underserved areas to increase the presence of fresh foods and eliminate food deserts.

States can support families by providing supplemental funding to their Head Start centers, which provide children ages 3 to 5 with early educational interventions, free hot meals, and education and resources for caregivers. Children from infancy to age 3 can be enrolled in Early Head Start where available, which provides parents with a safe, no-cost alternative to paid childcare (U.S. Department of Health and Human Services [HHS], 2023).

At the national level, the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) and the Supplemental Nutrition Assistance Program (SNAP) provide nutritional support for families. These programs provide healthy food needed for children's growth and development and maintain nutritional health in adults (Benefits.gov, 2021). A recent evaluation of the effects of SNAP on child health has shown that the program has helped reduce child poverty and that without the support of SNAP as a primary food source for a family, twice as many children would live in deep poverty (Trisi & Saenz, 2020).

\$35 INSULIN CAP FOR SENIORS ON MEDICARE

[Access multimedia content \(<https://openstax.org/books/population-health/pages/34-1-social-planning-and-policy-change>\)](https://openstax.org/books/population-health/pages/34-1-social-planning-and-policy-change)

In this video, Robin, an older adult with diabetes who is on Medicare, describes how a recent health policy has greatly impacted her life and finances.

Watch the video, and then respond to the following questions.

1. Why do you think the government put a limit, or “cap,” on the amount pharmacies can charge for insulin for clients enrolled in governmental health programs such as Medicare?
2. Could limiting the cost of insulin for every client help break the cycle of poverty? Why or why not?
3. What are some ways that lowering the cost of insulin could help improve the overall health of individuals who have diabetes?

34.2 Why Are Nurses Key Players in Health Policy?

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 34.2.1 Discuss the nurse’s role in health policy formation.
- 34.2.2 Explain how nurses can influence social policies to promote justice, fairness, and health equity.
- 34.2.3 Discuss the importance of nurses’ contributions as leaders in policy issues.

Nursing is the single largest health care profession in the United States, with almost 5.2 million registered nurses in 2023 (American Association of Colleges of Nursing, 2023). With such an incredibly large number of members of the profession, nurses have the potential to impact health policy at all stages—from policy formulation through adoption and evaluation. To effectively influence health care quality, nurses must capture the attention of community partners and policymakers to make nursing care issues visible. Nurses have the advantage of strength in numbers. To benefit from this advantage in creating and changing policy, using a coordinated approach is helpful. Nursing advocacy groups, also called special interest groups, combine the voices of their members to draw attention to the problems or issues they wish to change.

An example of a nurse advocacy group that works within the nursing profession to spark positive changes in those around them is Healthy Nurse, Healthy Nation (HNHN). Created through a collaboration between the American Nurses Association (ANA), the American Nurses Foundation, and the American Nurses Credentialing Center, the goal of this advocacy group is to have nurses engage in personal care activities to avoid burnout, stress, and fatigue (HNHN, 2023). By modeling these self-care actions, nurses can influence their friends and families to do the same. Joining an advocacy group that represents an issue of personal importance is an excellent way for an individual nurse to become a part of policy change.

The separate areas of focus in which nurses play a role in shaping health policy have been described as **four spheres of political action in nursing** and include (de la Sablonnière, 2017)

- the nursing workplace,
- the government,
- professional organizations, and
- the local community.

In the workplace, nurses can serve on committees that evaluate current policies and create new ones, such as school nurses advocating for the removal of soft-drink machines from the cafeterias to occupational health nurses working to make the grounds of a facility a nicotine-free zone.

On a local or state level, nurses can use the power of the media to obtain support for community initiatives directed at improving the health of the area, such as advocating for changes in property zoning to keep businesses that release chemical fumes or particulate-laden smoke away from schools (Deschaine & Schaffer, 2003).

Membership in professional nursing organizations such as the ANA is an excellent way for nurses to use a united voice in lobbying governmental officials to change health policies (Muetzel et. al, 2022). In addition, nurses can

lobby their legislators directly through telephone calls, letters, and meetings with their elected representatives. Although each nurse has the power and potential to use their individual voice in each of the four spheres to influence health policy, collective action can bring transformational changes that can improve clients' health throughout the nation. [Advocating for Population Health](#) describes the nurse's role as an advocate in more detail.

In addition to the ideas already listed, another way that nurses can present their questions and concerns at any management level is through writing a policy brief. There are four types of briefs that can be used to share public health evidence, as shown in [Table 34.1](#).

Type of Brief	Description
Information Brief	A concise summary of the current research on a policy method, approach, or other related concerns
Issue Brief	A summary of the best available evidence on a public health problem with no current solutions
Policy Brief	Builds on an issue brief to include the most current evidence-based best practices or health regulation options that could be used to address the public health issue
Policy Impact Brief	The most in-depth briefing document; provides a summary of the best available evidence on health, economic, or budgetary impact of one or more policies for a public health problem; appropriate when evaluations and evidence exist on the health or economic impact of the policy

TABLE 34.1 The Four Types of Policy Briefs (See Centers for Disease Control and Prevention [CDC], 2020a.)

A well-written policy impact brief completes all of the following: clearly describes the concerns, the effects of the issue, and why it matters to the policymaker's constituents. The steps of writing a policy impact brief are much like those of preparing to give an SBAR shift report. Rather than providing just the situation, background, assessment and recommendations, a policy impact brief will begin with a title and summary before describing the problem and any research or policies related to the problem. The impact brief then ends with recommended solutions along with the references and sources used to prepare the brief. The Centers for Disease Control and Prevention (CDC) provides [resources and information](#) (<https://openstax.org/r/cdcgovpolicypolaris>) on writing briefs.

THE ROLE OF THE NURSE IN PUBLIC HEALTH POLICY

[Access multimedia content](#) (<https://openstax.org/books/population-health/pages/34-2-why-are-nurses-key-players-in-health-policy>)

In this video, Dr. Bialous of the University of California San Francisco School of Nursing discusses the role of nursing in shaping public policy.

Watch the video, and then respond to the following questions.

- How can nurses position themselves at the early stages of the policy process rather than at implementation only?
- What are some ways to make yourself visible as a nurse when seeking policy change?
- How do nurses influence health policy statements?

Social justice is the fair and equal treatment of individuals. Social justice in nursing happens when client rights are protected, resources are distributed fairly, and treatment decisions are unbiased (Abu, 2020). Health equity is “the state in which everyone has the opportunity to attain full health potential, and no one is disadvantaged from achieving this potential because of social position or any other socially defined circumstance” (National Academies of Sciences, Engineering, and Medicine [NASEM], 2017, p. 32). Nurses can increase social justice in their daily lives by being strong advocates for their clients (NASEM et al., 2021).

As has been discussed throughout this text, health is affected by a wide range of social determinants of health (SDOH), including housing, transportation, nutrition, physical activity, education, income, laws and policies, and discrimination (CDC, 2020b). Because nurses work with clients in a wide variety of settings, such as inpatient, outpatient, school, correctional, and occupational health, they can play a major role in addressing the underlying causes of poor health. Nurses are uniquely positioned to drive social justice and equity in health care due to the

level of trust they hold with clients.

Nurses can influence social policy to improve health equity through four approaches (NASEM, 2021):

- Addressing social needs in clinical settings
- Addressing social needs and SDOH in the community
- Using interdisciplinary collaboration to meet multiple needs
- Advocating for policy change

The depth of knowledge that nurses gain through their interactions with clients allows them to recognize and understand the variety of factors that influence daily wellness and longevity. Nurses can use this client-specific knowledge to promote justice by creating individualized interventions and working with other disciplines and health allies to acquire the resources the client will need to implement those solutions (Timmons, 2021).

CASE REFLECTION

Advocating for Individual Clients

Read the scenario, and then respond to the questions that follow.

To return to the scenario from the beginning of this chapter, at Alex's health department, some of the clients being treated for active TB are required to take each dose of medication in the presence of a health care worker. This process is called **directly observed therapy** (DOT) and is implemented when a client is at high risk for noncompliance, such as with clients who lack a permanent address. Alex has noticed that the policy in their department currently requires every client to come to the health department daily to obtain medication doses. One of the current clients uses a wheelchair and struggles to make the daily trip to the health department due to their mobility issues. Alex is concerned that this situation is not equitable for that client and works with the clinic managers to send an outreach worker to client's residence each day instead of requiring the client to make the difficult journey to the clinic.

1. Why is asking the client's family to give them their medication instead of a health department worker not a viable solution to this problem?
 2. How could the TB clinic staff build rapport and trust with their clients?
 3. How does using DOT for clients with TB help limit the spread of the disease?
-

Nurses can influence local, state, and national social justice policies ([Figure 34.4](#)). For example, nurse administrators can create policies to increase diversity in the workplace, encourage multilingual staff to become certified medical translators, increase diversity in hiring, and offer virtual clinical services through telemedicine. [Table 34.2](#) provides other ideas of how nurses can participate at these three levels.

FIGURE 34.4 There are many ways for nurses to draw attention to unfair or just social policies. Nurses created this parade float to call attention to the health needs of rural communities and Indigenous Peoples, whose livelihoods and cultures are closely dependent on the natural environment. (credit: “The Nurses’ Float, decorated by registered nurses from across the United States, in the 124th Rose Parade in Pasadena, California” by Carol M. Highsmith/Library of Congress, No known restrictions)

Local Level

- Participate in the creation and review of policies at their work site to minimize bias
- Engage with local legislators on health-related issues in their community
- Work with a local advocacy group to raise awareness of health-related issues in their community
- Maintain and use a current list of local support agencies, free clinics, and shelters
- Offer client paperwork and educational handouts in multiple languages

State Level

- Support political candidates who advocate for those social justice issues that matter to you
- Work with the state’s board of nursing to raise awareness of social justice issues affecting nurses
- Lobby the state’s members of Congress to pass legislation giving increased access to care

National Level

- Serve in public- and private-sector leadership positions for national health advocacy groups
- Join a national nursing organization that lobbies for national policy changes

TABLE 34.2 Ways Nurses May Influence Social Justice Policies

34.3 Policy Development

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 34.3.1 Describe the stages of the policy development process.
- 34.3.2 Explain how policies are conceptualized, developed, adopted, and evaluated.
- 34.3.3 Apply the CDC’s policy analytical framework to identify, analyze, and prioritize policies that improve health.
- 34.3.4 Discuss the role of the nurse in policy evaluation.

The previous section discussed why nurses are important in health policy, but many nurses may be unfamiliar with how policies are created. This section discusses the steps of formal policy creation, including the structure used to draft a new or amend an existing policy.

Stages of the Policy Development Process

The term **policy development process** (also referred to as **health policy process**) describes the steps or stages that are followed as a specific problem or concern generates a plan of action intended to correct it. Think of this as an umbrella term that captures all stages from the idea for a new policy to the evaluation of the policy. This is similar to the steps of the nursing process, so this should feel familiar. There are many models that describe the steps of policy development, but one of the most commonly used in creating public health policy is the **stage-sequential model**, illustrated in [Figure 34.5](#).

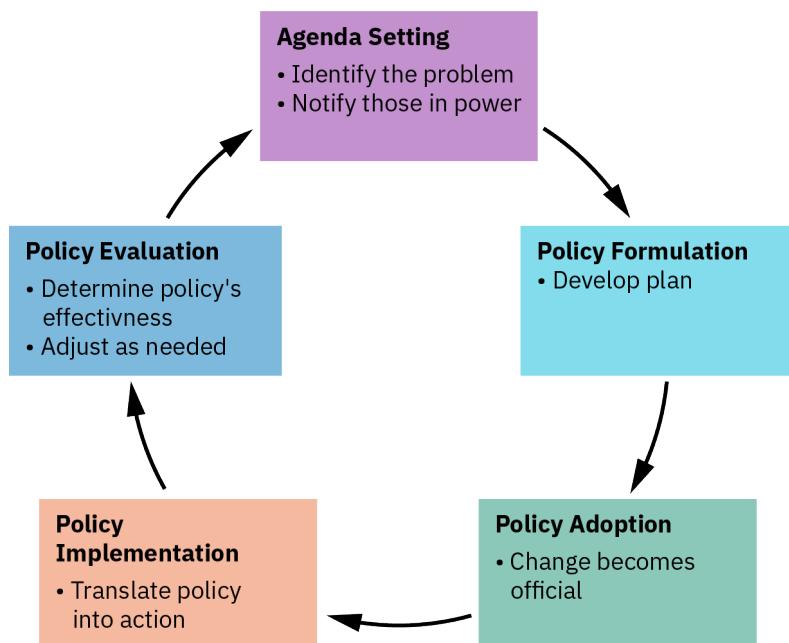

FIGURE 34.5 The stage-sequential model of policy development closely parallels the nursing process. (attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

This model breaks the policy development process into five general stages (CDC, 2020a):

- Agenda setting
- Policy formulation
- Policy adoption
- Policy implementation
- Policy evaluation

Again, these steps likely look familiar as in this model the policy development process is very similar to the nursing process. Let's review each stage and its parallel in the nursing process.

The first stage is **agenda setting**. This stage combines two steps of the nursing process: assessment and diagnosis. Before a policy addressing an issue can be created, it is first necessary to define the problem clearly. For example, if a clinic does not allow children to be present during their caregiver's appointment, this policy might lead to canceled or skipped appointments when childcare plans fall through, negatively influencing the caregiver's health. This particular situation can be dealt with by changing the existing policy. Having identified the problem, the next step would be to bring it to the attention of those with the power to change the policy. In this example, the policy directors may be the health care providers, nurses, and the clinic manager, and the individual who identified the problem could send these individuals an e-mail or talk to them directly about their concerns (Coughlin et. al, 2022).

For issues outside the workplace, there are many other less direct ways to gain attention for a policy issue. When activists organize a demonstration, lobbyists brief lawmakers on the current concerns of their sponsor, or investigative reporters publish stories, they are bringing light to a perceived problem (ODPHP, 2020b).

The second stage, **policy formulation**, means developing a plan to solve the previously identified problem. This is the same action as the planning stage of the nursing process. This step of policy development should result in a tangible outcome: a fully completed proposal for a new or amended policy. Returning to the previous example of the

clinic, the plan to solve this problem might be proposing new guidelines for when children may be present at a parent or caregiver's medical appointment.

The third stage, **policy adoption**, is when the policy or change in existing policy becomes official. Adoption can be as informal as a facility-wide memorandum indicating the new policy and the date it will be in effect. For example, "as of July 1, children under the age of 5 are permitted to be in the examination room with a parent or caregiver." Notifying others, such as clients, customers, or other community partners, about the new policy may also be part of the adoption process, depending on who the policy will affect. Policy adoption can also be handled formally; for example, a federal health care policy is adopted when Congress passes legislation. There is no step that corresponds directly to this stage in the nursing process.

Stage four, or **policy implementation**, happens when administrators decide how to deploy people, funding, and other resources to translate a policy into action (CDC, 2020a). Some policies do not require money or resources to implement. In the clinic example, this policy is a purely behavioral change and costs nothing to implement. However, if people or material resources are needed to enact a policy, obtaining the money to pay for them can make the implementation process much slower.

Stage five, **policy evaluation**, is the same in policy development and in the nursing process. For both, it means determining how well a policy is working. If a policy makes substantial changes to a process, involves many people, and is implemented over a long period of time, evaluation can be surprisingly difficult to accomplish. To gain an objective view of the policy's success, it is necessary to collect data on its outcomes. Government policies are frequently evaluated by comparing the outcomes of the changes to the cost of implementing the policy, which is called a **cost-benefit analysis** (CDC, 2020c). In the clinic example, evaluation of the new policy would require tracking data to know whether giving flexibility in bringing children to appointments resulted in fewer cancellations or rescheduled visits. It would also assess if the policy resulted in any unforeseen effects, such as slowing the office and clinical staff down. Finally, if the policy evaluation determines that the new or revised policy has created another problem, the whole process will begin again.

HOW POLICY IS MADE

[Access multimedia content \(<https://openstax.org/books/population-health/pages/34-3-policy-development>\)](https://openstax.org/books/population-health/pages/34-3-policy-development)

This video walks through the basic stages of the policy development process.

Watch the video, and then respond to the following questions.

1. The video uses an alternate model (six-step model), which breaks the stage of policy formulation into two parts. How does this model compare to the stage-sequential model? Which model would you be more comfortable using?
2. What examples of public policy related to health care are currently in process?
3. What are some issues in your area that a nurse might attempt to solve by seeking changes in public policy?

Health Policy Development

Three generalized groups participate in the creation of health policies:

- Private institutions (micro-level)
- State- and regional-level agencies and lawmakers (meso-level)
- Federal agencies and lawmakers (macro-level)

Policy committees consisting of facility administrators and medical personnel often develop health policies at the micro-level. The goal of health policy development at this level is to act as change agents for the future of local health care, often by drafting or changing facility policies. Although policies at the micro-level may impact a small number of people, they still do important things, like reducing practice variations or human error.

At the meso-level, health care policies concern the county, state, or larger geographical region. Each state has specific health policies that can include laws that set minimum hospital stays for new mothers and babies and policies that outline disease reporting. County and state health departments and state boards of nursing fall under the meso-level.

Macro-level health policies affect the nation. These policies are written by elected and appointed officials with input from other professionals. Advocacy from nurses and nursing organizations is especially important at this level because few government officials have the background in health care needed to create health policy. The CDC's Global Health Center works closely with the governments of other countries and other international health agencies (such as the World Health Organization) to address new and emerging health concerns. Measures to contain or control the international spread of a disease can be accomplished by this collaboration (Jakab et al., 2021).

Health policies begin to take shape when individuals from one of these levels identify a health problem that needs to be addressed to improve the health of a specific group. After a problem is identified, it is time to do some investigation into the background of the problem: How long has it been happening? Whom does it affect? Who has the authority to make a change? What kind of changes would be acceptable to the affected people? The data collected by asking these questions comes from the people affected by or involved with the problem, referred to simply as community partners or interested parties, and sometimes referred to as stakeholders.

Primary community partners are the people or groups that stand to be directly affected by a policy, either positively or negatively. For example, the primary partners in a decision about whether or not to close a free clinic provided by a university would be the students attending that school.

Secondary community partners are people or groups that are indirectly affected by a policy. If the campus clinic closes, students without health insurance might be forced to seek care in an ED. The ED staff are indirect partners, as closing the free clinic increases the amount of traffic through their department.

Key community partners may belong to neither of those two groups but have an interest or expertise in an area of policy. These partners may include groups that can provide or raise money for the development and implementation of a policy, influential community members, elected or appointed government officials, and more (Concannon et al., 2018).

It is necessary to understand an issue completely before making any attempts to create a solution (CDC, 2020a). [Health Disparities](#) discussed how to assess a population for health disparities in a participatory manner. A community health nurse performs these actions when doing a windshield survey: an environment is evaluated for resources and deficits, community members are asked about their concerns and perceptions of health issues, and demographic data are collected before the nurse can choose a priority problem for the group and begin to make plans to remedy the identified problem.

The development of a health policy is the next step. When a policy is being created at the meso- or macro-levels, an increased number of outside resources and key community partners may be needed to make a policy a success. This step often includes input from nongovernmental health organizations, which include nonprofits. One such group, the Robert Wood Johnson Foundation (RWJF), collects data from many sources and summarizes these findings along with recommendations for policies and suggestions of how those policies can be implemented and supported. One of the recent briefs the RWJF produced, [Public Health Infrastructure—Centering Equity in a Modern Public Health System](https://openstax.org/r/rwjforgeni) (<https://openstax.org/r/rwjforgeni>), was designed for use by the New Jersey state legislature. The brief outlines gaps in the current public health policies, prioritizes the gaps, provides research data about the gaps, and outlines ways that changes in current policy can close the gaps and improve overall health in New Jersey by increasing health equity (RWJF, 2023).

Once a health policy is written, it must be adopted by the institution or government body responsible for its implementation. Policies written at the local, state, and federal levels can be passed as laws with approval from the legislators at each level. Writing a policy is, at times, a more straightforward process than adopting that policy. For a policy to be adopted and implemented, it needs support from the people who will carry out its outlined tasks and support from the source funding the change.

Returning to the earlier case scenario about the public health department where Alex works as a nurse, consider what might happen if a member of management decided that for maximum accuracy when taking vital signs on clients with TB, they must use the rectal temperature method. While core temperatures are more accurate than temperatures taken with less invasive methods, this policy would be unlikely to have support for adoption.

Evaluation of policy is sometimes written into the policy law or requested as a step in the implementation of the policy (ODPHP, 2020b). Policy evaluation examines a policy's implementation, performance, and impact on the

intended target. The data gained by assessing the effect of the policy on its intended audience helps the policy developers know whether the expected outcome is happening. The evaluation results can also be used to modify the policy itself or how it is put into practice if unintended results occur. If changes are needed, the policy can go back into the cycle at the development stage so that it can be modified in an attempt to improve its effects (CDC, 2020a). If parts of the policy's original goals remain unmet or unanticipated issues have happened, evaluation helps guide any necessary changes to the policy before it is re-implemented (CDC, 2020c).

If a policy has been so successful that its targeted problem no longer exists, then the policy can be retired or terminated. Sometimes a policy effectively addresses the issue it targeted but in doing so creates a new problem that requires attention. One example was the move in the late 1950s (Mills, 2023) to deinstitutionalize clients in mental hospitals after the advent of medicines to treat depression and schizophrenia. While many clients who were formerly inpatients were able to transition to life outside the hospital, a significant proportion of clients destabilized and became unable to care for themselves, leading to homelessness. The increase in the number of individuals experiencing homelessness with mental illness was an unintended effect of the deinstitutionalization policy (Yohanna, 2013).

Returning to the public health department where Alex works, if the department wanted to improve client adherence to attending their directly observed therapy appointments, they might make a policy change that included a small incentive for compliance. Rather than waiting for the current group of clients being treated to be discharged from treatment before evaluating the policy change, they could gather and monitor data continuously. If they found a problem with the policy change, such as an unintended decrease in client adherence, the staff at the health department could make the necessary adjustments as soon as they noticed the problem.

The CDC's Policy Analytical Framework

The CDC's policy analytical framework provides standardized steps for creating a policy and consists of the following three domains (CDC, 2020c):

- Problem identification: A public health issue is identified, a likely cause is suggested, and ideas for fixing the issue are developed.
- Policy analysis: The different proposed solutions are evaluated, and one is chosen.
- Strategy and policy development: Now the steps needed to arrive at that solution are specified. This includes deciding who is responsible for implementation, data collection, and funding.

This framework can be used to create policy at any level. It is designed to help the creators think through each part of a proposed policy so that the problem being addressed is clearly identified, more than one potential solution is explored, and the solution strategy chosen is likely to be effective. The benefit of using the analytical framework is that it takes a policy writer through all the necessary steps in the correct order. Think of it as a basic recipe for how to write a policy. Because the steps are clearly delineated, even a novice can draft a policy containing all the needed components for its implementation (CDC, 2020a).

WHY POLICY MATTERS

[Access multimedia content \(<https://openstax.org/books/population-health/pages/34-3-policy-development>\)](https://openstax.org/books/population-health/pages/34-3-policy-development)

This video from the CDC explains why creating health policies can have a large impact on public health outcomes.

Watch the video, and then respond to the following questions.

1. Why do health policies have the potential for large impacts on health?
2. How can nurses be involved in the policy process?
3. What are some issues in your area that a nurse might attempt to solve by helping to create public policy?

Nurses' Role in Policy Evaluation

Community health nurses collaborate with individuals, community organizations, health facilities, and local governments to successfully implement and evaluate community health policies. Beginning with evaluating policies in their workplace, nurses can gather information on how staff perceive current policies. Another beginning step is to join and participate in a professional nursing organization. By being a part of a collective group, nurses can apply

their combined knowledge and experience to promote effective health policies.

Nurses can also participate in policy evaluation by using evidence-based research and data to contact their legislators regarding health policy issues or concerns. Unless the legislators who developed and are evaluating a health policy have a clinical background, they may not be able to understand the strengths and weaknesses found after the policy was enacted. Nurses can assist their legislators by summarizing the content of research findings (Turale & Kunaviktikul, 2019).

34.4 Advancing Health Care Policies

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 34.4.1 Identify evidence-based policies linked to social and economic improvements.
- 34.4.2 Discuss the Health in All Policies (HiAP) approach to address health needs.
- 34.4.3 Defend policies that promote health and prevent harm.
- 34.4.4 Support the development of policies based on population findings.

Health policies shape every client's interaction with a health care team member. Their influence may be invisible if they are effective or extremely visible in cases where a policy is not providing a good outcome. When a policy no longer meets the needs of the people that it was intended to help and protect, it needs revision. Sometimes policies require revision because technology and current practice have advanced beyond the scope of the issue. This section will explore how nurses can use data and community partner resources to improve health policy.

Using Evidence-Based Policies

Using evidence-based policies is especially important in health care planning to ensure that interventions are safe and effective, reach the intended population, and use available resources. **Evidence-based policies** are developed from reliable data and statistics rather than intuition and personal opinion. A wealth of free government resources for current evidence-based practice (EBP) guidelines exist, as discussed in [Evidence-Based Decision Making](#), and these resources can be used for the development of EBP policies (National Institutes of Health [NIH], 2023).

Healthy People 2030 is based on the concept that evidence-based policies can improve the country's overall health by addressing direct health needs as well as SDOH. The Healthy People 2030 website has a library of downloadable evidence-based tools and educational materials (ODPHP, 2020c). Laws and policies at the local, state, and federal levels related to Healthy People 2030 are in place to improve the safety and well-being of Americans.

Another resource for evidence-based practice is the U.S. Preventive Services Task Force (USPSTF), an independent panel of experts in primary care and prevention that systematically review the evidence of effectiveness and develop recommendations for clinical preventive services (USPSTF, 2023). The Health Resources and Services Administration's [HRSA] Bright Futures program provides evidence-based clinical guidelines for mothers and children (from birth through age 18) to help increase the quality of primary and preventive care (HRSA, 2023a).

Evidence Based Resources

[Evidence-based resources \(EBRs\)](#) (<https://openstax.org/r/healthgovhealthypeople>) are published reviews of intervention evaluations and studies to improve health. The Healthy People 2030 website has organized them into intuitive topics so you can easily find what you are looking for. There are hundreds of EBR resources for SDOH, populations, health conditions, health behaviors, settings, and symptoms.

Health in All Policies

The CDC's **Health in All Policies** (HiAP) is "a collaborative approach that integrates and articulates health considerations into policy making across sectors to improve the health of all communities and people" (CDC 2020c). The HiAP approach is a framework intended to help governmental programs and nongovernmental organizations in planning their policies and outreach campaigns. The goals of HiAP are to

- promote health, equity, and sustainability,

- support collaboration between community partners,
- benefit multiple partners,
- engage community partners, and
- create structural or process change that is long-lasting.

HiAP recognizes that health depends on SDOH—factors beyond health care—and that they are often beyond the scope of traditional community health activities. Promoting healthy communities requires addressing those SDOH, such as transportation, education, access to healthy food, economic opportunities, and more to achieve the most benefit from planned interventions (Tucker, 2014).

Using HiAP and Healthy People 2030 goals increases the potential for state, territorial, and local health departments to improve health outcomes (ODPHP, 2020c). An example of a HiAP approach is a city planning policy that creates zoning for a new retirement community for older adults. During the planning phase of construction, the project team would perform an impact assessment of the proposed location. One assessment would be the potential health implications for the residents based on possible sites for the new community. If the community is built near a swampy area of marshland that is a breeding ground for mosquitos, what is the potential for West Nile virus and other mosquito-borne illnesses? If the location is close to a busy highway, how might the increased airborne pollutants affect the residents? If the community is built on the outskirts of the town, can existing public transportation options meet the unique transportation needs of the senior residents? Is there easy access to health care in proximity to the proposed location? Asking these and other questions using the HiAP approach helps guide the project team's decision-making across all areas to maximize health-enhancing options and to minimize potential health risks for the future residents (CDC, 2020c). [Leading the Way to Improving Population Health](#) discusses HiAP in more detail.

Theory in Action

Health in All Policies (HiAP)

[Access multimedia content \(<https://openstax.org/books/population-health/pages/34-4-advancing-health-care-policies>\)](https://openstax.org/books/population-health/pages/34-4-advancing-health-care-policies)

This short video from the American Public Health Association discusses the application of HiAP in the context of malaria prevention.

Watch the video, and then respond to the following questions.

1. What SDOH influence the incidence of malaria?
2. How do non-health agencies play a part in HiAP?
3. How did the different groups in the video work together on the malaria reduction project?

Nurses' Role in Advancing Health Care Policies

When nurses work to defend policies that improve health care outcomes, they are ultimately advocating for their clients. Nurses experience the daily influence of policy and politics in health care. As the largest group in the global health care workforce, nurses are uniquely positioned to observe the ways in which health policy affects clients and their communities (Kovner, 2023). Nurses are crucial to defending health policy because they spend much of their time interacting with clients and understanding their needs. Nurses can relay successes and limitations to policymakers, whether directly through contact with their legislators or through the collective voice of a nursing organization like the ANA (Pollack-Porter et al., 2018).

The ANA has worked to defend provisions of the ACA since it was introduced in 2010. One of the policies it has focused on is the information technology initiative. The ANA has advocated for electronic health records (EHRs) to promote client safety, joined health information technology alliances such as the Healthcare Information and Management Systems Society and the Alliance for Nursing Informatics, and developed educational products for e-health campaigns. Not all nurses were happy about the change from paper charting to EHRs, so the ANA worked to defend that policy by educating nurses about the improvements in client safety offered through the use of computerized client charts (ANA, 2023).

The information obtained by collecting data on a group of interest can be used by policymakers to tailor planned activities and interventions to directly target the members of that group (Leal, 2022). Nurses can support this process by keeping careful records of health needs and barriers to improved health in the selected client group. As discussed in [Advocating for Population Health](#), nurses can also act as advocates for policy development when they identify a health gap in a client population.

An example of this is nurse Judith Haber's work to create interest in policies aimed at whole-person care for people who use Medicare. Dental care is not a covered benefit for these individuals unless the issue is related to very specific effects of medical treatment (such as pulling teeth that are loosened by treatment for cancer). Sixty percent of Americans aged 65 and older are enrolled in Medicare, and unless they purchase a private dental coverage policy, they must pay for all dental treatment out of pocket. Dr. Haber and her colleagues in the Oral Health Nursing Education Practice (OHNEP) program (a national nursing oral health initiative) have worked with the Centers for Medicare and Medicaid Services to improve access to dental care for several years. While dental care is not yet completely covered, through the efforts of these nurses, Medicare has been expanded to include benefits to clients with medical conditions (like artificial heart valves) that are impacted by oral health (Kovner, 2023).

Some applicable advocacy strategies for any nurse include joining a national nursing organization to draw attention to health disparities with a collective voice. Politics and policy are at the core of health care planning and improvements to population health, and by using the power of organized lobbying, nurses can create awareness of issues that will drive the development of policies to address these issues (Brokaw, 2016).

Chapter Summary

34.1 Social Planning and Policy Change

The term *policy* most commonly refers to a formal or informal rule, law, or plan of action followed by a group, organization, or government. A family living in poverty may not have adequate food, housing, or access to services, which could be a root cause of their health problems and contributes to the continuation of the cycle of poverty.

34.2 Why Are Nurses Key Players in Health Policy?

Understanding how policies affect their practice prepares nurses to address issues in the communities in which they live and work and to improve health outcomes. Each nurse has the power to use their individual voice to influence local health policy, and collective action by nursing organizations has the power to change national policy.

34.3 Policy Development

Health policies are developed through a flexible

Key Terms

agenda setting the identification of an issue or issues that require resolution and bringing these issues to the attention of community partners and concerned parties

cost-benefit analysis analysis that compares the outcomes of the changes to the cost of implementing a policy

cycle of poverty a series of events that occur between generations; once a person or family becomes impoverished, it is almost impossible to change their economic status, and external intervention is needed to break the cycle

directly observed therapy (DOT) system in which medication is dispensed at a clinic or pharmacy to a client one dose at a time to ensure compliance for those who are at high risk for noncompliance (such as with clients who lack a permanent address)

evidence-based practice policies policies developed from reliable data and statistics rather than intuition and personal opinion

four spheres of political action in nursing the four areas in which nurses can effect change: workplace, government, community, and professional organizations

Health in All Policies (HiAP) a collaborative approach to policy creation that integrates and articulates health considerations into policy development across sectors to improve the health

process that encompasses issue identification, policy instrument development, consultation, coordination, decision-making, implementation, and evaluation. The CDC's Policy Analytical Framework consists of the first three segments of the policy process: problem identification, policy analysis, and strategy and policy development. Policy evaluation is the examination of a policy's implementation, performance, and impact on the intended target.

34.4 Advancing Health Care Policies

Using evidence-based policies helps to ensure that interventions are safe and effective, reach the intended population, and use the resources available. HiAP is based on the understanding that long-standing health problems such as chronic illness, drug misuse, and spiraling health care costs are highly complex and often linked. When nurses implement and defend policies that use population health data, it is a method of advocacy.

of all communities and people

health policy policies that describe a health goal and a way to accomplish it

health policy process the steps or stages that are followed as a specific issue is identified and a plan of action intended to correct it is made

health policymaking the formulation and establishment of policies and methods of achieving the policies by government bodies or other relevant organizations to address any of the varied aspects of health care, which includes public health and the health care system

institutional policy rules that an organization has developed to govern the activities of anyone employed by or associated with the institution

laws the system of rules by which a country or community regulates the behavior and actions of its members

nursing policy sets goals and boundaries for nursing practice

policy a course or principle of action adopted or proposed by a government, party, business, or individual

policy adoption the acceptance or ratification of a policy

policy development process the steps or stages that are followed as a specific problem or concern generates a plan of action intended to correct it

- policy evaluation** determining how a policy is working and whether the intended outcomes are happening
- policy formulation** creating a plan to solve a previously identified problem
- policy implementation** the process of putting a new policy into effect through planning and funding
- preexisting conditions** health problems diagnosed before an insurance policy goes into effect and will therefore not be covered under the new insurance policy
- public policy** local, state, or national laws and regulations
- social capital** resources accessed through social

- connections or networking that decrease barriers to health care
- social justice** the fair and equal treatment of individuals
- social policy** policy decisions that promote the general welfare of the public
- social support** both actual and perceived assistance from one's friends, acquaintances, coworkers, and family
- stage-sequential model** a process that uses five steps to create a policy; these include agenda setting, policy formulation, policy adoption, policy implementation, and policy evaluation

Review Questions

- Which action would the nurse perform in the policy formulation phase of the stage-sequential model of policy development?
 - Carrying out a food inspection in a restaurant
 - Collecting data on communicable diseases
 - Developing goals and measurable objectives
 - Providing health status assessments
- Which type of policy is the public health nurse engaging in when trying to reduce the speed limit around a community playground?
 - Social policy
 - Nursing policy
 - Health policy
 - Public policy
- Which assessment finding will the nurse anticipate in a family in the cycle of poverty?
 - The family has created the conditions that keep them impoverished.
 - Members of the family have a low level of education.
 - Poverty is created by the family's laziness.
 - The family has social connections and support systems.
- Which action by a nurse represents engagement in political action at the workplace level?
 - Developing billboards about the dangers of teenage vaping
 - Being a member of a committee to promote community health screenings
 - Joining the political action committee of a professional organization
 - Running for a local political office
- Which action would a nurse perform when involved in the development of health policy at the meso-level?
 - Developing free statewide vaccination clinics
 - Performing scoliosis screenings in a local elementary school
 - Supporting a bill to reduce out-of-pocket costs for insulin
 - Collaborating on a county disaster relief policy
- Which community partners would the nurse collaborate with to determine the zoning issues involved in planning a community hiking trail?
 - Primary community partners
 - Secondary community partners
 - Key community partners

- d. Elected community partners
- 7.** Which type of policy brief is the public health nurse utilizing when providing city management with a summary of the latest research on how green spaces improve the health of a community?
- a. Information brief
 - b. Issue brief
 - c. Policy brief
 - d. Policy impact brief
- 8.** Which stage of the stage-sequential model of policy development is the nurse engaged in when determining the effectiveness of a policy?
- a. Policy evaluation
 - b. Policy implementation
 - c. Policy formulation
 - d. Policy adoption
- 9.** The public health nurse is involved in developing a community health program to improve nutrition using the Centers for Disease Control and Prevention's Health in All Policies (HiAP) approach. Which action will the nurse take?
- a. Engage all sectors to produce change
 - b. Produce change using the local health department
 - c. Present a plan for change to community partners
 - d. Develop short-term goals for program development
- 10.** Which action by the nurse is an example of influencing social justice at the state level?
- a. Raising awareness of the need for childhood vaccinations within a community
 - b. Providing health information to clients in their choice of language
 - c. Educating state senators about social determinants of health
 - d. Working with a national organization to advocate for health care for transgender individuals

CHAPTER 35

Leading the Way to Improving Population Health

FIGURE 35.1 Public health and community health nurses play a role in gathering data to help researchers seek patterns about what affects population health. This photo shows a nurse collecting information from a volunteer as part of the National Institutes of Health All of Us Research Program, which is building a diverse database to inform thousands of studies on various health conditions. (credit: modification of work “All of Us Participant” by NIH Image Gallery/Flickr, Public Domain)

CHAPTER OUTLINE

- 35.1 Learning from the Past to Guide the Future
 - 35.2 Leading Initiatives to Transform Health Systems to Reduce Health Inequities
 - 35.3 Carving a Path Forward
-

INTRODUCTION Josh, a public health nurse, works in a neighborhood with significant health disparities. The community experiences high rates of chronic diseases, limited access to health care services, environmental hazards, and socioeconomic challenges. Josh recognizes the need to address these disparities and assumes an informal leadership role to mobilize resources and engage the community in promoting health equity.

The nursing profession faces significant challenges in the next decade, including caring for an aging population with complex medical needs, increasing primary care capacity, and bridging the gap between medical care and social factors affecting well-being. Overcoming these obstacles and improving population health requires substantially increasing the number, diversity, distribution, and education of nursing professionals. This chapter comprehensively analyzes the nursing profession’s challenges and suggests several opportunities to address them. Each section of the chapter examines how Josh, a public health nurse, demonstrates leadership in addressing his community’s needs.

35.1 Learning from the Past to Guide the Future

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 35.1.1 Describe lessons learned from the past that continue to inform population health practices and decision-making.
- 35.1.2 Discuss progress in improving health.
- 35.1.3 Explain how epidemiological principles will remain essential for the community and public health nurse to safeguard and advance public health.
- 35.1.4 Recognize how the community and public health nurses can learn from past successes and failures to address emerging health challenges
- 35.1.5 Identify emerging and persisting population health challenges.

Reflecting on past public health crises is essential to improving preparedness and response strategies and understanding disease processes. These reflections offer invaluable insights that inform decision-making, policy development, and interventions in the face of emerging or recurring health threats. Previous achievements, such as eradicating smallpox and reducing infectious diseases through vaccination programs, demonstrate the success of evidence-based interventions, robust health care systems, and coordinated efforts across the industry. Community and public health nurses have played a significant role in these accomplishments, serving as leaders, researchers, educators, advocates, and collaborative health care partners.

Lessons Learned

Studying past disease outbreaks such as bubonic plague (“Black Death”), the 1918 flu (“Great Influenza”), and HIV can provide insight into managing infectious diseases. Learning from previous public health responses can inform future preparedness, response planning, and interventions. For example, during the COVID-19 pandemic, public health officials coordinated efforts, established infection control guidelines, implemented containment measures, and conducted disease surveillance based on lessons learned from the Great Influenza (Ott et al., 2007).

Lessons from previous hemorrhagic fever outbreaks, such as the Ebola virus, also offered critical insights for effectively managing and responding to the COVID-19 pandemic. Despite their distinct characteristics and diverse pathogens, several vital takeaways from Ebola outbreaks were relevant to the COVID-19 crisis. For example, the Ebola outbreaks demonstrated the need for swift detection and prompt response (Ott et al., 2007).

Past infectious disease outbreaks have also highlighted the significant impact of stigma and discrimination on affected individuals, communities, and public health responses by discouraging individuals from seeking care, reporting symptoms, or adhering to preventive measures. Stigmatizing attitudes and behaviors can lead to fear, secrecy, and concealing information, which hinder disease surveillance, contact tracing, and timely interventions. For example, during the Ebola epidemic in Liberia (2014–2016), many Liberians avoided seeking care or reporting a loved one’s death out of fear that their cultural beliefs and practices, such as washing and touching the deceased’s body, would be scrutinized and violated (Centers for Disease Control and Prevention [CDC], 2019). Health officials deemed such practices high risk as they put individuals in direct contact with the virus during a highly infectious period. This fear and practice impeded surveillance and hindered disease containment efforts. As a result, officials recognized the need to work with communities to adapt burial practices to minimize transmission risks while respecting the freshly deceased. This involved promoting safe burial protocols that minimized direct contact with the deceased (Sencer, 2023). [Figure 35.2](#) depicts a burial team managing the body of an individual who may have died from Ebola infection (Sencer, 2023).

FIGURE 35.2 A burial team in Sierra Leone conducts a safe, respectful burial for an individual who is suspected of having died from Ebola. Improving burial practices during the Ebola outbreak in Africa involved a multifaceted approach that recognized the importance of addressing cultural and community preferences. (credit: “The last burial: Alfred Kelfala from the roving Freetown Ebola burial team carefully lowers the corpse of a small child into its grave” by Simon Davis/DFID/Flickr, CC BY 2.0 DEED)

Building trust and engaging communities is indispensable for successful outbreak responses. Involving communities in disease surveillance, contact tracing, and outbreak control measures has proven effective in prior outbreaks and has been applied in the COVID-19 response.

As [Pandemics and Infectious Disease Outbreaks](#) discussed, disease surveillance primarily begins in local, state, and territorial public health departments. The COVID-19 pandemic exposed flaws in establishing effective disease surveillance systems worldwide. Outdated and inaccurate health information, insufficient resources, inadequate public health capacity, and leadership capabilities all hindered global efforts to improve health during the pandemic. Moreover, the pandemic highlighted the limitations of data collection and monitoring beyond the early stages of an outbreak. Therefore, timely and structured public data sharing across countries is paramount. These lessons learned will shape the future of disease surveillance, leading to policies, interventions, and programs that improve population health outcomes and shape the future of public health (Filip et al., 2022).

Theory in Action

Five Hard-Earned Lessons from Pandemics of the Past

The History.com article linked below describes strategies populations have used throughout history to survive a pandemic.

Read the [article \(<https://openstax.org/r/history>\)](https://openstax.org/r/history), and then respond to the following questions.

1. Define the Miasma Theory of disease spread.
2. Describe five ways people adapted to life amid disease outbreaks historically.
3. Do you think that the strategies used in the past are still relevant and effective for today and the future? Why or why not?

Gaining Insight

As noted in [What Is Population Health?](#), population health involves the health outcomes of a group of people in a population, including how those outcomes are distributed. It considers different factors that influence health, such as social determinants, economic conditions, access to health care, and individual behaviors. Population health

takes a comprehensive approach, considering societal and environmental factors contributing to health disparities and inequalities beyond the traditional health care system.

As discussed in [Foundations of Public/Community Health](#), public health is vital to improving population health. Public health initiatives and interventions, such as immunization campaigns, health education programs, screening and early detection efforts, and policies to reduce environmental hazards, are population health strategies. By addressing the underlying determinants of health and implementing evidence-based interventions, public health aims to improve the health outcomes of entire populations.

At the community level, community health nurses play a crucial role in implementing public health initiatives. As noted in [Public/Community Health in Practice](#), community health nursing refers to the health status and well-being of a specific community or a group of individuals who share common characteristics, such as geographic location, cultural background, or a particular interest. It emphasizes the health of a localized group within a larger population. Community health considers the unique characteristics, needs, and challenges of the specific community being studied. It involves assessing the community's health needs, implementing interventions to address them, and evaluating their impact. It often involves collaborations with community members, local organizations, and health care providers to improve health outcomes.

Each function—population health, public health, and community health—aims to enhance the health and well-being of populations through a multifaceted, holistic approach that addresses the interplay of factors impacting health outcomes. Nurses can gain insight from past experiences, both successful and unsuccessful, to employ evidence-based practices and customize strategies to tackle new health challenges at various levels. The past has yielded valuable lessons guiding public and community health practices, particularly in epidemiology and health policy.

Public health nurses like Josh employ a multifaceted, reflective approach. Josh works in a low-income neighborhood where residents face various health challenges, such as high rates of chronic diseases, inadequate housing, limited access to health care facilities, and food insecurity. Josh recognizes that these issues are deeply rooted in systematic inequities and that meaningful change necessitates a comprehensive approach involving population health, public health, and community health. He is aware that each function aims to improve health and well-being by addressing the complex interplay of factors that affect health outcomes. Learning from past experiences, Josh can use evidence-based practices to customize strategies to tackle these challenges at different levels through collaborations with community members, local organizations, and health care providers.

Epidemiology

As discussed in [Epidemiology for Informing Population/Community Health Decisions](#), epidemiologists study disease patterns, causes, and risk factors in populations. Past epidemiological studies have produced valuable information regarding disease patterns, health determinants, and risk factors that continue to influence health care decisions. By analyzing biological data, nurses can recognize patterns, comprehend the effects of interventions, and predict potential health outcomes. Epidemiological studies that have made significant contributions include:

- [Framingham Heart Study](#): Initiated in 1948, this longitudinal study has been instrumental in identifying and understanding cardiovascular disease risk factors for three generations. It has helped establish the link between smoking, high blood pressure, high cholesterol levels, and the development of heart disease. The findings from this study led to the development of preventive measures such as smoking cessation programs, blood pressure control strategies, and cholesterol-lowering interventions (Framingham Heart Study, n.d.).
- [Nurses' Health Study \(NHS3\)](#): Initiated in 1976, this long-term cohort study provides valuable insights into various health conditions. It has helped identify risk factors for chronic diseases, including breast cancer, colon cancer, and cardiovascular disease. In addition, the study has contributed to understanding the impact of lifestyle factors, such as diet, physical activity, and hormone use, on disease development and prevention (Nurses' Health Study, n.d.). Now in its third generation, the Nurses' Health Study continues to investigate various aspects of women's health and to identify risk factors for chronic diseases.
- [Global Burden of Disease Study \(GBD\)](#): The GBD study, initiated in the 1990s, is a comprehensive effort to quantify the global impact of diseases, injuries, and risk factors. It provides data on the prevalence, mortality, and disability associated with various health conditions, helping policymakers and health professionals prioritize interventions and allocate resources effectively. The GBD study has informed strategies for disease prevention, control, and health care planning worldwide (Institute for Health Metrics and Evaluation, 2020).

- **Human Papillomavirus (HPV) Vaccine Trials:** Epidemiological studies evaluating the safety and efficacy of HPV vaccines have been pivotal in shaping current vaccination practices. These studies demonstrated the effectiveness of HPV vaccines in preventing cervical cancer and other HPV-related diseases. In addition, the findings from these trials led to the implementation of widespread HPV vaccination programs to reduce the burden of cervical cancer and associated conditions (CDC, 2021).
- **Prospective Urban Rural Epidemiological (PURE) Study:** The PURE study is a large-scale global cohort study that examines the impact of lifestyle, environmental, and societal factors on cardiovascular disease and other chronic diseases. It has advanced understanding of the complex interactions between various risk factors and health outcomes, providing evidence for targeted interventions at the individual and population levels. The PURE study has involved 225,000 participants in 27 countries (Population Health Research Institute, 2023).

THEORY IN ACTION

Prospective Urban and Rural Epidemiological Study

[Access multimedia content \(<https://openstax.org/books/population-health/pages/35-1-learning-from-the-past-to-guide-the-future>\)](https://openstax.org/books/population-health/pages/35-1-learning-from-the-past-to-guide-the-future)

This short video provides an overview of the PURE study.

Watch the video, and then respond to the following questions.

1. Identify three focus areas of the PURE study.
2. What is a modifiable risk factor for health that the PURE study has identified?
3. What is the expected pattern of cancer worldwide over the next decade?

In public and community health, nurses will continue to rely on epidemiological principles to study patterns within groups or communities, analyze the occurrence of diseases and injuries, and develop strategies to prevent illnesses and improve overall health. [Table 35.1](#) illustrates how community and public health nurses will continue to utilize epidemiological principles in their practice.

Epidemiological Principle	Application
Surveillance and data analysis	<ul style="list-style-type: none"> • Collect and analyze data to monitor the occurrence and distribution of diseases. • Public health nurses collaborate with epidemiologists to contribute to disease surveillance efforts. In addition, they play a vital role in data collection, reporting, and analysis at the community level. • Public health nurses often work on disease incidence, prevalence, and other relevant health indicators in local health departments, clinics, or communities. This collaboration helps identify public health trends, track outbreaks, and inform targeted interventions.
Disease investigation and outbreak response	<ul style="list-style-type: none"> • When outbreaks or disease clusters occur, epidemiologists investigate the causes, risk factors, and modes of transmission. • Community and public health nurses work closely with epidemiologists in outbreak investigations, assisting with contact tracing, case management, and implementing control measures. In addition, they provide direct care to affected individuals, educate the community on prevention strategies, and collaborate with other health care providers to contain and manage the outbreak.

TABLE 35.1 Examples of How Community and Public Health Nurses Utilize Epidemiological Principles

Epidemiological Principle	Application
Program planning and evaluation	<ul style="list-style-type: none"> Epidemiological studies provide evidence for designing effective public health interventions and programs. Community and public health nurses contribute their program planning, implementation, and evaluation expertise. They use epidemiological data to identify priority health issues, set program goals and objectives, and develop strategies for intervention. Community and public health nurses also assess the effectiveness and impact of programs, ensuring that they are evidence-based and meet the community's needs.
Health promotion and disease prevention	<ul style="list-style-type: none"> Epidemiological findings guide public health nursing interventions in health promotion and disease prevention. Epidemiology helps identify risk factors and determinants of disease, allowing public health nurses to develop targeted interventions to address those factors. Community and public health nurses educate individuals and communities on healthy behaviors, administer vaccinations, conduct screenings, and promote lifestyle modifications based on epidemiological evidence.
Research and evidence-based practice	<ul style="list-style-type: none"> Epidemiology generates evidence that informs public health nursing practice and research. Community and public health nurses contribute to epidemiological research by collecting data, participating in studies, and implementing evidence-based interventions. In addition, they translate epidemiological findings into practice, adapting interventions to meet the needs of diverse populations and settings.
Advocacy and policy development	<ul style="list-style-type: none"> Epidemiological data are essential in advocating for public health policies and influencing health-related legislation. Community and public health nurses use epidemiological evidence to advocate for interventions, resource allocation, and policies that promote population health. They collaborate with policymakers and community organizations to shape public health policies and strategies based on epidemiological findings.

TABLE 35.1 Examples of How Community and Public Health Nurses Utilize Epidemiological Principles

Policy and Legislative Changes

Historical public health policy and legislation changes have improved population health. For example, implementing smoking bans, seat belt laws, and food safety regulations has positively impacted health outcomes. Policy and legislative changes have improved access to health care services and health care coverage. Implementing the Affordable Care Act (ACA) expanded insurance coverage and prohibited insurers from denying coverage based on preexisting conditions. Such policies aim to ensure more individuals have affordable access to essential health care services, reducing barriers to care and improving population health.

Historical advocacy efforts have driven significant progress in improving population health. Examples include campaigns for safe working conditions and access to clean water. By learning from past advocacy successes, community and public health nurses can build on previous achievements, mobilize communities, and drive policy changes to address current and future health challenges. Understanding the impact of policy changes in the past can inform the development and implementation of effective policies in the future, addressing emerging health challenges and promoting health equity.

Looking at historical experiences allows nurses to recognize the influence of social, economic, and ecological factors on population health. Historical data can reveal disparities in health outcomes, the impact of social movements on public health, and the effectiveness of interventions targeting social determinants of health.

Reflecting on past public health practices raises critical ethical concerns. Historical examples of unethical medical research, such as the Tuskegee syphilis study, have influenced the development of ethical guidelines and

regulations in public health research and practice. Learning from the past helps ensure that future public health initiatives prioritize ethics, protect human rights, and prioritize the well-being of individuals and communities.

By drawing on the past, public community and public health nurses can learn from successes and failures, apply evidence-based approaches, and adapt strategies to address emerging health challenges. Historical experiences inform the development of effective interventions, policies, and programs, ultimately shaping the future of public health and improving population health outcomes.

Collecting and analyzing historical data is invaluable to public health nurses like Josh. Josh works in a neighborhood characterized by socioeconomic disadvantage, limited access to health care services, and various health disparities. The community faces multiple health challenges, including high rates of chronic diseases, substance use, mental health issues, and limited health literacy.

Josh recognizes the importance of evidence-based practice and the valuable insights that historical data can provide to guide his population's health initiatives. He collects historical data from various sources, including electronic health records, public health databases, and community surveys. He identifies vital health indicators such as prevalence rates of chronic diseases, immunization coverage, and social determinants of health. Josh carefully analyzes the data, looking for patterns, trends, and disparities across different populations. By disaggregating the data by demographic factors like age, gender, ethnicity, and socioeconomic status, he better understands health needs and disparities within the population. During Josh's engagement with community members, he identifies a level of mistrust of the public health system. Josh takes additional time to reflect on events from the past that may be influencing community members' attitudes and levels of fear and avoidance of the public health system.

Sustaining and Expanding Progress

As discussed in [Foundations of Public/Community Health](#), the United States has significantly improved health outcomes and promoted population health. Although progress has been made over the last decade in improving public health and health care outcomes, there are ongoing challenges to address, and future directions must focus on sustaining and expanding these gains.

- **Increased Life Expectancy:** Historically, life expectancy in the United States has risen steadily over the decades. Advances in medical treatments, public health interventions, and improvements in health care access have contributed to longer lifespans (Buxbaum et al., 2020). However, since 2015, the United States has seen a decline in life expectancy, primarily driven by the opioid epidemic and the COVID-19 pandemic. Additionally, life expectancy disparities persist across different demographic groups and geographic regions. For example, between 2020 and 2021, life expectancy among Native American and Alaska Native communities was shortened by 2 years, the largest drop of any demographic group (Klobucista, 2022).
- **Decline in Mortality Rates:** Mortality rates for significant causes of death, such as heart disease, stroke (Mensah et al., 2017), and certain cancers, have declined in the United States (National Institutes of Health [NIH], 2022a). The decrease in the incidence of certain diseases can be attributed to the progress in medical treatments, enhanced prevention strategies, and improved management of chronic illnesses. However, it is crucial to acknowledge that there are still racial and ethnic inequalities. For instance, from 2014 to 2018, the occurrence rates of bladder cancer decreased among non-Hispanic White, non-Hispanic Black, non-Hispanic Asian/Pacific Islander, and Hispanic men. However, rates increased among non-Hispanic American Indian and Alaska Native (AI/AN) men (NIH, 2022a). Additionally, increasing maternal morbidity and mortality rates disproportionately affect Black/African American and AI/AN women (National Academies of Sciences, Engineering, and Medicine [NASEM], 2021).
- **Reduction in Smoking Rates:** The prevalence of smoking in the United States has significantly decreased in recent decades. This decline can be attributed to comprehensive tobacco control policies, public health campaigns, and increased awareness about the harmful effects of smoking. In addition, reducing smoking has resulted in improved cardiovascular health and decreased smoking-related diseases (NIH, 2022b). Preventing smoking initiation among youth and young adults remains a challenge. Despite progress, some young individuals are still drawn to tobacco products due to factors like peer pressure, social influences, and aggressive marketing tactics by the tobacco industry. Smoking can be influenced by broader societal factors such as stress, mental health challenges, and socioeconomic disparities. Smoking rates continue to be higher among certain populations, including those with lower education levels and lower income. Addressing these

disparities requires targeted interventions and tailored approaches. Addressing these underlying issues is critical for effective smoking cessation efforts (Chaiton et al., 2016).

- **Vaccinations:** Vaccinations have led to a decline in vaccine-preventable diseases. Immunization efforts, including childhood vaccination programs and targeted campaigns for specific populations, have contributed to controlling and eliminating diseases such as smallpox ([Figure 35.3](#)). However, globally, coverage has plateaued over the last decade, with an estimated 25 million children under the age of 1 year not receiving essential vaccines in 2021, which is six million more children than before the beginning of the COVID-19 pandemic in 2019. Additionally, there were 18 million children who did not receive any vaccines, called “zero-dose,” which is the highest this number has been since 2005 (CDC, 2023).

FIGURE 35.3 Globally, childhood vaccination rates have plateaued over the last decade, with an estimated 25 million children under the age of 1 year not receiving essential vaccines, the highest number since before the start of the COVID-19 pandemic in 2019. (credit: “A Sailor gives a child a vaccine at the Angaur Community Center, Sept. 27, 2019” by Haley McMenamin/U.S. Marine Corps/Flickr, CC BY 2.0 DEED)

- **Advances in Medical Technology:** Advancements in medical technology have improved the diagnosis, treatment, and management of various health conditions in the United States. Innovations such as minimally invasive surgeries, precision medicine, telemedicine, and electronic health records have enhanced client care and health outcomes (Thomas, 2022). However, underserved communities face numerous challenges in accessing advanced medical technologies, including financial constraints, inadequate health care infrastructure, and the digital divide. The **digital divide** refers to the gap between individuals, communities, or groups who have access to and use digital technologies, such as computers, smartphones, and the internet, and those who do not. To ensure that everyone has equal access to quality health care, these challenges must be addressed. Additionally, culturally sensitive care and effective communication are essential to promote equitable health care for all (Saeed & Masters, 2021).
- **Expanded Health Insurance Coverage:** The ACA is a comprehensive U.S. health care reform law enacted in March 2010. It represents one of the most significant changes to the country’s health care system in recent history. Its primary goals were to increase access to health care coverage, improve the quality of care, and control health care costs. Although the ACA expanded health insurance coverage to millions of previously uninsured individuals and improved access to care, several gaps and challenges persist. For example, the ACA provides subsidies to help individuals and families afford health insurance, but some people, especially those with moderate incomes who do not qualify for subsidies, still face challenges affording premiums, deductibles, and other out-of-pocket costs.
- **Increased Access to Health Care Services:** Increased access has resulted in improved preventive care, early diagnosis, and management of chronic conditions (Antonisette et al., 2022). However, access to mental health

and substance misuse continues to be an issue. For example, although the ACA required insurance plans to cover mental health and substance use disorder services, barriers to accessing timely and comprehensive care and disparities in coverage still exist. Additionally, some rural areas still face challenges in accessing health care services due to limited provider availability, lack of specialists, and health care facility closures.

The ACA explicitly excluded undocumented immigrants from accessing its benefits, including health insurance marketplaces and Medicaid. This has resulted in a lack of coverage options for this population, which can lead to barriers in accessing timely and preventive care.

- **Health Equity Initiatives:** There has been a growing recognition of health disparities and efforts to address them. Initiatives focused on health equity aim to reduce differences in health outcomes across different racial, ethnic, and socioeconomic groups. This includes targeted interventions, community-based programs, and policy changes to address the social determinants of health (CDC, 2020). Despite efforts to improve access to care, barriers such as lack of insurance, geographic location, language barriers, and cultural factors continue to limit health care access for marginalized communities. Health equity initiatives often focus on health care delivery, but addressing the social determinants of health, such as income, education, housing, and employment, is crucial for achieving lasting improvements in health outcomes.

Challenges to Improving Health Outcomes

While progress has been made in improving U.S. health outcomes, several ongoing challenges and disparities contribute to differences in health outcomes among different populations. Efforts to improve health further will require investing in public health infrastructure (organizational structures and functions that support health equity), addressing social determinants of health, expanding access to health care, and promoting health equity for all populations (CDC, 2020). Looking ahead to the future, the United States is poised to confront significant health care challenges in the coming decade. These issues include access to care, health care disparities, an aging population, chronic illnesses, mental health, substance misuse, and a shortage of health care professionals. A comprehensive and collaborative approach that involves public health agencies, health care providers, policymakers, community organizations, and individuals is needed to address these challenges. Such collaboration will improve population health and promote equity in health care.

Access to Care

Despite expanding health insurance coverage through the ACA, some individuals and communities still need affordable health insurance. Lack of insurance can result in delayed or inadequate health care, leading to poorer health outcomes. Even with insurance coverage, individuals may face limitations in the services covered. Some plans may restrict specific treatments, medications, or procedures, creating barriers to accessing necessary care.

Health insurance plans often have networks of contracted health care providers. These networks may vary by state, and coverage may be limited to providers within a specific geographic area. When individuals travel or need care outside their insurance network's coverage area, they may face out-of-network costs or have limited access options. Individuals may also have limited access to certain specialists or health care facilities. Limited coverage networks can also restrict access to preferred health care providers or specialists, particularly in rural or underserved areas.

Rural communities often face challenges accessing health care due to distance, provider shortages, and limited infrastructure. This can lead to delayed or inadequate care, resulting in poorer health outcomes for rural populations. Attracting and retaining health care professionals in rural areas can be challenging, leading to a lack of health care providers. Limited transportation options can hinder individuals from reaching health care facilities, particularly in emergencies. Rural populations may have lower income levels and limited health insurance coverage, impacting their ability to afford health care services. Many rural communities have aging populations with unique health care needs, including chronic disease management and geriatric care (Teo et al., 2009). Improving rural health care requires strategic investments and innovations in nurse-led clinics, nurse-managed health centers, and mobile health care units to reach underserved areas. Public and community health nurses play a transformative role in enhancing the health and well-being of residents.

Administrative complexities, such as paperwork requirements, annual renewals, or frequent changes in coverage options, can act as barriers to obtaining and maintaining health insurance coverage. Individuals may find it challenging to navigate bureaucratic processes, leading to gaps in coverage or delays in accessing care. For some clients, limited health literacy and inadequate health education contribute to challenges in understanding and

navigating the health care system, making informed health decisions, and adopting healthy behaviors. Addressing health literacy gaps and promoting health education is essential for improving health outcomes.

Health Disparities and Social Determinants

Disparities in health outcomes exist across various demographic groups, including racial and ethnic minorities, low-income populations, rural communities, and marginalized groups such as members of the LGBTQIA+ community. The social determinants of health, such as socioeconomic status, education, access to health care, and structural racism, influence these disparities. Eliminating social inequities promotes social justice and creates a healthier environment for all. For example, maternal and infant health disparities persist, with higher rates of preterm birth, low birth weight, and infant mortality among certain racial and ethnic groups. Improving access to care, addressing social determinants of health, and promoting health equity are crucial in addressing these disparities.

Policy and legislative changes can address social determinants of health and promote health equity. This includes policies that reduce health disparities and improve health outcomes among marginalized populations. For instance, policies may target poverty reduction, education reform, affordable housing, and employment opportunities to address the root causes of health inequities. Legislation can also support programs and services targeting underserved communities and providing resources to address their unique health care needs. For example, the American Hospital Association (2016) considers these health care services essential to address health disparities:

- Primary care
- Psychiatric and substance use treatment services
- Emergency department and observation care
- Prenatal care
- Transportation
- Diagnostic services
- Home care
- Dentistry services
- A robust referral structure to provide all individuals in the community with access to the full spectrum of health care services

Policy and legislative changes are critical in driving population health improvements. They provide a framework for allocating resources, guiding health care delivery, and addressing systemic factors influencing health outcomes. By implementing effective policies and enacting supportive legislation, governments can create an environment that fosters better health for populations, promotes health equity, and addresses the social, economic, and environmental determinants of health.

Chronic Diseases

Chronic illnesses, such as heart disease, diabetes, and certain types of cancer, significantly impact overall health, mortality rates, and health care expenses. The aging population will undoubtedly lead to a surge in the need for health care to manage chronic diseases. The management and extensive care required for age-related health issues, including cardiovascular diseases, dementia, and diabetes, will pose a considerable challenge.

A crucial step in tackling the burden of chronic diseases is shifting attention toward prevention rather than treatment. This involves targeting risk factors, promoting healthy behaviors, and implementing early detection strategies to reduce the occurrence and impact of chronic conditions. The challenge lies in prioritizing this shift toward prevention and health promotion. Investing in preventive measures, such as promoting healthy lifestyles, early detection, and screening programs, can significantly reduce the burden of chronic diseases and enhance overall population health outcomes.

Regular screenings and early detection programs play a role in preventing and managing chronic diseases. These screenings help identify potential risk factors and detect diseases in their initial stages when they are more treatable. Examples of effective screening programs include mammograms for breast cancer, colonoscopies for colorectal cancer, and blood pressure checks for hypertension. The goal is to prevent the development of chronic diseases by creating supportive environments and enabling healthy choices. Adopting a preventive approach can impact entire populations, reducing health disparities and improving the overall health of communities.

Preventing chronic diseases requires a comprehensive approach that targets high-risk individuals, promotes health

among the general population, and creates supportive environments for healthy choices. This approach necessitates improving health care systems, public health initiatives, education, policy changes, and technological advancements at each of the three prevention levels: primary, secondary, and tertiary ([Table 35.2](#)).

Enhancing Primary Prevention

- Health Education and Promotion: Invest in widespread health education campaigns using innovative digital platforms, social media, and interactive apps to reach diverse populations and promote healthy lifestyles.
- Early Childhood Interventions: Focus on early childhood nutrition, education, and development to establish a strong foundation for lifelong health. Implement policies that ensure access to quality early childhood education and health care.
- Environmental Policies: Advocate for policies that improve air quality, promote physical activity, and encourage healthy eating by creating walkable communities, green spaces, and healthier food environments.

Strengthening Secondary Prevention

- Innovative Screening Technologies: Invest in advanced screening technologies that enable earlier detection of diseases with higher accuracy, reducing false positives and unnecessary interventions.
- Telehealth and Remote Monitoring: Utilize telehealth for remote monitoring of high-risk individuals, ensuring timely interventions and reducing the burden on health care facilities.
- Personalized Risk Assessment: Develop algorithms that use individual health data to identify personalized risk factors, enabling targeted early interventions.

Advancing Tertiary Prevention

- Home-Based Care: Expand home health care services and incorporate telemedicine to monitor and support clients with chronic conditions, reducing hospital readmissions.
- Palliative and Hospice Care: Increase access to high-quality palliative and hospice care services for individuals with advanced and terminal illnesses, focusing on improving their quality of life.
- Rehabilitation and Support Services: Invest in advanced rehabilitation technologies and therapies to help clients regain functionality and independence after surgeries or injuries.

TABLE 35.2 Preventing Chronic Diseases: Three Prevention Levels

Mental Health and Substance Use Disorders

As noted in [Caring for Populations and Communities in Crisis](#), the increasing number of individuals experiencing mental health and substance use disorders poses a challenge to the health care system. Mental illnesses, such as depression, anxiety disorders, bipolar disorder, and schizophrenia, are characterized as chronic diseases because they are typically long-term and persistent, impact an individual's daily functioning and quality of life, and require continual management (Park et al., 2008). Ongoing public health concerns include access to mental health care, the stigma associated with mental illness, and integrating mental health services within the broader health care system.

Improving mental health care requires a thorough approach that involves policy changes, increased funding, public education, and better access to care. Several strategies can be implemented, such as expanding insurance coverage for mental health services, providing supportive housing, increasing funding for mental health programs and workforce development, providing telehealth services to improve access, reducing stigma through education and awareness campaigns, and promoting integration between mental health and primary care services (Mental Health America, 2023).

The U.S. opioid epidemic is another persistent challenge. Prescription opioid misuse and overdose fatalities are widespread, and substance misuse issues, including alcohol and illegal drug use, pose significant risks to individuals and communities (Mental Health America, 2023). Community/public health nurses are on the front lines of responding to opioid overdoses.

Naloxone is used to rapidly reverse the effects of opioid overdose and is the standard treatment for overdose cases. To increase access to naloxone products, the U.S. Food and Drug Administration (FDA) has taken several measures, including approving a 4 milligram (mg) naloxone hydrochloride nasal spray for over-the-counter (OTC) and nonprescription use. This is the first naloxone product approved for use without a prescription (FDA, 2023). Nurses

working within community settings must be trained to administer naloxone (Narcan) and be prepared to provide immediate care to individuals who have overdosed. Ensuring timely access to naloxone and educating the community on its use is a necessity to prevent overdose deaths.

Community and public health nurses can conduct outreach programs and educational sessions to increase awareness about the availability of naloxone over the counter and the importance of calling 911 after administering the medication. Timely access to naloxone and educating the community on its use is crucial in preventing death from opioid overdoses. For example, using naloxone nasal spray on individuals dependent on opioids may result in severe withdrawal symptoms. These symptoms include body aches, diarrhea, increased heart rate, fever, runny nose, sneezing, goosebumps, sweating, yawning, nausea or vomiting, nervousness, restlessness or irritability, shivering or trembling, abdominal cramps, weakness, and increased blood pressure. Nurses must be prepared to handle and support these symptoms in a community setting. See [Table 35.3](#).

Challenges	Nursing Implications
Shift to Synthetic Opioids: As the opioid landscape changes, synthetic opioids like fentanyl are becoming more prevalent. These substances are highly potent and pose a higher risk of overdose (Drug Enforcement Administration, 2021).	Nurses must be aware of the latest opioid-use trends, including the rise of synthetic opioids. They should be trained to recognize the signs of opioid overdose and be prepared to administer naloxone (Narcan), an opioid reversal medication, as needed.
Access to Treatment and Recovery Services: Many individuals struggling with opioid use disorder face barriers in accessing treatment and recovery services due to limited availability, stigma, and financial constraints (AACN, 2021a).	Nurses can advocate for increased funding and resources for addiction treatment and recovery programs. They can also play a role in connecting individuals to available services, providing education about treatment options, and offering support throughout the recovery process.
Co-occurring Mental Health Disorders: Opioid use disorder often co-occurs with mental health disorders such as depression and anxiety, making treatment more complex (Substance Abuse and Mental Health Services Administration, 2023).	Nurses should be skilled in assessing both substance use disorders and mental health conditions. Integrated care that addresses both aspects of a client's health is crucial for effective treatment.
Neonatal Abstinence Syndrome (NAS): Pregnant individuals who use opioids can give birth to babies with NAS, which requires specialized care (AACN, 2021a).	Nurses caring for pregnant individuals with opioid use disorder must collaborate closely with obstetricians, neonatologists, and addiction specialists to provide comprehensive care that supports the parent's well-being and the newborn's health.
Stigma and Discrimination: Stigma surrounding opioid use disorder can hinder individuals from seeking help and can affect their overall well-being.	Nurses should provide nonjudgmental, compassionate care to individuals with opioid use disorder, focusing on reducing stigma and creating a safe environment where clients feel comfortable discussing their needs.
Harm Reduction Strategies: Harm reduction approaches, such as supervised injection sites and needle exchange programs, are debated but may be essential in preventing overdose deaths and the spread of infections (Thakkar et al., 2020).	Nurses can be advocates for harm reduction strategies, engaging in public health discussions, educating communities about their benefits, and supporting initiatives that provide safe spaces for substance use.

TABLE 35.3 Challenges and Nursing Implications of the Opioid Epidemic (See Mental Health America, 2023.)

Challenges	Nursing Implications
Interdisciplinary Collaboration: Addressing the opioid epidemic requires collaboration across health care disciplines, law enforcement, public health agencies, and community organizations (The Overdose Response Strategy, 2018).	Nurses are well-positioned to serve as advocates and leaders in interdisciplinary teams. They can foster communication and cooperation among various partners to develop comprehensive prevention, treatment, and recovery strategies.
Education and Prevention: Educating the public, health care professionals, and policymakers about the risks of opioid misuse, proper pain management, and available resources is essential to curb the epidemic (AACN, 2021a).	Nurses can engage in public awareness campaigns, educate clients and families about safe medication use, and participate in policy discussions to promote evidence-based opioid prescribing practices.

TABLE 35.3 Challenges and Nursing Implications of the Opioid Epidemic (See Mental Health America, 2023.)

Addressing these challenges and disparities requires a multi-faceted approach that includes improving access to health care, addressing social determinants of health, promoting health equity, expanding preventive services, and investing in public health infrastructure. Collaboration among health care providers, policymakers, community organizations, and individuals is needed to create meaningful, sustainable change (Mental Health America, 2023).

Health Care Workforce Shortages

The scarcity of health care professionals, including doctors, nurses, and allied health workers, will escalate in the coming years. A **workforce shortage** arises when the availability of skilled workers in a specific location at the required time is inadequate to meet the target audience's demands (Lopes et al., 2015). These shortages could easily overload the health care system's ability and significantly restrict health care access, particularly in underprivileged regions. It is, therefore, imperative to boost the health care workforce, enhance recruitment and retention efforts, and explore innovative care delivery models to address this pressing issue.

According to the Association of American Medical Colleges (AAMC) (2021), the United States will face a shortage of up to 124,000 physicians by 2034. A workforce analysis of registered nurses (RNs) projects a shortage throughout the United States through 2030. The analysis shows that almost 30 states will face a significant deficit of RNs (American Association of Colleges of Nursing [AACN], 2022). California, Florida, and Texas will have the highest shortage in terms of RN job numbers. In contrast, New Mexico, Arizona, and Nevada will have the most substantial shortages based on the ratio of RNs per 100,000 individuals. Massachusetts and South Dakota are the only states projected to show an RN surplus in 2030 (Juraschek et al., 2019; World Health Organization [WHO], 2023).

Shortages in the health care workforce can result from factors such as demographics, education, training, work environment, and economics. The aging population significantly contributes to the increased demand for health care services, as older individuals need more medical care and chronic disease management. The limited number of qualified educators can create a bottleneck in education, leading to fewer health care professionals (AACN, 2021b). Shortages are usually more prominent in specific specialties or geographic locations, resulting in disparities in access to care (AAMC, 2021). High-stress environments and heavy workloads can cause burnout and attrition among health care professionals. Public health emergencies can also strain health care systems, leading to workforce shortages as health care professionals face increased demands (NASEM, 2019).

The nursing shortage can lead to errors and higher morbidity and mortality rates. In medical facilities with a high client-to-nurse ratio, nurses often experience burnout and dissatisfaction, and clients face increased mortality and failure-to-rescue rates compared to facilities with lower ratios. Although a few states have implemented laws to limit client-to-nurse ratios, when staffing is insufficient, ratios tend to rise to meet demand (Haddad et al., 2023).

The COVID-19 pandemic revealed a lack of adequate public health infrastructure and workforce in several regions (Pittman & Park, 2021). The decline in RNs employed in clinic- and non-clinic-based community/public health jobs undoubtedly impacted the lack of a public health workforce. Clinic-based jobs fell from 3.5 percent (76,127) in 2000 to 1.6 percent (53,084) in 2018. At the same time, non-clinic-based community/public health jobs dropped from 3.2 percent (69,837) in 2000 to just 1.4 percent (47,226) in 2018 (Pittman & Park, 2021). [Figure 35.4](#) illustrates the drop in employment among RNs working in community and public health sectors.

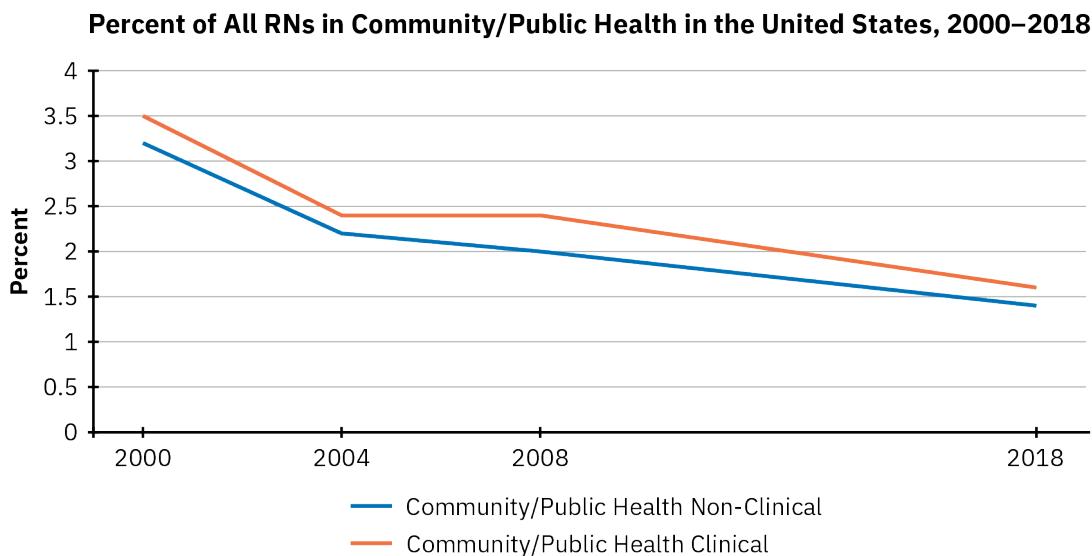

FIGURE 35.4 This graph demonstrates the drops in employment among RNs working in community public health sectors. (data source: National Center for Health Workforce Analysis, 2018; attribution: Copyright Rice University, OpenStax, under CC BY 4.0 license)

Diversity in the nursing workforce is crucial for effective health care delivery. Recruiting and retaining nurses from diverse backgrounds, including different races, ethnicities, cultures, genders, sexual orientations, and socioeconomic statuses, can help establish client trust and enhance cultural competency, ultimately reducing health care disparities. Per the U.S. Census Bureau, nursing supply and demand aligns with demographic changes in the population. Notably, there has been a significant increase in the supply of Hispanic nurses, meeting the demand for nursing care for Hispanic clients among both registered nurses (RNs) and licensed practical nurses (LPNs) (Health Resources and Services Administration, 2017).

THE ROOTS OF HEALTH INEQUITIES

The Need for a More Diverse Nursing Workforce

The lack of diversity in the nursing workforce can lead to disparities in health care access, quality, and outcomes for marginalized and underserved populations, contributing to health inequities. This is especially true for underrepresented minority groups facing poorer health and higher mortality rates.

- A diverse nursing workforce is crucial for providing culturally competent care that considers diverse client populations' unique needs, beliefs, and practices.
- Clients from marginalized communities often have higher trust in health care providers who share their cultural backgrounds and experiences.
- A diverse nursing workforce can help bridge language gaps between clients and health care providers, improving communication and understanding.
- Diverse nursing teams provide a broader perspective on client needs and experiences, leading to more client-centered care.
- Nursing professionals from diverse backgrounds can advocate for policies that address health disparities and promote health equity.

(See AACN, 2023.)

35.2 Leading Initiatives to Transform Health Systems to Reduce Health Inequities

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 35.2.1 Describe leadership behaviors that foster the attainment of health equity.
- 35.2.2 Describe technology's role in transforming care in public and community health practice.
- 35.2.3 Identify initiatives for reshaping community and public health practice.
- 35.2.4 Describe what population health will look like in the future.

By demonstrating certain leadership behaviors, nurses can create equitable health care environments, reduce health disparities, and improve health outcomes for all individuals and communities. In addition, they play a vital role in advocating for health equity and inspiring others to pursue equitable health care for all. This section considers nurses' roles as leaders, explores technology's role in transforming public and community health, examines three initiatives that are reshaping public and community health care, and imagines what population health will look like in the future.

Leadership Behaviors That Foster Health Equity

This text has emphasized social justice and health equity. Nurse leaders have an opportunity and an obligation to lend their skills as scientists, innovators, advocates, and educators to lead efforts to advance health equity for all (Azar, 2021). A nurse leader does not have to be in a position of authority; instead, they can carry an informal role of influence. For example, nurses can act as role models by embodying equity, inclusivity, and cultural competence principles. They can demonstrate respectful and compassionate care for all individuals regardless of their backgrounds or social determinants of health. By modeling inclusive behavior, nurses inspire others to follow suit. Nurses can lead initiatives to ensure the nursing staff receives ongoing training and education in cultural humility and sensitivity and advocate for language services and interpreter services to ensure effective communication and understanding. [Table 35.4](#) demonstrates how nurses, as informal leaders, can use their influence and expertise to improve the population's health. Refer to additional strategies presented in [Advocating for Population Health](#) and [Engagement in the Policy Development Process](#) for specifics.

Practice Focus	Application
Practice advocacy	<ul style="list-style-type: none"> • Advocate for evidence-based practice that promotes health equity and social justice. • Ensure care is sensitive, respectful, and inclusive. • Advocate for changes within health care systems to eliminate bias and discrimination, promote equitable access to care, and address social determinants of health.
Client advocacy	<ul style="list-style-type: none"> • Advocate for individual clients, ensuring they receive equitable, respectful, and culturally appropriate care. • Empower clients to participate in their care decisions, educate them on health disparities, and address barriers to accessing health care services. • Advocate for clients. • Contribute to improved health outcomes and equity in care delivery.
Policy engagement	<ul style="list-style-type: none"> • Actively engage in local, regional, and national policy discussions. • Join nursing organizations, participate in policy committees, and collaborate with policymakers to influence health care policies that promote social justice and health equity. • Provide expertise and advocate for policies that address health disparities, support vulnerable populations, and prioritize health equity. • Write letters and communicate with local, state, and national representatives.

TABLE 35.4 Examples of How Nurses Can Impact the Population's Health

Practice Focus	Application
Research and evidence generation	<ul style="list-style-type: none"> Contribute to research that explores social justice issues and health equity. Inform policy development and drive change by generating evidence on the impact of policies, interventions, and practices on population outcomes. Participate in interdisciplinary research teams to ensure a holistic approach to addressing health disparities. Nurse leaders utilize data to identify health disparities and inform decision-making processes. Collect, analyze, and disseminate data on health outcomes, social determinants of health, and health care disparities. Use this information to identify priority areas, track progress, and develop evidence-based health interventions.
Education and mentorship	<ul style="list-style-type: none"> Serve as educators and mentors to future generations of health care professionals. Incorporate social justice and health equity topics into nursing curricula, ensuring students understand the underlying determinants of health disparities and their importance. Engage in ongoing professional development to enhance their knowledge and skills related to health equity. Stay up-to-date on current research, evidence-based practices, and emerging trends in health care disparities. Seek learning and professional growth opportunities to advance their leadership in promoting health equity.
Collaborative partnerships	<ul style="list-style-type: none"> Foster collaborations with other health care professionals, community organizations, advocacy groups, and policymakers to address social justice and health equity. Leverage collective expertise, share resources, and develop innovative solutions to tackle systemic issues contributing to health disparities. Build collaborative partnerships with health care providers, community organizations, and other concerned parties to identify barriers and develop strategies to improve access to care, resources, and health promotion initiatives. Engage clients and communities in decision-making by ensuring community members are represented in designing, implementing, and evaluating health care services. Encourage open dialogue, seek feedback, and effectively incorporate client and community perspectives to address health disparities.

TABLE 35.4 Examples of How Nurses Can Impact the Population's Health

Technology's Role in Transforming Care in the Public and Community Health Practice

Technology has revolutionized public health by improving health data collection, analysis, and sharing. Electronic records, data analytics, and digital surveillance systems have enabled faster responses to outbreaks and other health threats. Telehealth and mobile health apps have expanded access to health care services and facilitated remote monitoring and self-management ([Figure 35.5](#)). Integrating digital tools into health care delivery can enhance population health and the factors that impact health outcomes, including medical care. COVID-19 has highlighted the significance of integrating technology into health care delivery (Abernethy et al., 2022).

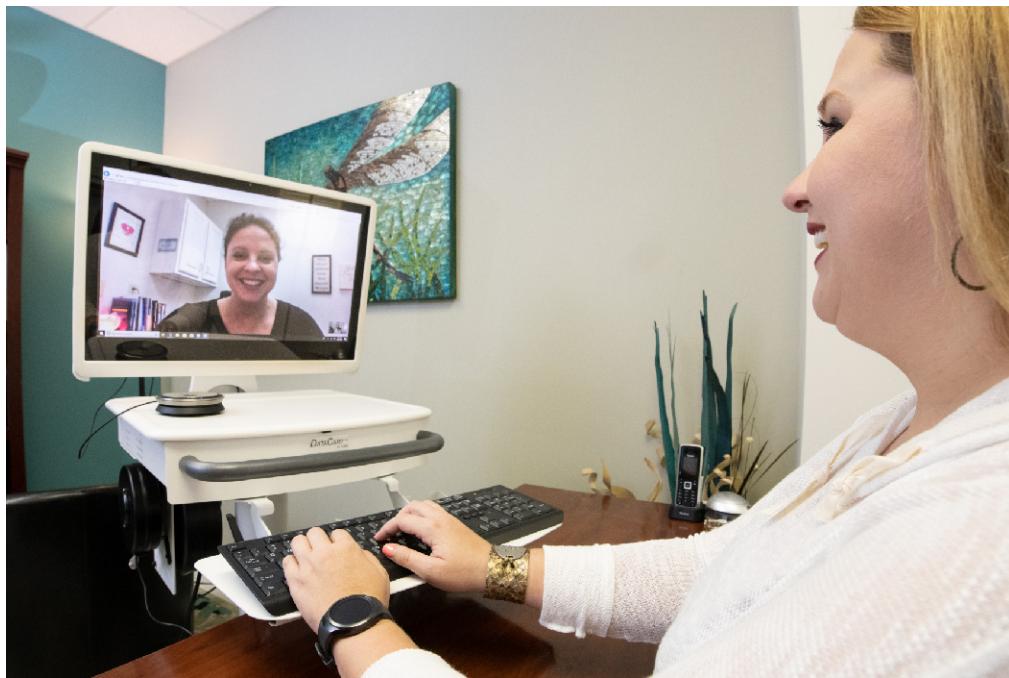

FIGURE 35.5 Telemedicine makes virtual visits with clients who live in rural areas or who lack access to transportation possible. This photo shows a licensed professional mental health counselor meeting with a client. (credit: Lance Cheung/USDA/Flickr, Public Domain)

Technology will continue to shift care from hospital-centric care to community-based care. This transition is driven by the potential to improve client outcomes, reduce health care costs, and enhance the overall well-being of individuals by leveraging technology's capabilities for remote monitoring, education, early intervention, and data-driven decision-making. [Table 35.5](#) outlines current and emerging technological advancements that will continue to influence care delivery.

Current and Emerging Technology	Application	Nurse's Role & Responsibilities
Telehealth and telemedicine	Virtual visits, remote monitoring, and teleconsultations enable health care professionals to provide care and support remotely.	Nurses must understand telehealth platforms to assist in client education and ensure effective communication during virtual visits. Nurses play a role in developing telehealth systems and new virtual care models (Booth et al., 2021) and develop competency to deliver care using remote technology (AACN, 2021a).
Electronic health records (EHRs)	EHR systems allow health care providers to store and access client information electronically.	Nurses are responsible for maintaining ERH records and ensuring accurate and up-to-date client data is available to the entire care team. Nurses play a role in developing low-cost devices and software and promoting integration with existing mobile, internet, and other digital technologies (Booth et al., 2021).
Wearable health devices	Devices like smartwatches and fitness trackers can monitor various health metrics such as heart rate, sleep patterns, and activity levels. Wearable data can be incorporated into the plan of care to help improve client outcomes (Bowe et al., 2023).	Nurses can assist clients in understanding how to use these devices and the data generated and provide context for its significance.
Internet of medical things (IoMT)	The internet of medical things (IoMT) integrates medical devices and wearables with internet connectivity for remote monitoring, real-time data collection, and better communication between clients and health care providers (Junaid et al., 2022).	Nurses can utilize this information to track vital signs, medication adherence, and health behaviors, providing essential information for personalized care and early intervention.
Mobile health apps	Many mobile apps are focused on health management, medication reminders, and chronic disease management.	Nurses can recommend suitable apps to clients, provide guidance on using them, and interpret the information generated.
Artificial intelligence (AI)	AI has the potential to analyze large data sets, diagnose medical conditions, predict outcomes, and personalize treatment plans while eliminating inefficiencies in clinical workflows. This branch of computer science has many subfields striving to mimic human intelligence (Tiase & Cato, 2021).	Nurses must understand their role in collaborating with AI systems to enhance decision-making and client care. Nurses should take responsibility for advocating for policies needed on professional accountability in using AI (Booth et al., 2021).

TABLE 35.5 Current and Emerging Technologies Designed to Complement and Enhance Client Care, and the Nurse's Role

Current and Emerging Technology	Application	Nurse's Role & Responsibilities
Robotics	Technological advancements have led to the development of robots as potential partners in nursing to supplement understaffing and provide efficient health care for people with disabilities, older adults, and vulnerable individuals (Clancy, 2020; Khan et al., 2020; Miyagawa et al., 2020; Soriano et al., 2022). Robots can assist with medication delivery, client transportation, and even surgery.	As robotics becomes more involved in health care delivery, nurses will need to evaluate their proficiency and expand their role to ensure health care robots' safe and empathetic functioning (Soriano et al., 2022).
Genomic medicine	Genomic medicine uses an individual's genomic information in clinical care for diagnosis or treatment decisions, impacting oncology, pharmacology, rare/undiagnosed diseases, and infectious disease outcomes and policies (National Human Genome Research Institute, 2020). Genetic advances have led to personalized medicine based on individuals' genetic makeup.	Nurses can educate clients about genetic testing, help them understand the results, and support decision-making (Booth et al., 2021).
Augmented reality (AR), virtual reality (VR)	AR and VR technologies are used in various areas, from medical training to pain management, to supplement the real world with virtual objects and transform client education from static text-based material to interactive website-based systems (Adapa et al., 2020).	Nurses must ensure that AR and VR incorporate evidence-based client teaching materials, considering health literacy, vision, hearing, and cultural sensitivity (AACN, 2021a).
Internet of Things (IoT)	IoT is “a self-configuring and adaptive system consisting of networks of sensors and smart objects whose purpose is to interconnect ‘all’ things, including everyday and industrial objects, in such a way as to make them intelligent, programmable, and more capable of interacting with humans” (Laplante et al., 2018). IoT devices can connect medical equipment and enable real-time data monitoring and analysis. For example, “smart beds” can detect when they are occupied and when a client tries to get up, sending this information to nurses via the network/internet (Babu & Jayashree, 2015).	In planning IoT health care applications, nurses and engineers must collaborate to combine domain expertise and technological insights to benefit clients and providers (Laplante et al., 2018).
Workflow management software	Workflow management software can aid in improving client safety and reduce documentation or data access time. These tools can help nurses manage tasks, assignments, and schedules, optimizing their daily workflow and ensuring that client care tasks are timely.	Nurses must ensure that the software aligns with their workflow, ultimately enhances decision-making, and improves client care quality.
Smart homes	Homes equipped with sensors and wearable devices can track vital signs, activity levels, and health metrics. This data can be sent to health care providers in real time for remote client monitoring. Smart homes can help remind occupants to take their medications and perform other health-related tasks, as well as detecting falls or unusual movements.	In collaboration with family members, nurses can use this technology to tailor care decisions, such as supporting older adults with memory problems to remain in their homes (Booth et al., 2021).

TABLE 35.5 Current and Emerging Technologies Designed to Complement and Enhance Client Care, and the Nurse's Role

THE FUTURE OF HEALTH CARE

[Access multimedia content \(<https://openstax.org/books/population-health/pages/35-2-leading-initiatives-to-transform-health-systems-to-reduce-health-inequities>\)](https://openstax.org/books/population-health/pages/35-2-leading-initiatives-to-transform-health-systems-to-reduce-health-inequities)

This short video introduces far-reaching changes that will transform every facet of health care.

Watch the video, and then respond to the following questions.

1. What is a digital twin? How can a digital twin be used to promote health?
2. Describe how precision medicine impacts care.
3. How will AI-powered decision models be used?
4. What is anticipatory health care?

Nurses are responsible for ensuring that technology facilitates efficient, safe, client-centered care delivery (Booth et al., 2021). Nurses must respect their clients' values and uphold technology's ethical and safe use. To achieve this, nurses can implement the following strategies:

- Educate clients about the benefits, risks, and potential implications of using specific technologies in their care. This empowers clients to make informed decisions based on their values and preferences.
- Ensure clients provide informed consent before implementing a new technology or procedure involving technology. This involves explaining the purpose, procedures, potential benefits, and potential risks.
- Consider clients' cultural, religious, and personal values when integrating technology into their care plans. Tailor the technology used to align with clients' unique needs.
- Respect the client's autonomy and explore alternative care options if a client chooses not to use certain technologies due to personal beliefs.
- Promote transparency by explaining how client data will be used, stored, and shared using technology. Clients should be aware of how their privacy is being safeguarded.
- Ensure that communication is secure and protected to maintain client confidentiality.
- Advocate for concerns within the care team. Collaborate with other health care professionals to find solutions that align with clients' values.
- Use technology to empower clients to take an active role in their care decisions.
- Establish channels for clients to provide feedback on their technology experiences. This feedback can drive improvements and enhance client-centered technology solutions.
- Remain updated on technological advancements and ethical considerations related to health care technology to guide clients effectively.
- Join groups and organizations focusing on health care technology ethics to gain valuable insights and resources.

Initiatives for Reshaping Community and Public Health Practice

A variety of initiatives are reshaping public and community health care by emphasizing prevention, community engagement, and care coordination and addressing the social determinants of health. These initiatives aim to improve health outcomes, enhance access to care, and promote equity in health care delivery by focusing on holistic and client-centered approaches. This section examines three initiatives: community-based participatory research, Health in All Policies, and community health workers.

Community-Based Participatory Research

Community-based participatory research (CBPR) involves collaborative research partnerships among community members, researchers, and public health practitioners. This approach ensures that communities are actively involved in the research process, from identifying research questions to interpreting and disseminating findings. CBPR helps to address community priorities, build trust, and promote sustainable interventions (Agency for Healthcare Research and Quality [AHRQ], 2020).

At the core of CBPR lies collaboration, highlighting the significance of partnerships between researchers and community members. This approach recognizes communities' immense knowledge and expertise regarding their health concerns. CPBR highly values community engagement and empowerment, involving community partners in

all phases of the research process. Community members are active participants, co-researchers, and co-implementers of interventions. The ultimate goal of CBPR is to empower communities to take charge of the research process and use the findings to advocate for change and enhance their health outcomes (AHRQ, 2020).

CBPR is committed to producing actionable outcomes that lead to positive change in the community. It aims to translate research findings into interventions and policies that address community health concerns. CBPR considers sustainability, ensuring that research efforts have a lasting impact and support long-term improvements in community health (AHRQ, 2020).

In conducting community-based participatory research, ethical considerations are given the utmost importance, such as respecting community autonomy, cultural sensitivity, and informed consent and protecting human subjects. Adherence to ethical guidelines and protocols ensures the welfare and rights of all participants.

The research process has been extensively utilized in public health, health care, and social sciences to tackle health inequities, advance community health outcomes, and promote health equity. CBPR aims to create culturally appropriate, contextually relevant knowledge and significantly impact communities' health and well-being by involving community members as active partners (AHRQ, 2020).

THEORY IN ACTION

Community-Based Participatory Research

[Access multimedia content \(<https://openstax.org/books/population-health/pages/35-2-leading-initiatives-to-transform-health-systems-to-reduce-health-inequities>\)](https://openstax.org/books/population-health/pages/35-2-leading-initiatives-to-transform-health-systems-to-reduce-health-inequities)

This short video illustrates a collaborative approach to conducting CBPR.

Watch the video, and then respond to the following questions.

1. Define community-based participatory research.
2. How does the CBPR approach promote shared power?

Health in All Policies

Health in All Policies (HiAP) seeks to incorporate health considerations into policymaking across various sectors and government agencies. As described in [Engagement in the Policy Development Process](#), HiAP is “a collaborative approach that integrates and articulates health considerations into policymaking across sectors to improve the health of all communities and people” (CDC, 2016a). It recognizes that health outcomes are influenced by various social, economic, and environmental factors extending beyond the health care sector. HiAP aims to ensure that health is considered and integrated into decision-making processes and policies at all levels of government.

HiAP emphasizes addressing health inequities and the underlying SDOH, given that health disparities often stem from unequal access to resources, opportunities, and power. HiAP strongly encourages collaboration among various sectors, including health care, education, transportation, housing, environment, and agriculture. This approach recognizes that addressing SDOH requires a comprehensive, coordinated effort. When these sectors work together, they can align policies, strategies, and actions to promote health and well-being. HiAP aims to address the social, economic, and environmental factors contributing to health inequities and achieve equitable health outcomes for all populations. HiAP stresses integrating health impact assessments, epidemiological data, and research findings into policy development processes, as evidence and data are crucial to informing policymaking (CDC, 2016b).

Collaboration between community and public health nurses and professionals from various sectors and government agencies is crucial for promoting HiAP. By engaging in intersectoral partnerships, community and public health nurses can work with policymakers, community organizations, schools, transportation departments, and housing authorities, and other concerned parties to advocate for policies that address social determinants of health. Community and public health nurses can provide expertise on health promotion, disease prevention, and community needs to inform policy discussions. They can also support the implementation of health impact assessments (HIAs), which evaluate the potential health effects of proposed policies, plans, and projects across different sectors. Nurses can contribute their understanding of local health needs, data, and community perspectives to ensure that HIAs are comprehensive and reflect the specific community context. Additionally, they

can collect and analyze data on health outcomes, SDOH, and the impact of policies on population health to provide evidence for the effectiveness of HiAP interventions. HIA and HiAP are policy tools that include health considerations in decision-making processes across sectors such as transportation, education, criminal justice, and equity (Rogerson et al., 2020). By sharing this evidence with partners, the community, and public health, nurses can advocate for evidence-based policy changes that promote healthier communities.

Public health nurse Josh can use the data analysis he performed to identify areas within his community to be the focus of intervention. For example, the data revealed a high prevalence of obesity and related chronic conditions, and Josh has identified significant health disparities and inequities, with limited health care, education, and healthy food options characterizing the community. Josh's examination of interventions attempted in the past reveals that traditional approaches to improving health have not been sufficient and decides to adopt the HiAP framework to address the underlying social determinants of health.

Josh works with the local government and initiates a HiAP team to promote cross-sector collaboration involving representatives from various health, transportation, housing, education, and urban planning departments. Regular meetings and working groups facilitate communication, collaboration, and information sharing. This collaboration ensures that health considerations are integrated into policy discussions across sectors. The HiAP team collects and analyzes a wide range of data related to health outcomes, social determinants of health, and existing policies.

The HiAP team identifies critical health indicators, disparities, and areas where policy interventions can significantly impact health equity. This data-driven approach provides the necessary evidence to guide policy development and implementation. The HiAP team reviews existing policies and identifies opportunities for alignment with health goals. They identify policies that have the potential to impact health determinants, such as transportation infrastructure, affordable housing, access to parks and recreation, and healthy food options. The team works with relevant departments to integrate health considerations into policy development, ensuring that decisions prioritize health equity.

The HiAP team establishes mechanisms to assess the impact of policies on health outcomes and health equity. They track vital indicators, collect data, and evaluate the effects of policy changes on various population groups. This evaluation process helps to identify successes, challenges, and areas for improvement. The findings are shared with policymakers and community partners to inform future decision-making processes.

The local government actively engages with the community throughout the HiAP process. They conduct community consultations, focus groups, and public hearings to ensure that community members' voices are heard and their health needs are considered in policy development.

Community feedback and perspectives are integrated into policy decisions to ensure relevance and responsiveness to local needs. Through the implementation of HiAP, the city government has witnessed several positive outcomes and impacts. Policies and interventions are designed and implemented with health equity in mind, resulting in improved access to health care services, increased availability of healthy food options, enhanced public transportation systems, and revitalized neighborhoods. Health disparities begin to narrow, and community members report improved health outcomes and a sense of well-being.

IMPLEMENTING A HIAP APPROACH IN A LOCAL COMMUNITY

Community and public health nurses can work with community members to implement a Health in All Policies (HiAP) approach to address health disparities and promote well-being in the chosen community.

- Step 1: Community Selection
 - Choose a local community you are personally connected to or are interested in working with.
 - Consider demographics, health disparities, existing policies, and community resources when selecting your community.
- Step 2: Understanding the Situation
 - Research and gather data on the health issues affecting your chosen community.
 - Analyze the social determinants of health that contribute to these issues.
 - Identify existing policies, programs, and partners related to health and well-being in the community.

- What are the key health issues affecting the community?
- How are social determinants of health contributing to these health issues?
- Step 3: Identifying Partners
 - Who are the key groups in the community who should be involved in a HiAP approach?
 - How can you engage community members, local businesses, and other sectors to collaborate?
- Step 4: Policy Analysis
 - What are the current policies that might impact the health and well-being of the community?
 - Which policies might inadvertently contribute to health disparities or unequal access to resources?
- Step 5: Developing a HiAP Strategy
 - How can you unite diverse sectors such as housing, transportation, education, and health care to address health disparities collaboratively?
 - What strategies could you use to advocate for policy changes prioritizing health and well-being?
- Self-Reflection
 - How do your values and cultural background influence the way you work with diverse communities?
 - What challenges might you face in navigating cultural differences and engaging various partners in the HiAP process?
 - How can you ensure the HiAP approach is inclusive and respects the community's cultural diversity?

Community Health Workers

As introduced in [Implementation and Evaluation Considerations](#), **community health workers** (CHWs) are essential public health workers who serve as a critical link between communities, health care systems, and state health departments. CHWs are trusted liaisons between the health care system and its communities. They provide culturally appropriate education, outreach, and support to individuals and families, particularly those facing health care difficulties. They significantly enhance health literacy, facilitate care coordination, and promote preventive health behaviors (CDC, 2022).

For example, CHWs conduct community outreach activities to connect individuals with health care resources and services. They may assist community members in navigating the health care system, scheduling appointments, completing paperwork, accessing insurance coverage, and understanding their rights and responsibilities. CHWs provide emotional support, encourage self-advocacy, and help individuals overcome barriers to health care access (CDC, 2022).

As collaborators with health care providers and other community organizations, the CHW facilitates care coordination for individuals with complex health needs. They help individuals understand their treatment plans, adhere to medications, and navigate the health care system. CHWs also make referrals to resources, such as social services, mental health providers, substance misuse treatment programs, and support groups (CDC, 2022).

CHWs serve as advocates for the health needs of their communities. They raise awareness of health disparities, promote policy changes to address social determinants of health, and engage in community organizing activities. CHWs empower community members to participate in decision-making that actively affects their health and well-being (CDC, 2022).

Community and public health nurses frequently collaborate with CHWs, offering training, supervision, and assistance. This partnership enables public health agencies to utilize CHWs' cultural proficiency, valuable insights, and strong community ties to develop targeted interventions, enhance health care accessibility, and tackle health disparities effectively. When these groups work together, public health efforts can have a broader reach and more significant impact, ensuring that interventions are tailored to meet the specific needs of the communities they serve.

Some states require certification or training for CHWs, which may be implemented by the Department of Health, Department of Public Health, Department of Human Services, board of nursing, or third-party entities. Certification is often necessary for reimbursement, and some CHWs view it as a tool for career advancement, while others may not see it as necessary for their role or community connection (Rural Health Information Hub, 2023).

COMMUNITY HEALTH WORKER SAW ME AS HUMAN

[Access multimedia content \(<https://openstax.org/books/population-health/pages/35-2-leading-initiatives-to-transform-health-systems-to-reduce-health-inequities>\)](https://openstax.org/books/population-health/pages/35-2-leading-initiatives-to-transform-health-systems-to-reduce-health-inequities)

This short video introduces Magdalena, a client at Loma Linda University Health's Diabetes Treatment Center. She was depressed and immobile, having difficulty navigating the complex health system—but a community health worker was able to help.

Watch the video, and then respond to the following questions.

1. Describe the role of community health worker.
2. How does a community health worker bridge the gap in care?
3. How might a population health nurse work with a community health worker?

Public health nurses like Josh recognizes CHWs as a critical link between communities, health care systems, and state health departments. Josh advocates for funding to support hiring a CHW to serve the county. Josh and CHW Tawana conduct a comprehensive needs assessment to identify the health needs and concerns of the community. They engage community members through surveys, interviews, and focus groups to understand their specific challenges, cultural beliefs, and preferences. Based on the findings, Josh and Tawana developed a joint plan that aligns with the community's priorities and addresses the identified health issues.

They collaborate to design and deliver health education programs tailored to the community's needs. They also develop culturally sensitive materials and workshops on chronic disease prevention, healthy lifestyle choices, and disease management. The CHW is vital in bridging cultural and language barriers, ensuring the information is accessible and relatable to community members.

Josh and Tawana work together to reach out to community members, particularly those who are underserved or face barriers to health care access. They conduct home visits, organize community health fairs, and partner with local organizations and faith-based groups. Their combined efforts raise awareness about available health care resources, facilitate access to services, and empower community members to take control of their health. Josh leverages his clinical expertise to develop care plans, provide health assessments, and offer specialized services. Meanwhile, Tawana serves as a trusted advocate, assisting with appointment scheduling and medication management and connecting individuals to social services. Together, they ensure continuity of care and support for individuals throughout their health journey.

Josh and Tawana regularly evaluate the effectiveness of their collaborative efforts. They track key indicators, such as health care utilization rates, client satisfaction, and health outcomes. By analyzing the data, they identify areas of improvement, make necessary adjustments to their interventions, and measure the impact of their work on community health. The collaborative work of Josh and Tawana yields several positive outcomes and impacts in the community. Through their joint efforts, they increase health literacy and empower individuals to make informed decisions about their health. The collaborative approach also strengthens community engagement, fosters trust, and promotes cultural competence in health care delivery. As a result, community members experience improved health outcomes, reduced health disparities, and a sense of empowerment and ownership over their well-being.

Population Health in the Future

To provide optimal care for populations, nurses must continue meticulously monitoring crucial metrics such as mortality and morbidity rates, vaccination rates, and lifestyle habits, including smoking, physical activity, and nutrition. This enables them to accurately assess their clients' overall health status and quality of life.

With the rise of data analytics, nurses will collaborate with health care professionals, researchers, policymakers, and community leaders to develop comprehensive population health approaches. They will use data to identify health trends, allocate resources, and customize interventions to specific populations.

Addressing SDOH, such as socioeconomic status, education, and housing, will become crucial to enhancing overall population health outcomes. Nurses must reduce health disparities by addressing inequalities in health care access and outcomes among different population groups, utilizing technology for remote monitoring, telehealth, and health

education, promoting health literacy, and empowering individuals to actively manage their health.

Nurses must consider genetic, environmental, and lifestyle factors when planning interventions for effective population health strategies. Additionally, they will be called upon to advocate for policies promoting a healthier environment in response to climate change influencing client health status and safety.

Addressing mental health disparities and promoting mental wellness will gain more prominence in population health initiatives. Public and community health nurses will lead the way in improving the health and well-being of residents in rural communities. They will work across borders to address global health challenges and promote health equity worldwide.

Community and public health nurses will continue prioritizing health promotion, disease prevention, and education with health care technology enhancing their role. However, hospital-centered care will shift to community-based care, improving client outcomes, reducing costs, and enhancing well-being through remote monitoring, education, early intervention, and data-driven decision-making.

Overall, the future of nursing in the community will be characterized by a proactive, technology-driven, client-centered, and collaborative approach. Community nurses will work as educators, advocates, and health partners, striving to improve the health and well-being of diverse populations and promote equitable access to care.

CASE REFLECTION

The Future of Population Health Nursing

Read the scenario, and then respond to the questions that follow.

Tania is a registered nurse working in a community health center who has observed significant changes in her role and responsibilities, with a growing emphasis on population health. Tania is curious about nurses' evolving role in addressing the health needs of diverse populations and the challenges and opportunities associated with this shift.

1. What are the key metrics that nurses like Tania should monitor to assess the overall health status and quality of life for populations?
 2. How can data analytics enhance the role of nurses in population health initiatives? What are the potential benefits of data-driven approaches?
 3. What are some of the social determinants of health that nurses should address when working on population health? How can they reduce health disparities among different population groups?
 4. How can technology, such as remote monitoring and telehealth, be leveraged by nurses to promote health literacy and empower individuals to manage their health actively?
 5. How can nurses consider genetic, environmental, and lifestyle factors when planning population health interventions? Provide examples of how these factors can impact health outcomes.
 6. How might climate change influence client health status and safety, and how can nurses advocate for policies to respond to this challenge?
 7. How can nurses address mental health disparities and promoting mental wellness within populations?
 8. How might rural communities benefit from the leadership of public and community health nurses? What challenges may they face in these settings?
 9. How is health care evolving from hospital-centered care to community-based care, and what are the potential advantages of this shift for client outcomes and costs?
 10. What approaches, roles, and responsibilities will define the future of nursing in the community?
-

35.3 Carving a Path Forward

LEARNING OUTCOMES

By the end of this section, you should be able to:

- 35.3.1 Explain the importance of population health in nursing education and practice.
- 35.3.2 Discuss ways to transform nursing practice to provide diverse populations safe, quality, and equitable care.
- 35.3.3 Describe how nurses may lead change to advance health across the continuum from public health prevention to disease management of populations.
- 35.3.4 Discuss the key to achieving positive health outcomes.

The nursing workforce must be prepared to rise to the challenge of adapting to changing health care and social support systems. With the increasing demand for nurses and the need for diverse and intensive nursing care across multiple settings, nurses must be equipped to address the negative impacts of social determinants of health on well-being (NASEM, 2021). The American Association of Colleges of Nurses (AACN) recognizes the importance of population health in nursing education and practice. AACN promotes and supports the integration of population health concepts and competencies into nursing curricula to prepare nurses to address the health needs of diverse populations. According to AACN (2021a), population care requires proficiency in six core areas as outlined in [Table 35.6](#).

Competency	Proficiency
Manage population health	<ul style="list-style-type: none"> • Define a target population, including its functional and problem-solving capabilities, throughout the continuum of care. • Assess population health data. • Assess the community's priorities and the affected clinical population. • Compare and contrast local, regional, national, and global benchmarks to identify health population health patterns. • Apply an understanding of the public health system and its interfaces with clinical health care in addressing population health needs. • Develop an action plan to meet an identified need(s), including evaluation methods. • Participate in the implementation of sociocultural and linguistically responsive interventions. • Describe general principles and practices for the clinical management of populations across the age continuum. • Identify ethical principles to protect the health and safety of diverse populations.
Engage in effective partnerships	<ul style="list-style-type: none"> • Engage with other health professionals to address population health issues. • Demonstrate effective collaboration and mutual accountability with relevant parties. • Use culturally and linguistically responsive communication strategies.
Consider the socioeconomic impact of the delivery of health care	<ul style="list-style-type: none"> • Describe access and equity implications of proposed intervention(s). • Prioritize safe, effective, and efficient client-focused and community action plans in the context of available resources.

TABLE 35.6 The Six Core Areas of Population Health Proficiency (See AACN, 2021a.)

Competency	Proficiency
Advance equitable population health policy	<ul style="list-style-type: none"> • Describe policy development processes. • Describe the impact of policies on population outcomes, including social justice and health equity. • Identify the best evidence to support policy development. • Propose modifications to or development of policy based on population findings. • Develop an awareness of the interconnectedness of population health across borders.
Demonstrate advocacy strategies	<ul style="list-style-type: none"> • Articulate a need for change. • Describe the intent of the proposed change. • Define interested parties(stakeholders), including members of the community and clinical populations, and their level of influence • Implement messaging strategies appropriate to the audience and other interested parties. • Evaluate the effectiveness of advocacy actions.
Advance preparedness to protect population health during disasters and public health emergencies	<ul style="list-style-type: none"> • Identify changes in conditions that might indicate a disaster or public health emergency. • Understand the impact of climate change on environmental and population health. • Describe the health and safety hazards of disasters and public health emergencies. • Describe the principles and methods regarding personal safety measures, including personal protective equipment (PPE). • Implement infection control measures and proper use of personal protective equipment.

TABLE 35.6 The Six Core Areas of Population Health Proficiency (See AACN, 2021a.)

Population care requires the nurse to be prepared to promote health and prevent disease across the health care continuum, including public health, community health, acute care, ambulatory care, and long-term care. Population health also encompasses collaborative activities among all relevant individuals and organizations involved in care, including clients and communities, to improve a population's health status (AACN, 2021a).

To deliver safe, equitable, and high-quality care to diverse client populations, nursing practice must prioritize a holistic approach that considers clients in the context of their families and communities. This involves recognizing how social, political, and economic factors impact health, focusing on what is most essential for well-being, fostering a compassionate and healing relationship, and always upholding personal dignity, choice, and meaning (AACN, 2021a).

Transforming Nursing Practice

The [Future of Nursing 2020–2030](https://openstax.org/r/namedu) (<https://openstax.org/r/namedu>) report by the National Academies of Sciences, Engineering, and Medicine (2021) has identified several crucial areas where the nursing profession must improve to overcome the challenges of the next decade. These areas include the nursing workforce, leadership, nursing education, nurse well-being, emergency preparedness and response, and the nursing profession's responsibilities concerning the determinants of health at both the structural and individual levels. [Table 35.7](#) highlights the obstacles that need to be addressed to achieve health equity in the next decade. The ultimate goal is to achieve health equity in the United States, which can be accomplished by strengthening nursing capacity and expertise.

Area for Improvement	Challenges
Addressing systematic issues	<ul style="list-style-type: none"> Systemic issues such as poverty, discrimination, and unequal distribution of resources can hinder progress toward health equity. Addressing these structural barriers is complex and requires policy changes. Disparities in health care access and outcomes, often linked to socioeconomic factors, remain significant challenges. Closing these gaps necessitates systemic changes and increased resources. Socioeconomic disparities in health information access and health literacy can impede clients' ability to make informed decisions about their care. Efforts should be made to bridge this gap. Access to technology and health care infrastructure can be limited in certain areas, hindering the adoption of telehealth and other advancements in health care delivery. Bias and discrimination within health care systems can affect clients' quality of care. Efforts to combat bias and promote culturally competent care are essential.
Lifting barriers to expand the contributions of nursing	<ul style="list-style-type: none"> A shortage of health care professionals, including nurses, hinders achieving health equity. Addressing this requires investments in education, training, and incentives to retain nurses in underserved areas. Twenty-seven states restrict practice for advanced practice nurses (APRNs), limiting care for complex needs. There is a need to eliminate state-level regulations and grant full practice authority to nurse practitioners. Institutional barriers limit APRNs, RNs, and LPNs from practicing to their full education and training.
Designing better payment models	<ul style="list-style-type: none"> Current payment systems need improvement to address social needs and promote health equity. Health care organizations can adopt new payment models to address social needs and drive forward health equity.
Strengthening nursing education	<ul style="list-style-type: none"> Nursing students must have the necessary knowledge and skills to promote health equity, reduce health inequalities, and improve the population's overall well-being. This can be achieved through coursework and hands-on learning experiences that expose them to different care environments, such as community settings (e.g., schools, workplaces, home health care, and public health clinics) and telework.
Valuing community and public health nursing	<ul style="list-style-type: none"> Promoting health equity is a critical responsibility of community and public health nurses. With the onset of the COVID-19 pandemic, the significance of team-based care, infection control and prevention, person-centered care, and other population-based skills has been underscored, highlighting the capabilities of community and public health nurses.
Fostering nurses' roles as leaders and advocates	<ul style="list-style-type: none"> The nursing profession requires a new generation of leaders who prioritize diversity and equity and recognize the crucial link between social determinants of health and overall health status. Nurse leaders can also play a critical role in addressing the legacy of racism in health care and the nursing profession and taking steps to reduce the negative impact of discrimination and implicit bias on clients' health outcomes.

TABLE 35.7 Areas for Improvement and Corresponding Obstacles to Achieve Health Equity in the Next Decade (See NASEM, 2021.)

Area for Improvement	Challenges
Preparing nurses to respond to disasters	<ul style="list-style-type: none"> • The COVID-19 pandemic has highlighted the divisions in an already fractured U.S. health care system, causing a significant increase in mortality and illness rates and exposing stark health disparities. • The communities most severely impacted are people of color, who face the combined challenges of discrimination, financial hardship, dangerous work environments, restricted health care access, and preexisting medical issues. • It is crucial to define the responsibilities and duties of nurses in disaster response and public health emergency management to enhance the country's ability to prepare for and react to such occurrences.
Supporting the health and well-being of nurses	<ul style="list-style-type: none"> • The workplace demands placed on nurses can significantly impact their well-being, compromising the quality and safety of their care. • To prevent burnout and poor health among nursing staff, it's crucial to address the root causes of workplace hazards and stressors. • Ultimately, the impact on nurses' health and well-being goes beyond their personal lives, directly affecting the quality, safety, and cost of care and the overall health care system.

TABLE 35.7 Areas for Improvement and Corresponding Obstacles to Achieve Health Equity in the Next Decade (See NASEM, 2021.)

Social Responsibility as a Global Citizen

The role of nurses as global citizens goes beyond providing local health care. Nurses must embrace their responsibility to contribute to positive global health outcomes, promote health equity, and address global health challenges. Nurses are prepared to interact with populations from around the world. Being culturally competent and sensitive allows nurses to provide care that respects cultural beliefs, practices, and values. Global citizenship in nursing involves advocating for equal access to quality health care for all individuals regardless of their geographical location, socioeconomic status, or cultural background. Nurses can advocate for policies that address health disparities and promote health equity globally. They also promote global health by educating individuals and communities about disease prevention, hygiene, nutrition, and healthy lifestyles. This knowledge can have a positive impact on public health outcomes worldwide. Additionally, nurses are often at the forefront of responding to disasters and humanitarian crises around the world, providing emergency medical care, supporting displaced populations, and delivering essential health care services.

Global citizenship encourages nurses to collaborate with health care professionals and policymakers across borders, fostering international partnerships that facilitate knowledge-sharing, capacity-building, and skill-sharing projects. Nurses can contribute to global health by participating in educational initiatives and training programs in underserved areas such as third-world communities, helping to strengthen health care systems and empower local health care professionals ([Figure 35.6](#)). They can also engage in global public health initiatives, such as promoting sanitation, safe drinking water, and hygiene practices to prevent spreading infectious diseases. Above all, nurses must prioritize the well-being of clients and communities, even in challenging and resource-limited environments.

FIGURE 35.6 This global health initiative by the CDC educates men in Mozambique about voluntary medical male circumcision (VMMC) at a health clinic. (credit: “VMMC in Mozambique” by Ricardo Franco/CDC/Flickr, CC BY 2.0 DEED)

Nurses must continuously learn about and adapt to global health issues, emerging diseases, and evolving health care practices. They should advocate for health equity, promote global health initiatives, collaborate internationally, and provide health care services in diverse settings to improve global health outcomes.

Key to Achieving Positive Health Outcomes

Population health covers public health, acute care, ambulatory care, and long-term care for local, regional, national, and global communities. It involves collaboration between individuals and organizations involved in care, including clients and communities, with a focus on achieving health equity and improved health for all and an emphasis on diversity, equity, inclusion, and ethics. Everyone involved shares accountability for outcomes, as various factors can influence the health of a specific group. Ultimately, a population health perspective is essential in promoting the health and well-being of the community (AACN, 2021a).

Population health encompasses a broad range of health care services, from public health initiatives aimed at preventing diseases to managing the health of entire communities. Population health management involves systems thinking and incorporating health promotion and illness prevention to achieve population health goals.

Nurses advocate for and implement policies that impact population health on a global and local level, and they respond to emergencies, crises, epidemics, or pandemics. This requires a particular focus on surveillance, prevention, and containment of factors contributing to the emergency, with competencies tailored to each situation.

A skilled community/public health nurse carries out many essential functions in community organizations or state and local public health organizations. These functions range from providing clinical services, home visits, and population-based services to conducting health promotion programs at all levels of prevention. The community/public health nurse works directly with at-risk populations, using their population-level competencies to provide services to individuals, families, or groups. Additionally, they perform critical tasks such as primary data collection and analysis, fieldwork, program planning, outreach activities, programmatic support, and other organizational tasks. Although their focus is primarily on population-level competencies and community/public health, nurses apply these skills and competencies across all levels of prevention, making them indispensable members of the health care infrastructure (Quad Council Coalition Competency Review Task Force, 2018).

Community and public health nurses hold the key to achieving positive health outcomes in an era of increasing challenges. By working together and fostering a culture of inclusivity, nurses can create a society where everyone has equal access to health care and can attain their best possible state of wellness.

Chapter Summary

35.1 Learning from the Past to Guide the Future

Nurses can draw insights from past public health achievements. Nurses have been instrumental in spearheading endeavors to enhance client well-being and medical outcomes and will continue to shape the trajectory of health care.

35.2 Leading Initiatives to Transform Health Systems to Reduce Health Inequities

Nurse leaders can play an important role in promoting health equity. They can serve as role models for inclusivity and cultural competence and can create a

more inclusive and equitable health care system by inspiring others to embrace compassionate care and by advocating for ongoing training in cultural sensitivity and language services.

35.3 Carving a Path Forward

Nurses collaborate to promote health and prevent disease. Nursing practice should prioritize a holistic approach that considers the client's family and community context; recognizes the social, political, and economic factors that affect health; prioritizes well-being; fosters compassionate relationships; and respects personal dignity and choice.

Key Terms

community health workers (CHWs) essential public health workers who link communities, health care systems, and state health departments

community-based participatory research (CBPR) collaborative research partnerships between community members, researchers, and public health practitioners

digital divide the gap between those who have ready access to and use digital technologies, such as computers, smartphones, and the internet, and those who do not

Health in All Policies (HiAP) an approach that seeks

to incorporate health considerations into policymaking across various sectors and government agencies

internet of medical things (IoMT) integrates medical devices and wearables with internet connectivity for remote monitoring, real-time data collection, and communication between clients and health care providers

workforce shortage arises when the availability of skilled workers is inadequate to meet the target audience's needs

Review Questions

1. A community/public health nurse is organizing an outreach program to educate the community on the availability of over-the-counter naloxone. Which response by a community member indicates to the nurse that the person understands the indication for naloxone?
 - a. "Naloxone is a long-term treatment for opioid addiction."
 - b. "Naloxone prevents opioid cravings in individuals with substance use disorders."
 - c. "Naloxone is used to rapidly reverse the effects of an opioid overdose."
 - d. "Naloxone is a preventive medication to reduce the risk of opioid misuse."

2. A community health nurse has been assigned to develop health promotion and disease prevention interventions for the local community. Which of the following is an example of a primary prevention?
 - a. Scheduling mammogram screenings for uninsured women
 - b. Assessing medication adherence during home visits
 - c. Offering free breakfasts to school-age children
 - d. Instructing clients with arthritis how to modify their home to decrease the risk of falls

3. A nurse is advocating for policies that create walkable communities, green spaces, and healthier food environments. Which level of prevention does this target?
 - a. Primary prevention
 - b. Secondary prevention
 - c. Tertiary prevention
 - d. Quaternary prevention

4. A nurse working in a community health clinic is caring for a middle-aged client who is being seen for a routine check-up. The nurse assesses the clients' vital signs, height, and weight and performs point-of-care glucose and cholesterol tests. After reviewing the results with the provider, the client is identified as being at an increased risk for developing diabetes. Which level of prevention does this visit reflect?
 - a. Primary
 - b. Secondary
 - c. Tertiary
 - d. Quaternary
5. A community health nurse who lobbies for the local transit system to add additional bus routes between a low-income neighborhood and the local clinic is demonstrating which type of leadership behavior?
 - a. Education and mentorship
 - b. Client advocacy
 - c. Policy engagement
 - d. Practice advocacy
6. Which action will the nurse take to ensure the ethical and safe use of a mobile health app by a client who needs help in managing their medications?
 - a. Clarifying for the client the potential risks and benefits of this technology
 - b. Ensuring that this technology will protect the client's confidentiality
 - c. Explaining that this is the only way to monitor the client's medication regimen
 - d. Reinforcing that this technology will reduce the time the nurse needs to monitor the client
7. Which of the following is the best example of a Health in All Policies approach?
 - a. The local health department plans to expand its services to additional locations in the community.
 - b. A school system expands its school nursing staff to offer more services to students.
 - c. The nurse helps a manufacturing plant collaborate with the local health system to expand its employee assistance program.
 - d. The nurse lobbies community leaders to collaborate with the transportation board to add sidewalks and bike paths to road maintenance projects.
8. Which of the following actions would improve health care access for clients?
 - a. Shifting health care reimbursement models to focus on health promotion initiatives
 - b. Implementing strategies to address health care provider burnout
 - c. Expanding a team-based approach to health care
 - d. Allowing advanced practice nurses full practice authority in all 50 states
9. A community health nurse works in a clinic that treats clients who lack insurance and have a history of opioid use disorder. Which of the following approaches should the nurse use when working with these clients?
 - a. The nurse should treat these clients the same as other clients.
 - b. The nurse should recognize these clients are at high risk for having symptoms related to both mental illness and substance use disorders.
 - c. The nurse should focus only on the client's physical needs related to the opioid use disorder.
 - d. The nurse should discourage the use of harm reduction approaches such as needle exchange programs and help the client focus on eliminating their drug use.
10. A nurse is conducting a health promotion campaign aimed at reducing smoking rates in a community with a high prevalence of smoking among teenagers and young adults. Which intervention is more likely to be effective with this population?
 - a. Distributing informational pamphlets about the harmful effects of smoking
 - b. Hosting a community event for families to raise awareness about the dangers of smoking
 - c. Implementing a social media campaign that discourages smoking
 - d. Providing financial incentives to teens who quit smoking

APPENDIX A

Assessment Tools

The following [Evidence-Based Resources](https://openstax.org/r/healthgovhealtha) (<https://openstax.org/r/healthgovhealtha>) are tools that will help population health, public health, and community health nurses effectively engage in public health practice. These tools are intended to guide clinicians in various aspects of community assessment. All community health initiatives should be in alignment with the goals of Healthy People 2030.

1. Windshield Surveys: The first step in community assessment is an overview of the community, commonly called a windshield survey. The following resource from the Community Tool Box provides information on conducting a [windshield survey](https://openstax.org/r/ctbkuedu) (<https://openstax.org/r/ctbkuedu>).
 - a. Community asset mapping offers a visual representation of the community. Key steps in this process are to identify the community assets, such as the human, social, cultural, financial, political, and environmental aspects related to health promotion. Key steps include the following:
 - i. Defining community boundaries
 - ii. Identifying and involving people and organizations with shared interests
 - iii. Determining what assets to include
 - iv. Listing the assets of various community groups and individuals
 - v. Organizing these assets on a map
 - b. Several tools are available to measure the social determinants of health:
 - i. Instructions on how to begin to map a community are available in this [Mapping Community Assets Workbook](https://openstax.org/r/digitalcommons) (<https://openstax.org/r/digitalcommons>), which provides definitions and strategies to include in the mapping of a community.
 - ii. The [Neighborhood Atlas](https://openstax.org/r/neighborhoodatlas) (<https://openstax.org/r/neighborhoodatlas>) offers mapping of disadvantaged areas within specific census blocks in each U.S. county, called the Area Deprivation Index (ADI).
2. The American Hospital Association's Community Health Assessment Toolkit provides hospitals and health systems with a nine-step guide on how to best collaborate with communities and strategic partners to meet the requirements of the community served. This toolkit was revised following the COVID-19 pandemic to reflect a strong commitment to racial and social justice. It provides a visual representation of the nine-step process and details each step of a community health assessment. Specific elements of the toolkit are available at the [Community Health Assessment Toolkit](https://openstax.org/r/healthycommunitiesa) (<https://openstax.org/r/healthycommunitiesa>).
3. The Centers for Disease Control and Prevention (CDC) [Public Health Professionals Gateway](https://openstax.org/r/cdcgovpublic) (<https://openstax.org/r/cdcgovpublic>) offers various resources to conduct a community health needs assessment and initiate change.
4. The University of Kansas has developed a [Community Toolbox](https://openstax.org/r/ctbkuedue) (<https://openstax.org/r/ctbkuedue>) that helps community-based nurses to:
 - assist in defining the root cause of community issues,
 - set priorities,
 - develop a plan for community assessment,
 - generate solutions to community-based problems,
 - conduct a SWOT analysis,
 - use a logic model to create effective change, and
 - evaluate the [effectiveness of change](https://openstax.org/r/ctbkuedua) (<https://openstax.org/r/ctbkuedua>).
5. Health statistics to aid community health nurses in community-based assessments are publicly available:
 - Centers for Disease Control and Prevention: [National Center for Health Statistics](https://openstax.org/r/cdcgovnchshus) (<https://openstax.org/r/cdcgovnchshus>)
 - [County Health Rankings and Roadmaps](https://openstax.org/r/countyhealthrankingsa) (<https://openstax.org/r/countyhealthrankingsa>)

- U.S. Census Bureau: [Census data \(https://openstax.org/r/censusgov\)](https://openstax.org/r/censusgov), community demographics to help guide decision-making
 - U.S. Census Bureau: [QuickFacts \(https://openstax.org/r/censusgovqu\)](https://openstax.org/r/censusgovqu), the most recent up-to-date information on U.S. census data
6. In 1994, Wright and Leahy developed the Calgary Family Intervention Model to assess and develop knowledge, skills, and competencies in three categories: structural, developmental, and functional. This tool is used to design education and improve overall client and family outcomes.
- Wright, L. M., & Leahey, M. (1994). Calgary Family Intervention Model: One way to think about change. *Journal of Marital and Family Therapy, 20*, 381–395. <https://doi.org/10.1111/j.1752-0606.1994.tb00128.x>
 - The Calgary Intervention Model has been used in the community in various populations to improve client and family outcomes: Sari, A., & Duman, Z. (2022). Effects of the family support and psychoeducation program based on the Calgary Family Intervention Model on the coping, psychological distress, and psychological resilience levels of the family caregivers of chronic psychiatric clients, *Archives of Psychiatric Nursing, 41*, 1–10. <https://doi.org/10.1016/j.apnu.2022.07.014>
 - Nursing students may use the Calgary Family Intervention Model to perform a family unit assessment to identify the family's interaction within the subsystems (e.g., parent-child or marital) or the interactions between the family and to the larger units within the community, such as health care professionals, schools, and community organizations. By using elements of the model, nursing students can assess the structural, developmental, and functional components and identify opportunities at the family level and formulate interventions to positively impact family functioning. Depending on the assessment, nursing interventions may involve improving available resources or improving the coping ability of the family related to the acute or chronic illness of one of its members.
7. The [intervention wheel \(https://openstax.org/r/healthstatemn\)](https://openstax.org/r/healthstatemn) (IW) provides a visual representation of the specialty of public health nursing, as it provides a framework to facilitate 17 public health nursing intervention practices according to the level of practice (individual/family, community, system) and the level of the intervention.

The intervention wheel has been utilized by many countries due to its direct applicability to nursing public health practice. The IW identifies 17 interventions, organized by five distinct wedges in distinct colors, and identifies three levels of practice: systems focused, community focused, and individual focused. The IW identifies nursing activities in each of the five colored wedges at each of the three levels of practice.

The colors of the wheel represent various public health interventions:

- Red wedge: Surveillance, disease and health event investigation, outreach, screening, and case finding
- Green wedge: Referral and follow-up, case management, and delegated functions
- Blue wedge: Health teaching, counseling, and consultation
- Orange wedge: Collaboration, coalition building, and community organizing
- Yellow wedge: Advocacy, social marketing, and policy development and enforcement

Public health nurses and nursing students can use the intervention wheel to establish targeted health services at various levels of practice and specific intervention levels.

For example, in one area of the country, it was determined that the rate of colorectal cancer was nearly twice that of the rest of the United States. The red wedge in the intervention wheel (surveillance, disease and health event investigation, outreach, and screening at the community and systems level as well as case finding at the individual level) was used to identify a specific American Indian tribe with a particularly high rate of colorectal cancer. A public health nurse and a nursing student partnered with a company to offer free colorectal cancer screenings for the tribe to investigate the reasons for the high rates of cancer and to identify those in the early stages, thereby reducing cancer mortality rates.

Nurses and nursing students have identified specific uses for the intervention wheel that are relevant to geriatric care, child health, school health, and primary care in the context of public health. For example, a

team of nursing students and nurses used the wheel to assess food security concerns among people over the age of 65 with disabilities during the COVID-19 pandemic. Using the IW, the team identified concerns in this population surrounding loneliness and isolation and assembled community-based interventions to address this isolation and loneliness (Shaffer et al., 2022).

Recent publications that outline how the intervention wheel has been used in practice include the following:

- Anderson, L. J. W., Schaffer, M. A., Hiltz, C., O’Leary, S. A., Luehr, R. E., & Yoney, E. L. (2018). Public health interventions: School nurse practice stories. *The Journal of School Nursing*, 34(3), 192–202. doi:10.1177/1059840517721951
- Leahy-Warren, P., Day, M. R., Philpott, L., Glavin, K., Gjevjon, E. R., Steffenak, A. K. M., Egge, H., & Mulcahy, H. (2018). A falls case summary: Application of the public health nursing intervention wheel. *Public Health Nursing*, 35(4), 307–316. doi:10.1111/phn.12408
- Schaffer, M., Strohschein, S., & Glavin, K. (2022). Twenty years within public health intervention wheel: Evidence for practice. *Public Health Nursing*, 39, 195–201. https://doi.org/10.1111/phn.12941
- Schoon, P. M., Porta, C. M., & Schaffer, M. A. (2019). *Population-based public health clinical manual: The Henry Street model for nurses* (3rd ed.). Sigma Theta Tau International Society of Nursing.

8. [Loyola University](https://openstax.org/r/hsdlucedu) (<https://openstax.org/r/hsdlucedu>) has created an interprofessional list of national and state-level resources.
9. The World Health Organization (WHO) developed [The Health Impact Assessment \(HIA\)](https://openstax.org/r/whointhe) (<https://openstax.org/r/whointhe>).

This tool is designed to evaluate the impact of a policy, project, or program on populations, especially those who are disadvantaged or vulnerable. The HIA helps decision-makers discern the best improvements to prevent injury or disease and to actively promote population health.

The HIA is based on four values:

- Democracy
- Equity
- Sustainable development
- Ethical use of evidence

10. The EveryONE Project by the American Academy of Family Physicians developed the [Social Needs Screening Tool](https://openstax.org/r/aafporgfamily) (<https://openstax.org/r/aafporgfamily>). The EveryONE Project tool addresses the social determinants of health within communities and includes an assessment of the following social determinants of health:
 - Housing
 - Food
 - Transportation
 - Utilities
 - Childcare
 - Employment
 - Education
 - Finances
 - Personal Safety

APPENDIX B

Community/Public Health Nursing [C/PHN] Competencies

The core competencies of public health nursing are defined as the fundamental knowledge, skills, and attitudes that a person holds that allow for growth and success and guide all public health professionals. The definition and practice of public health nursing were updated in 2013 to address the evolving trends in the U.S. economy as well as the changing landscape of health practices, politics, and society.

According to public health professionals, the key elements of public health nursing practice include a focus on population-based health care needs with attention to many of the social determinants of health (SDOH), a comprehensive and systematic approach to assess populations with an emphasis on preventative strategies, and key interventions at the level of individuals, families, communities, countries, and across the globe.

American Association of Colleges of Nursing (<https://openstax.org/r/aacnnursing>)

The American Association of Colleges of Nursing (AACN) defines a population as a “discrete group that the nurse and others care for across settings at local, regional, national, and global levels.”

The AACN defines nursing competencies for managing the health of populations at the level of the entry-level nurse as well as for advanced practice nurses, called The Essentials.

American Nurses Association

The American Nurses Association (ANA) has defined the scope and standards for public health nursing. The ANA has published the third edition of its scope and standards for public health nursing, available for [purchase at this link](#) (<https://openstax.org/r/nursingworldor>).

American Public Health Association (<https://openstax.org/r/aphaor>)

The American Public Health Association defines public health practice and public health nursing in its official statement.

Quad Council Coalition of Public Health Organizations

The Quad Council Coalition of Public Health Organizations was founded in 1988 to provide a united voice for the specialty of public health nursing practice. The coalition represents the joint efforts of the Alliance of Nurses for Healthy Environments (AHNE), the Association of Community Health Nursing Educators (ACHNE), the Association of Public Health Nurses (APHN), and the American Public Health Association – Public Health Nursing Section (APHA-PHN).

A thorough description of the Quad Council Coalition competencies is available at Quad Council Coalition Competency Review Task Force (2018) [Community/Public Health Nursing Competencies \(<https://openstax.org/r/cphnoor>\)](#).

These competencies are defined as the combination of observable and measurable knowledge, skills, abilities, and personal attributes that contribute to enhanced employee performance and ultimately result in organizational success. Core competencies are detailed in three tiers.

- Tier 1 competencies are those performed by the generalist public health nurse.
- Tier 2 competencies apply to public health nurses involved in management activities.
- Tier 3 competencies apply to public health nurses in executive or senior management roles.

The core competencies are described by the Quad Council within the following eight domains:

1. Assessment and analytic skills
2. Policy development/program planning skills

3. Communication skills
4. Cultural competency skills
5. Community dimensions of practice skills
6. Public health sciences skills
7. Financial planning
8. Evaluation and management skills
9. Leadership and systems thinking skills

For example, assessment and analytic skills are included as competencies in domain 1 for the entry-level public nurse and include the following:

1A1: Assessing the health status and health literacy of individuals and families, including determinants of health, using multiple sources of data.

1A2a: Use of an ecological perspective and epidemiological data to identify health risks for a population.

1A2b. Identifying individual and family assets, needs, values, beliefs, resources and relevant environmental factors.

1A3. Selecting variables that measure health and public health conditions.

1A4. Using a data collection plan that incorporates valid and reliable methods and instruments for collection of qualitative and quantitative data to inform the service for individuals, families, and a community.

1A5. Interpreting valid and reliable data that impacts the health of individuals, families, and communities to make comparisons that are understandable to all who were involved in the assessment process.

The Council on Linkages between Academia and Public Health Practice

The Council on Linkages between Academia and Public Health Practice is a collaborative formed by 24 national organizations, including the American Nursing Association (ANA). This council developed core competencies for public health professionals in 2021. The core competencies were developed in eight domains that include specific responsibilities at three levels: front line, program management, and senior management. Complete mapping of these competencies is [available at this link \(https://openstax.org/r/phfor\)](https://openstax.org/r/phfor). The eight domains are as follows:

1. Data Analytics and Assessment Skills
2. Policy Development and Program Planning Skills
3. Communication Skills
4. Health Equity Skills
5. Community Partnership Skills
6. Public Health Sciences Skills
7. Management and Finance Skills
8. Leadership and Systems Thinking Skills

For public health nurses seeking to build their competencies through graduate education with a master's degree, [this link provides \(https://openstax.org/r/publichealthdegr\)](https://openstax.org/r/publichealthdegr) important considerations regarding the roles and competencies of the public health practitioner, a public health physician, and a public health nurse.

Community-Based Participatory Research: In order to engage and collaborate with communities, specific competencies include the following (adapted from <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9219558/>):

1. Involving community partners as members of the research team when identifying the research problem
 - For example, public health nurses may request discussion of a health concern at a city chamber of commerce meeting.
2. Collaborating with the community during the creation of a study design as well as implementation to ensure accordance with local values and challenges
 - When planning to assess a community, respected local leaders in the community can provide clarity in how to best access individuals, families, and sub-communities.
3. Building upon strengths and challenges in the community to help build capacity within the community as well the opportunities for the researcher

- This competency may involve identifying and accessing current community organizations in order to build a coalition.
4. The researchers and community partners convening to plan how a community-based health initiative will be disseminated and communicated to relevant audiences within the community served
- While flyers in local restaurants may be helpful, some communities may be better accessed through local television or a particular form of social media.

APPENDIX C

Theories and Models Applicable to Practice

Nurse scholars have developed theories of nursing to define the profession and guide data collection and interpretation using a structured approach. The use of theory when planning nursing care guides the nurse in planning effective interventions and connects theory to nursing practice and research. Historically, many nurse theorists sought an individual approach to change. Theorists in public health take a broader approach, including the social, economic, and environmental factors that impact the development of health problems at the population, community, or family levels. For example, when planning care for a community that treats a high percentage of children with asthma in the local school systems, an individual approach would include specific medications to treat symptoms and planning for self-care. However, a broader perspective may consider how symptoms may be linked to environmental factors, such as allergens or irritants, as well as the quality of housing (e.g., the presence of pet dander, rugs, food additives, cigarette or cigar smoke, fragrances, temperature, humidity, dust mites or cockroaches, or air pollution).

C.1 Relevance of Theories and Models

Population health nurses use theory to plan and implement care at the family, local, regional, or national level. For example, a public health nurse may work within a local community to assess a virus outbreak in a school, while a nurse epidemiologist might assess a communicable disease incidence in a larger population. This appendix reviews a sample of nursing theories related to the individual, family, community, and population levels of care.

C.2 Nursing Theories at the Individual Level

While community-based models generally focus on the family, community, and population levels of care, serious illness care programs are often driven by the goals and priorities of the person directly affected and their family. Therefore, [Table C1](#) in this section includes individual-level theories. Services should be culturally and linguistically responsive, and careful attention must be paid to social risks such as poverty, mental illness, insecure housing, food, and transportation, which create unique challenges, as do past or present traumatic events. Comprehensive assessments at the individual level offer insight into collaboration with colleagues and community partners.

Theorist/ Year	Focus	Concepts	Nursing's Role
Orem's Self-Care Deficit 1971	Nursing care is required if a client cannot fulfill biological, psychological, developmental, or social needs.	<p>Assumes that people can exert purposeful control over their environments in the pursuit of health.</p> <p>Three related constructs:</p> <ol style="list-style-type: none"> 1. Theory of self-care (dependent care) 2. Theory of self-care deficit 3. Nursing systems <p>Includes six major concepts and one peripheral concept.</p>	<p>Patient self-care is accomplished with assistance that compensates for the patient's limitations when the patient cannot perform these functions independently. Nurses support and protect the patient.</p> <p><i>Example:</i> A home care client who has become paraplegic following a spinal cord injury may require that nurses assist in performing intermittent urinary catheterization and ensuring that the client has supplies at home until the patient and/or family are able to independently address this health care need.</p>
Pender's Health Promotion Model 1982	Health is "a positive dynamic state, not merely the absence of disease." Each person has unique characteristics and experiences that affect subsequent actions.	<p><i>Health promotion</i> is behavior motivated by the desire to increase well-being and actualize human health potential.</p> <p><i>Health protection</i> is behavior motivated by a desire to avoid illness.</p> <p><i>Behavior-specific cognitions and affect</i> are perceived benefits of action, barriers to action, self-efficacy, activity-related affect, interpersonal influences, and situational influences.</p> <p><i>Behavioral outcomes</i> are a commitment to a plan of action.</p>	<p>The community health care setting is the best avenue for promoting health and preventing illnesses. The focus is on activities that can improve people's well-being. Health promotion and disease prevention can more easily be carried out in the community.</p> <p><i>Example:</i> An older client who successfully recovered following an acute care hospital admission for an acute respiratory infection has scheduled an RSV vaccination at a local clinic and wears an N95 mask when in public spaces where close interpersonal contact is anticipated. The client states, "I am now more selective about my social engagements due to the risk of exposure."</p>

TABLE C1 Nursing Theories at an Individual Level

Theorist/ Year	Focus	Concepts	Nursing's Role
Bandura's Social Cognitive Theory (SCT) 1986	Not specific to nursing. Opportunities for social support become available by instilling expectations, self-efficacy, and observational learning. This will achieve behavior change.	Describes individual health behaviors as influenced by the actions of others and by environmental factors. Key components that relate to individual behavior change: 1. Self-efficacy 2. Behavioral capability 3. Expectations 4. Expectancies 5. Self-control 6. Observational learning 7. Reinforcements	Nurses and other health professionals utilize the SCT framework in a wide variety of settings and populations to guide behavioral change by creating an understanding of the influences of the social determinants of health and the individual's past experiences on current behavior. <i>Example:</i> A senior-level college student who is the first person in the family to graduate college applies for opportunities post-graduation in job roles that include a comprehensive health insurance program, relocation expenses and subsidized housing, and a support plan that includes tuition remission for graduate school.

TABLE C1 Nursing Theories at an Individual Level

Theorist/ Year	Focus	Concepts	Nursing's Role
Neuman's Systems Model 1995	A broad, holistic, and system-based method to nursing. Nursing care is based on the person's relationship to stress, response, and reconstitution factors that are progressive in nature.	<p>The client as a system is in dynamic, constant energy exchange with the environment in which there is a continuous flow of input and process and output and feedback. All elements are in interaction.</p> <ul style="list-style-type: none"> Intrapersonal stressors occur within the client system boundary and correlate with the internal environment. Interpersonal stressors occur outside the client system boundary, are proximal to the system, and impact the system. Extra-personal stressors also occur outside the client system boundaries but are at a greater distance from the system than are interpersonal stressors. An example is a social policy. 	<p>Nursing's primary concern is to define the appropriate action in situations that are stress-related or concerning possible reactions of the client or client system to stressors. Nursing interventions aim to help the system adapt or adjust and retain, restore, or maintain some degree of stability between the client system variables and environmental stressors, focusing on conserving energy.</p> <p><i>Example:</i> A nurse struggled with the demands of working in an inner-city emergency department following treating clients who were involved in a mass shooting. One of the clients that the emergency room treated that day was a young member of the nurse's suburban community who unfortunately passed away due to the injuries sustained. The nurse spoke with the nurse manager and obtained mental health services and was granted time away from work to rest and recover from the trauma. The nurse subsequently returned to work with a renewed perspective of service and commitment to the many members of the community that are effectively treated annually in the emergency department.</p>

TABLE C1 Nursing Theories at an Individual Level

C.2 Nursing Theories at the Family/Community/Population Level

[Table C2](#) in this section includes family/community/population-level theories.

Theorist/Year	Focus	Concepts	Nursing's Role
Nightingale's Environmental Theory 1860	The goal of nursing is to put the patient in the best possible condition for nature to act. Nursing is “the activities that promote health in any caregiving situation. Nursing is the act of utilizing the patient’s environment to assist him in his recovery.”	Seven environmental factors that affect health: <ol style="list-style-type: none">1. Fresh air2. Pure water3. Efficient drainage4. Bed and bedding5. Cleanliness/sanitation6. Nutrition and food7. Light/direct sunlight	Nurses can modify patients' environments according to their 10 canons (<i>nursing interventions</i>) to restore health/recovery: <ol style="list-style-type: none">1. Ventilation and warming2. Light and noise3. Cleanliness of the area4. Health of houses5. Bed and bedding6. Personal cleanliness7. Variety8. Offering hope/advice9. Food10. Observation <p><i>Example:</i> Collaboration with the community to ensure that a migrant population has access to clean and healthy housing, bedding, access to sanitation services, and culturally congruent foods will offer hope for a brighter future.</p>

TABLE C2 Nursing Theories at the Family/Community/Population Level

Theorist/Year	Focus	Concepts	Nursing's Role
Milio's Framework for Prevention 1976	Health deficits often result from an imbalance between a population's health needs and health-sustaining resources.	<ol style="list-style-type: none"> 1. <i>Health status</i> is the result of deprivation and/or excess of critical health-sustaining resources. 2. <i>Behavior patterns</i> of populations are a result of limited choices, and these habits of choice are related to <ol style="list-style-type: none"> a. actual and perceived options available; and b. beliefs and expectations developed and refined over time by socialization, education, and experience. 3. <i>Organizational behavior</i> (governmental /nongovernmental) dictates the range of options available to individuals 4. <i>Individual choices</i> concerning health-promoting or health-damaging selections are affected by their effort to maximize valued resources. 5. <i>Social change</i> occurs as a result of changes in patterns in the choice-making of significant numbers of people within a population. 	<p>Nurses must examine the determinants of a community's health and attempt to influence those determinants through public policy.</p> <p>Use an upstream approach toward preventing diseases and conditions rather than waiting until illness occurs and then treating it.</p> <p><i>Example:</i> Ensuring access to vaccinations and sanitary facilities to wash hands and making sure people use masks correctly to prevent the spread of airborne viruses and bacteria will improve the health of communities.</p>

TABLE C2 Nursing Theories at the Family/Community/Population Level

Theorist/Year	Focus	Concepts	Nursing's Role
		<p>6. <i>Health education</i> can have little impact on personal choice-making of groups of people without the availability of alternative health-promoting options for investing personal resources.</p>	

TABLE C2 Nursing Theories at the Family/Community/Population Level

Theorist/Year	Focus	Concepts	Nursing's Role
Roy's Adaptation Model 1976	<i>Adaptation</i> occurs when people respond positively to environmental changes, and it is the process and outcome of individuals and groups who use conscious awareness, self-reflection, and choice to create human and environmental integration.	<p>Concepts within the model are made of four components:</p> <ol style="list-style-type: none"> 1. Health 2. Person 3. Environment 4. Nursing <p><i>Ten explicit assumptions:</i></p> <ol style="list-style-type: none"> 1. The person is a bio-psycho-social being. 2. The person is in constant interaction with a changing environment. 3. To cope with a changing world, a person uses coping mechanisms, which are biological, psychological, and social in origin. 4. Health and illness are inevitable dimensions of a person's life. 5. In order to respond positively to environmental changes, a person must adapt. 6. A person's ability to adapt is a function of the stimulus they are exposed to and their adaptation level. 7. The person's adaptation level comprises a zone indicating the range of stimulation that will lead to a positive response. 	<p><i>The goal of nursing is to promote adaptation in the four adaptive modes.</i> Nurses promote adaptation for individuals and groups in the four adaptive modes, thus contributing to health, quality of life, and dying with dignity, by assessing behaviors and factors that influence adaptive abilities and by intervening to enhance environmental interactions.</p> <p><i>Example:</i> Health concerns change across the lifespan. Providing communities with knowledge regarding the options to change when health concerns change is an important aspect of awareness, self-reflection, and personal choices.</p>

TABLE C2 Nursing Theories at the Family/Community/Population Level

Theorist/Year	Focus	Concepts	Nursing's Role
		<p>8. Each person has four modes of adaptation: physiologic needs, self-concept, role function, and interdependence.</p> <p>9. Nursing values others' opinions and perspectives. Interpersonal relations are an integral part of nursing.</p> <p>10. The objective for existence is achieving dignity and integrity.</p>	
Salmon White's Construct for Public Health Nursing 1982	<p><i>Public health</i> is an organized societal effort to protect, promote, and restore people's health, and public health nursing is focused on achieving and maintaining public health.</p>	<p><i>Three practice priorities:</i></p> <ul style="list-style-type: none"> 1. Prevention of disease and poor health 2. Protection against disease and external agents 3. Promotion of health <p>Scope of prevention spans individual, family, community, and global care.</p> <p><i>Targeted interventions are in four categories:</i></p> <ul style="list-style-type: none"> 1. Human/biological 2. Environmental 3. Medical/technological/organizational 4. Social 	<p><i>Nursing Interventions</i></p> <ul style="list-style-type: none"> 1. Education is directed toward voluntary change in the attitudes and behaviors of the subjects. 2. Engineering is directed at managing risk-related variables. 3. Enforcement is directed at mandatory regulation to achieve health.

TABLE C2 Nursing Theories at the Family/Community/Population Level

Theorist/Year	Focus	Concepts	Nursing's Role
Block & Josten's Ethical Theory of Population-Focused Nursing	<p><i>Foundational values and beliefs reflected in the community health nursing process:</i></p> <ol style="list-style-type: none"> 1. Caring 2. Principles of primary health care 3. Multiple ways of knowing 4. Individual and community partnerships and empowerment 	<p><i>Population-focused nursing's three essential elements:</i></p> <ol style="list-style-type: none"> 1. Obligation to population 2. Primacy of prevention 3. Centrality of relationship-based care 	<p><i>Relationship-based care</i> is central to the provision of community-based nursing care. Public health nursing care will improve outcomes by understanding and by developing community-based relationships when providing care for a family, community, or population.</p> <p>Example: A nurse realized that health care in her home community was lacking in both primary and tertiary care. The nurse learned that there were not enough registered nurses in the region to care for the community. For many years, the nurse traveled back home to perform stroke screenings and maintained relationships with many members of the community. Several years later, this same nurse completed a doctoral degree and became the director of a bachelor's degree program. Given this experience, the nurse was asked to consult with a local university and community health partners to develop a successful Bachelor of Science Nursing program and obtained a grant to assist students with tuition and other support resources.</p>

TABLE C2 Nursing Theories at the Family/Community/Population Level

Theorist/Year	Focus	Concepts	Nursing's Role
Social Ecological Model of Health: World Health Organization 1947	Not specific to nursing; the focus is the complex interplay between individual, relationship, community, and societal factors.	Health is affected by the interaction between the individual, the group/ community, and the physical, social, and political environments.	Create engaged partnerships and identify a comprehensive list of factors that contribute to poor health among individuals. Encourage the possibility of interpersonal relationships and community resources and for society to eliminate harm from the environment. Example: The Nightingale Initiative for Global Health (NIGH) was created to engage and empower the world's 27 million nurses and student nurses to advocate for global health by efforts. NIGH seeks to reach the United Nations (UN) Sustainable Development Goals and to promote the UN Declaration on the Rights of Indigenous Peoples. NIGH encourages self-care by working together in the global community. https://www.nighvision.net/our-vision-mission--values.html

TABLE C2 Nursing Theories at the Family/Community/Population Level

Theorist/Year	Focus	Concepts	Nursing's Role
PRECEED PROCEED Model (PPM) Crosby & Noar 2011	Designed for creating, implementing, and evaluating public health programs. PRECEDE = Predisposing, Reinforcing, and Enabling Constructs in Educational Diagnosis and Evaluation PROCEED = Policy, Regulatory, and Organizational Constructs in Educational and Environmental Development	An ecological approach to health promotion. Two key aspects of intervention are planning and evaluation. The planning process is arranged by objectives and sub-objectives.	This is a medical perspective to public health even though its focus is health promotion rather than treatment of disease.
County Health Rankings Model (https://openstax.org/r/healthranking)	Explores the measures that influence the quality and quantity of life by showing how policies and programs influence health factors that affect a community's health outcomes.	The physical environment accounts for 10 percent (air and water quality, housing, and transit). Social and economic factors account for 40 percent (education, employment, income, family and social support, and community safety). Clinical care accounts for 20 percent (access to and quality of care). Health behaviors account for 30 percent (tobacco use, diet and exercise, alcohol and drug use, and sexual activity).	Not nursing-specific but helps nurses to define the factors in the county that affect health outcomes.

TABLE C2 Nursing Theories at the Family/Community/Population Level

APPENDIX D

Frequently Used and Misused Substances

The most commonly used drugs are:

- marijuana,
- cocaine,
- opiates,
- methamphetamines, and
- alcohol.

The National Institutes of Health (NIH) National Institute on Drug Abuse (NIDA) provides current information on substance use and misuse along with a [Commonly Used Drugs Chart](https://openstax.org/r/nidanih.govre) (<https://openstax.org/r/nidanih.govre>) with links to information about each drug.

NIDA also provides a PDF of commonly used substances and principles of drug addiction treatment: [Commonly Abused Drugs](https://openstax.org/r/nidanihgovsi) (<https://openstax.org/r/nidanihgovsi>).

As a population health nurse, your role in screening clients for a substance use disorder could save their life. However, it may be challenging to start the conversation. [See this link](https://openstax.org/r/cdcgovop) (<https://openstax.org/r/cdcgovop>) from the CDC on talking about drug use with your clients.

Your words will matter when discussing addiction; use person-first language. This [guide](https://openstax.org/r/nidanihgovni) (<https://openstax.org/r/nidanihgovni>) offers tips to remember in order to reduce the stigma and negative bias surrounding addiction.

APPENDIX E

Nurse-Designed Models of Care

To recognize the work, leadership, determination, and contributions of nurses who are at the forefront of innovations in population health, the American Academy of Nursing (AAN, 2023) created the [Edge Runners program](https://openstax.org/r/runnersprofiles) (<https://openstax.org/r/runnersprofiles>). The AAN annually recognizes nurse-designed models of care that reduce cost, improve care quality, promote health equity, and increase client satisfaction. [Table E1](#) lists population health programs across care areas that were invented by nurses. Please note, the table is a comprehensive listing as of June 2023.

Program Name	Nurse Innovators
10 Steps to Promote and Protect Human Milk and Breastfeeding in Vulnerable Infants	Diane L. Spatz PhD, RN-BC, FAAN
11th Street Family Health Services	Patricia Gerrity PhD, RN, FAAN
A Caring Science Model of Specialized Dementia Care for Transforming Practice and Advancing Health Equity	María de los Ángeles Ortega (formerly Ordóñez), DNP, APRN, GNP-BC, PMHNP-BC, CDP, FAANP, FAAN
Accountable Community of Health	Billie Lynn Allard, MS, RN
The Aging in Place Project	Marilyn Rantz, PhD, RN, FAAN
The American Association of Critical Care Nurses (AACN) Clinical Scene Investigator (CSI) Academy	Karen Cox, PhD, RN, FAAN; Susan R. Lacey, PhD, RN, FAAN
Angel Eye Web-Camera System	Sarah Rhoads, PhD, DNP, WHNP-BC
Arkansas Aging Initiative	Claudia J. Beverly, PhD, RN, FAAN
Canines Providing Assistance to Wounded Warriors (C-P.A.W.W.)	Cheryl Krause-Parello, PhD, RN, FAAN
Caregiver Skill Building Intervention (CSBI)	Carol J. Farran, DNSc, RN, FAAN
Center for Midwifery – CU College of Nursing	Jessica Anderson, DNP, CNM, WHNP, FACNM
Centering Healthcare Institute	Sharon Schindler Rising, CNM, MSN
The Chicago Parent Program	Deborah Gross, DNSc, RN, FAAN; Susan Breitenstein, PhD, RN, FAAN; Christine Garvey, PhD, RN; Wrenetha Julion, PhD, MPH, RN, FAAN
Collaborative Alliance for Nursing Outcomes	Nancy Donaldson, DNS, RN, FAAN; Diane Storer Brown, PhD, RN, FNAHQ, FAAN
Collaborative KMC Care Model	John N. Cranmer, DNP, MPH, MSN, BSN, ANP, CPH, EBP(CH); Lynn M. Sibley, CNM, RN, PhD, FACNM, FAAN; Abebe Gebremariam Gobezayehu, MD; Lamesgin Alamnih, BSc, MPH; Mulusew Lijalem Belew, MHS, BS, AD
Community Aging in Place: Advancing Better Living for Elders (CAPABLE)	Sarah Szanton, PhD, ANP, FAAN

TABLE E1 AAN Edge Runners Population Health Programs

Program Name	Nurse Innovators
Community-Based Smoking Cessation Program (CSCP)	Man Ping Wang, PhD, MPH, MPhil, BNurs, RN, FAAN
Community Health Education, Advocacy, and Empowerment: Promotores de la Salud	Connie Vance, EdD, RN, FAAN; Mary Healey-Sedutto, MPA, PhD
Complex Care Center	Lauran Hardin, MSN, RN-BC, CNL
Coping Skills Training	Margaret Grey, DrPH, RN, FAAN
Creating Opportunities for Parent Empowerment (COPE)	Bernadette Mazurek Melnyk, PhD, RN, CPNP/PMHNP, FAAN, FNAP
Creating Opportunities for Personal Empowerment (COPE) for Children, Teens, and College-Age Students	Bernadette Mazurek Melnyk, PhD, RN, CPNP/PMHNP, FAAN, FNAP
¡Cuídate!	Antonia M. Villaruel, PhD, FAAN; Loretta Sweet Jemmott, PhD, RN, FAAN
Danger Assessment: An Instrument to Help Abused Women Assess Their Risk of Homicide	Jacquelyn Campbell, PhD, RN, FAAN
Durham Homeless Care Transitions	Julia Gamble, MPH, NP, RN; Donna Biederman, DrPH, MN, RN, CPH, FAAN; Sally Wilson, MDiv
Fall Tailoring Interventions for Patient Safety (TIPS)	Patricia C. Dykes PhD, MA, RN, FAAN, FACMI; Ann Hurley, DNSc FAAN, FGSA; Diane Carroll, PhD, RN, FAAN, FAHA, FESC
Family Health and Birth Center in the Developing Families Center	Ruth Watson Lubic, EdD, RN, CNM, FAAN
Family Practice and Counseling Network	Donna Torrisi, MSN, CRNP
Family Presence During Invasive Procedures and Cardiopulmonary Resuscitation	Cathie Guzzetta, PhD, RN, FAAN; Angela Clark, PhD, RN, FAAN, FAHA
Families Talking Together	Vincent Guilamo-Ramos, PhD, MPH, LCSW, RN, ANP-BC, PMHNP-BC, FAAN
Farm Dinner Theatre	Deborah B. Reed, PhD, MSPH, RN, FAAOHN, FAAN
The Harambee Nursing Center	Kay T. Roberts, EdD, MSN, ARNP, FAAN
The Harriet Lane Compassionate Care Program	Cynda Hylton Rushton, PhD, RN, FAAN
Immersion Model for Diversifying Nurse Anesthesia Programs	Wallena Gould, EdD, CRNA, FAANA, FAAN
Improving the Accuracy of Linear Growth Assessment in Children	Terri Lipman, PhD, CRNP, FAAN; Karen D. Hench, MS, RN
INSIGHTS into Children's Temperament	Sandee McClowry, PhD, RN, FAAN
Integrated Health Care (IHC)	Judith Storfjell, PhD, RN, FAAN
Interprofessional Practice at the Vine School Health Center: A School-Based Nurse-Managed Clinic	Nan M. Gaylord, PhD, RN, CPNP- PC, PMHS, FAANP, FAAN

TABLE E1 AAN Edge Runners Population Health Programs

Program Name	Nurse Innovators
Kentucky Racing Health Services Center	Whitney Nash, PhD, APRN; Sara Robertson, DNP, APRN, FNP
Living Independently for Elders Center (LIFE)	Eileen M. Sullivan-Marx, PhD, RN, FAAN
Los trastornos del sueño y la promoción del sueño saludable [Sleep disorders and the promotion of healthy sleep]	Carol M. Baldwin, PhD, RN, CHTP, CT, AHN-BC, FAAN; Cipriana Caudillo Cisneros, MS, RN; Luxana Reynaga Ornelas, PhD, MSN, RN
Making Transitional Care More Effective & Efficient	Mary D. Naylor, PhD, RN, FAAN
Mantram Repetition Program: Mind-Body-Spiritual Approach to Symptom and Stress Management	Jill E. Bormann, PhD, RN, FAAN
Marquette Model of Natural Family Planning and Fertility Awareness Based Method	Richard J. Fehring, PhD, RN, FAAN; Mary Schneider, PhD, APRN, FNP-BC; Susana Crespo, BSN, RN, NFPI; MaryLee (Kiene) Barron, PhD, APRN, FNP-BC; Qiyan Mu, PhD, RN; Thomas Bouchard, MD, Family Medicine; Kathleen Raviele, MD, Ob/Gyn
Mental Health Integration at Intermountain Healthcare, UT	Brenda Reiss-Brennan, PhD, APRN
The Mount Sinai Primary Care Hepatitis C Clinical and Research Program	Donald Gardenier, DNP, FNP-BC, FAANP, FAAN; Jeffrey J. Weiss, PhD, MS
National University Nurse Managed Clinic	Gloria J. McNeal, PhD, MSN, ACNS-BC, FAAN; Arнета Finney, PhD, APRN, FNP-C, APWHC, CNL; Angela Williams, PhD, FNP-C, APRN, CNL; Patricia L. Humbles, PhD, RN (Ret.)
Nurse Managed Health Centers	Tine Hansen-Turton, FAAN; Joanne M. Pohl, PhD, ANP-BC, FAAN
Nurse-Family Partnerships Helping First-Time Parents Succeed	Harriet Kitzman, PhD, RN, FAAN
Nurses Improving Care for Healthsystems Elders (NICHE)	Mattia J. Gilmartin PhD, RN, FAAN; Jennifer L. Pettis, MSN, RN, CNE; Eugenia Bachaleda, MA; Louise Simon, BS, LLM, ICBB; Joanna Melendez, BS; Eileen Sullivan-Marx, PhD, RN, FAAN; Terry Fulmer, PhD, RN, FAAN
On Lok Senior Health Services	Jennie Chin Hansen, MS, RN, FAAN
One Year Post-Baccalaureate Nurse Residency	Colleen J. Goode, PhD, RN, FAAN, NEA-BC; Cathleen Krsek, MSN, MBA, RN, FAAN
Oral Care in Mechanically Ventilated Adults	Cindy Munro, PhD, RN, ANP-BC, FAANP, FAAN, FAAAS
Oral Health Nursing Education and Practice Program	Judith Haber, PhD, APRN, FAAN; Erin Hartnett, DNP, PNPPC-BC, CPNP
PATHways Prenatal Program and Beyond Birth Comprehensive Treatment and Recovery Program	Kristin Ashford, PhD, WHNP-BC, FAAN; John O'Brien, MD, MFM; Seth Himelhoch, MD, MPH
Perioperative Pressure Ulcer Prevention Program	Susan M. Scott, MSN, RN, WOCN
Quality Improvement Program for Missouri (QIPMO)	Marilyn J. Rantz, PhD, RN, FAAN
Quiet4Healthy Farm	Marjorie McCullagh, PhD, RN, APHN-BC, COHN-S, FAAOHN, FAAN

TABLE E1 AAN Edge Runners Population Health Programs

Program Name	Nurse Innovators
Reducing Depressive Symptoms & Enhancing Parenting in Low-Income & Newly-Immigrated Mothers of Infants & Toddlers	Linda S. Beeber, PhD, PMHCNS-BC, FAAN
RightCare Solutions	Kathryn H. Bowles, PhD, RN, FAAN, FACMI
Senior ASSIST	Diane McGee, MSN, RN
SeniorWISE	Graham J. McDougall, Jr., PhD, RN, FAAN, FGSA
Special Care Unit for the Critically Ill	Barbara Daly, PhD, RN, FAAN
Suicide Prevention in Nursing: Breaking the Silence	Judy E. Davidson, DNP, RN, MCCM, FAAN
Talking Circle Intervention	John Lowe, PhD, RN, FAAN
TelEmergency: Distance Emergency Care Using Nurse Practitioners	Kristi Henderson, MSN, FAEN
Tobacco Free Nurses	Linda Sarna, PhD, RN, FAAN; Stella Aguinaga Bialous, DrPH, RN, FAAN
Training in the Assessment of Depression	Ellen L. Brown, EdD, RN
Transforming Care at the Bedside	Susan B. Hassmiller, PhD, RN, FAAN; Patricia Rutherford, MS, RN
Transforming the Alzheimer's Experience with an App: Dementia Guide Expert	Valerie Gruss, PD, APRN, GNP-BC, FAAN
Transforming Post-Hospitalization, Newborn Circumcision Care Through a Nurse Practitioner-Led Care Delivery Model	Vivian W. Williams, MSN, RN, CPN
UCLA Alzheimer's and Dementia Care (ADC) Program	Leslie Chang Evertson, GNP-BC; Mihae Kim, AGPCNP-BC; Michelle Panlilio, GNP-BC; Kelsey Stander, AGNP-BC
Wise Health Decisions	Nancy E. Dayhoff, EdD, RN, CNS; Patricia S. Moore, MSN, RN, CNS, CDE

TABLE E1 AAN Edge Runners Population Health Programs

ANSWER KEY

Chapter 1

Review Questions

1. b. Population health aims to improve health outcomes for groups of people, with a special focus on public policy and environmental, social, and behavioral factors that impact health for all.
2. c. Individual-level interventions work to improve the health of one client at a time.
3. a. A central tenet of population health is emphasizing preventive efforts and proactively facilitating health instead of reacting to diseases as they come.
4. b. A midstream approach to improving health outcomes involves activities that happen in a specific organization, such as a lunchtime walking program.
5. b. Health education workshops can reach a large group of clients in a community and provide them with knowledge and skills to support their own health, prevent disease, and even promote health among their families and friends.
6. d. General mortality is the number of deaths across a large population. Reports of general mortality include information about the leading causes of death across the population and estimates of years of potential life lost when people die prematurely.
7. b. Siloed health care is also the practice of treating one condition or disease at a time without consideration of other diagnoses or the client's living environment, education, social situation, and family, among other characteristics.
8. a. Population-based practices in nursing focus on improving the health of populations through proactive, not reactive, approaches to health and wellness.
9. d. Transitional care involves coordination of clients as they move between different care settings of the health care continuum. It should facilitate a smooth transition for the client and minimize the risk for errors.
10. b. Ambulatory care provides health services on an outpatient basis in clinics and health centers. Ambulatory care can meet health needs through targeted clinics or specialized health services, such as for a chronic condition.

Chapter 2

Review Questions

1. b. Notifiable infectious diseases, such as hepatitis A, require health care providers to report the disease to public health officials. Reporting is mandated by law at state and local levels, whereas reporting to the CDC is voluntary.
2. c. Upstream interventions target the root causes or sources of health issues instead of focusing on symptom management or consequences of disease. Obtaining funding for a walking trail addresses a deficit in the community that may contribute to sedentary lifestyles.
3. d. Public health focuses on improving the health of the entire public and supports population health, which focuses on the health of a group of people. The public health nurse recommends and organizes efforts in public policy, governance, and health services to protect and advance the health of the population.
4. b. Reform movements concerning child labor, working conditions, and overcrowding of cities led to policies and regulations aiming to protect the health of the public. This period in U.S. history, and the efforts of workers to reform practices, are credited with establishing the modern public health system.
5. c. Illness surveillance and monitoring is one example of public health supporting population health. Public health departments collect data on the health of the population through various channels. They may use formal surveillance systems, such as requesting hospital or county reports, or they may conduct targeted surveys. Data is collected and analyzed to obtain a complete picture on rates of disease, injury, contamination, contagiousness, health impact, and other variables or indicators.
6. b. The three core functions of public health include assessment, policy development, and assurance. When

engaged in the core function of assessment, the public health nurse monitors a community's health trends, health disparities and injustices, and health problems requiring intervention and resource support.

- 7.** d. The three core functions of public health include assessment, policy development, and assurance. The assurance function aims to promote justice and equity in health care and actively works to make health attainable for all.
- 8.** d. Quaternary prevention refers to actions taken to protect individuals from health interventions that may be unnecessary or potentially harmful. Clients should not be subjected to tests that will ultimately not change the treatment plan. Similarly, clients should not undergo treatments or procedures that may do more harm than good.
- 9.** c. The goal of tertiary prevention strategies is to reduce the negative impact of a health condition and prevent complications.
- 10.** d. Primary prevention activities focus on preventing adverse health outcomes by targeting populations or groups at high risk of a disease, disorder, or condition. Providing education to adolescents on reducing the risk of sexually transmitted infections can address lifestyle factors and promote healthy behaviors.

Chapter 3

Review Questions

- 1.** b. Community health refers to a community's physical, mental, and social well-being and involves health promotion, risk reduction, and disease prevention efforts to support health. Promoting a weekly farmer's market of locally grown produce provides the opportunity for the community to engage in healthy eating practices to reduce the risk for heart disease.
- 2.** b. Following WWII, nurses sought professional roles with greater autonomy and found that public/community health nursing met this need. In this public/community health role, nurses provided education to raise public awareness of health issues, including the promotion of vaccinations to increase the proportion of the population receiving a vaccination.
- 3.** c. Scope of practice refers to the professional activities involved in the role of registered nurse. Defining a scope of practice helps nurses work within and to their level of qualification, expertise, and competence. Standards of practice are the principles and guidelines professionals must adhere to in their role.
- 4.** b. The ANA has identified nine core concepts of practice based on the dynamic and complex work of public health nursing: social determinants of health, community collaboration, population health, ecological model of health, culturally congruent practice, levels of prevention, ethics, social justice, and health equity.
- 5.** c. The public health sciences domain of the Quad Council Coalition's Community/Public Health Nursing Competencies focuses on understanding the foundation and prominent events of public health, applying public sciences to practice, critiquing and developing research, using evidence when developing policies and programs, and establishing academic partnerships.
- 6.** b. The Quad Council Coalition's Community/Public Health Nursing Competencies were developed to guide the professional development of community health nurses. Cultural competency skills include understanding and responding to diverse needs, assessing organizational cultural diversity and competence, assessing effects of policies and programs on different populations, and taking action to support a diverse public health workforce.
- 7.** b. Downstream interventions include responses to health issues without focusing on solving or preventing health problems, such as assisting clients in the management of their diagnoses.
- 8.** c. Social prescribing involves referring clients and families to community resources, activities, and groups other than those traditionally thought of as being related to the health care setting. Volunteering is an example of social prescribing that can improve a client's emotional health, social connectedness, and feelings of empowerment.
- 9.** b. Promoting health via a television news interview about bike safety tips for children represents primary prevention, as viewers will receive health education to prevent accidents and injury.
- 10.** a. Secondary prevention activities are those aimed at early disease detection, such as educating the public about the signs and symptoms of influenza.

Chapter 4

Review Questions

1. c. Mortality is the number of deaths in a certain group of people during a certain period of time.
2. d. The social determinants of health (SDOH) are the conditions of the environments in which an individual is born, lives, learns, works, plays, and worships. They include economic stability, education access and quality, health care access and quality, neighborhood and built environment, and social and community context.
3. d. Vital statistics—the records of birth, death, marriages, health, and disease—are a critical national information resource for understanding public health.
4. c. Increased lifespan has largely been attributed to improvements in sanitation, water supplies, workplace safety, food and drug safety, immunization rates, nutrition, hygiene, and housing.
5. d. Health can be defined as the absence of disease or impairment, as a state of being that allows the individual to adequately cope with all the demands of daily life, or as a state of balance that an individual has established within themselves and with their social and physical environment. The client who perceives that they are in good health despite being treated for high blood pressure is displaying an internal balance in which chronic illness is not negatively affecting well-being.
6. c. The years of reasonable quality of life that the client will gain after quitting smoking are referred to as quality-adjusted life years.
7. c. The combined measure of mortality and morbidity rates is referred to as the burden of disease, an indication of the effects of disease on a population. The burden of disease is measured by disability-adjusted life years.
8. a. Heart disease has been the leading cause of death globally for more than 20 years and is the most common cause of death for both men and women overall and for most racial and ethnic groups in the United States.
9. a. United Nations member countries established sustainable development goals to create a more fair, just, and equitable world. Goals related to the planet address climate change and managing natural resources.
10. a. Life expectancy in the United States has increased over the past 100 years, and the rate of death has decreased.

Chapter 5

Unfolding Case Study

1. a. Underrepresented populations, such as ethnic minorities, tend to be impacted the most by chronic health conditions such as hypertension and heart disease.
2. c. Jose's unstable financial situation makes it likely he will experience a health disparity or a preventable difference in disease experienced by members of a vulnerable population.
3. b. The nurse should be open with the client when communicating to establish trust.
4. d. Frequently clients do not take medications as prescribed due to costs. In this situation, with a client who has lost his job and has limited financial resources, the most effective strategy to encourage him to take the medication to make sure he can afford it.

Review Questions

1. b. As baby boomers born from 1946 to 1964 continue to age, the United States will have an increased need for health care services in nursing homes, long-term care, and home health care facilities.
2. a. The working poor are individuals who make too much to qualify for public health insurance programs such as Medicaid but do not make enough money to afford health insurance premiums. These clients tend to have poor health outcomes because they often wait to seek care until their disease processes are more advanced.
3. a. Health disparities overwhelmingly affect ethnic minorities and are defined as “preventable differences in the burden of disease, injury, violence, or opportunities to achieve optimal health that are experienced by socially disadvantaged populations” (CDC, 2020, para. 1).
4. c. Telehealth allows for improved communication and ease of communication between the client and provider, especially for the client who lives far from the provider.
5. c. Many nurses reported that, because the stress of working through the COVID-19 epidemic adversely affected their emotional health and well-being, they chose to leave their jobs.

6. a. Asian/Pacific Islanders experience the highest rate of hepatitis B when compared with other ethnic groups.
7. b. Vulnerable populations, including transgender individuals, often face discrimination and stigma by health care providers and, therefore, may have a lack of trust in the health care system.
8. b. To increase trust with clients from underrepresented populations, the nurse should be attuned to the client's access to resources, such as transportation, and work to address any barriers.
9. b. The ACA lowered Medicaid eligibility requirements, increasing opportunities for those who need it.
10. b. Telehealth allows for increased access to health care services, especially for those living in rural areas. Home monitoring is often paired with telehealth to allow for the long-term and continuous monitoring of chronic diseases, such as hypertension. When upward trends in blood pressure are observed, the health care team can more readily address the issue.

Chapter 6

Review Questions

1. a. Racism refers to the unfair treatment of individuals based on race. Race is a social construct, a way of categorizing or dividing individuals based on physical traits, social factors, and cultural backgrounds; it is not biologically based. Structural racism, also called institutional racism, is a process resulting in a gap in access to societal opportunities based on race, including differential access to quality education, housing, employment, medical care, and limited power and voice.
2. b. Microaggressions are common, everyday slights, snubs, or insults directed toward minorities that may be intentional or not, but they communicate derogatory or negative messages to individuals based upon their minority group status, such as complimenting an Asian client on their English.
3. a. Racial profiling refers to assuming or suspecting a person of criminal behavior based on race alone.
4. b. While many safety-net programs were developed for underrepresented and vulnerable populations such as older adults, children, individuals with limited income, or individuals with disabilities, some government policies have been written in a way that locks out many individuals who would otherwise qualify. For example, some states have attempted to impose eligibility restrictions on Medicaid expansion, including work-reporting requirements rooted in racist assumptions about the work ethic of Black individuals.
5. b. Allostatic load is the body's physiologic "wear and tear" due to an individual's exposure to stressors that accumulate throughout the lifespan. Allostatic load has been studied extensively in the setting of structural discrimination and racism and can be measured from biomarkers such as blood pressure, albumin, hormone levels, cholesterol levels, and C-reactive protein levels among others. High allostatic load is associated with increased adverse cardiac outcomes and chronic diseases, such as hypertension.
6. b. Red lines were often drawn around communities with large Black populations, effectively labeling them as hazardous investment areas. The term *redlining* came to mean a system of denying borrowers access to mortgage loans based on the location of properties in disadvantaged neighborhoods that were often comprised of minority populations. Such changes paved the way for industry to move in with coal-fired power plants, bus garages, and hazardous waste disposal plants, mostly in low-income BIPOC communities. Most redlined neighborhoods were in urban areas where widespread community disinvestment resulted in less green space and tree canopies and increased urban heat exposure.
7. d. Historically, BIPOC communities distrust health care systems due to the egregious harms they have experienced throughout history.
8. b. Implicit bias refers to an unconscious bias, or negative attitude against a specific individual or group based on race. It often manifests as nurses administering less pain medication to their BIPOC clients in comparison to their White clients. The nurse is treating the pain and not ignoring it but is letting the unconscious bias that Black individuals experience less pain than White individuals interfere with appropriate and equitable care.
9. a. Food deserts are often located in lower-income neighborhoods due to factors such as redlining and the marginalization of BIPOC and low-income communities. Redlining is a prime example of the structural nature of racism.
10. c. While health insurance coverage and access and income level are implicated in health care disparities, studies have demonstrated that when these items are controlled for (or considered equal), studies have continued to demonstrate BIPOC women are less likely to receive routine medical care and overall experience a lower quality of care, highlighting the prominent role of provider discrimination.

Chapter 7

Review Questions

1. d. Medicare is a government health insurance program that covers Americans 65 years of age and older, regardless of their health. It may also cover some individuals with disabilities, end-stage renal disease, and amyotrophic lateral sclerosis.
2. c. The Hospital Value-Based Purchasing Program bases Medicare payments on quality of care rather than services performed. The development of a pressure injury while in the hospital is considered a negative outcome, leading to decreased reimbursement. Therefore, hospitals are incentivized to focus on health care quality.
3. c. The use of telehealth can provide care remotely to individuals who live in care deserts where there is limited access to health care services.
4. b. Care delivery models refer to how health care providers work together to provide health care to clients. In the integrated service lines, hospitals and health care systems organize around specific disease states such as heart failure throughout the continuum of client care.
5. c. A marginalized community is one that is excluded from the dominant group's cultural, economic, educational, or social life. Marginalized communities are likely to face barriers to accessing health care, such as a lack of health insurance or a paucity of health care providers within the community.
6. c. LHIIs are a subset of high-priority Healthy People 2030 objectives aimed at improving health and well-being across the lifespan and topic areas.
7. c. Community health nurses need to recognize the impact of high drug prices on their clients who may not take their medications if they cannot afford them. Among other options, nurses should contact the prescribers to identify less costly alternatives for the client.
8. b. Mechanisms for delivering public health policy interventions include fiscal policy, regulation, education, preventative treatment, and screening. Screening involves testing to detect diseases or other issues before symptoms are apparent, such as screening for elevated lipid levels that can detect coronary artery disease before symptoms of heart disease develop.
9. c. The medical home model of care uses an integrated team approach to provide care for the whole person, including physical and social needs.
10. b. The IHI Triple Aim is a framework developed by the IHI that aims to improve health care system performance using five components. The component of Population Health Management is involved in prevention and health promotion.

Chapter 8

Review Questions

1. a. The social determinants of health are the conditions in environments where people are born, live, learn, work, play, worship, and age that affect a wide range of health, functioning, and quality-of-life outcomes and risks.
2. c. Stable employment with a living wage is the key to economic stability.
3. d. Exposure to crime and violence is an adverse childhood experience, as it is a traumatic event that undermines a child's sense of safety, security, and bonding.
4. b. A higher education is associated with higher-paying jobs and therefore a higher socioeconomic position (SEP). SEP is a main driver of better health outcomes. Individuals with higher levels of educational attainment are more likely to live longer and healthier lives.
5. a. Volunteering and giving back to the community is a prime example of building social capital. This is a form of civic participation and benefits both the individual and community.
6. a. By providing mobile health screenings for individuals who are unable to make it to the clinic, the health care team is thinking from a health equity lens, recognizes that everyone is not the same, and distributes the exact resources or opportunities (in this case, a mobile health screening unit) needed by each individual to reach an equal outcome among individuals.
7. a. Health disparities are preventable differences in health between groups of individuals, usually as a result of social or economic factors, geographic location, and environment. BIPOC clients who are pregnant

experience the highest rates of infant mortality due to a myriad of social and economic disadvantages including racism.

8. c. Clinical care impacts only 20 percent of health outcomes.
9. a. The SDOH affect the health and wellness of individuals and contribute to many risk factors for disease and premature death. There is a large inequity in the distribution of disease in this country, and the way to address these disparities is by being equitable and not just focusing on equality.
10. c. Upstream thinking refers to looking beyond lifestyle choices and instead addressing the root causes of some of the health style choices. For this scenario, having a lack of safe places to exercise is the main driver of the low levels of physical activity.

Chapter 9

Unfolding Case Study

1. d. The clients' physical environment is most likely hindering their ability to attend their appointments, resulting in inadequate prenatal care and ultimately poor outcomes.
2. b. All of these choices could potentially affect someone's ability to access health care, but having adequate insurance coverage is most likely to facilitate clients' access to health care.
3. b. Residential segregation is a form of systemic racism that keeps minority groups living in certain disadvantaged areas.
4. c. Tracking pregnancy-related complications is a more accurate measure of the effectiveness of interventions to address maternal health disparities.

Review Questions

1. d. Health determinants are nonmedical factors that influence health outcomes. Individuals can be exposed to environmental factors such as pollution that affect their health.
2. a. A health disparity is a health difference that adversely affects disadvantaged populations in comparison to a reference population based on one or more health outcomes.
3. c. Encouraging families to share healthy recipes with one another incorporates the effects of the families' sociocultural environment and their interpersonal levels of influence on their health.
4. a. Intersectionality occurs when one type of discrimination intersects with other factors of discrimination, such as gender, ethnicity, socioeconomic status, disability, age, geographic location, gender identity, and sexual orientation, among others.
5. b. Discrimination results from prejudices. Prejudice can contribute to members of disadvantaged groups experiencing poor health outcomes—in this situation, poor pain control.
6. d. Inadequate availability of culturally competent providers can limit health care access for non-English-speaking clients.
7. b. Race is a determinant of health that can lead to health disparities. For example, Black people are at a greater risk of developing certain diseases than their non-minority counterparts because they have less access to health care and experience greater levels of poverty.
8. c. Medicaid expansion, part of the Affordable Care Act, expanded the number of people eligible for Medicaid. Insured clients are more likely to report a regular source of health care. Differences in Medicaid eligibility vary among the states, which can account for differences in insurance coverage-related outcomes.
9. d. Gender norms are social and cultural principles that influence ideas on how different genders are supposed to behave in society. Among these factors, social norms related to masculinity are most likely to affect the adherence rates of men performing testicular exams.
10. a. Rural residents are more likely to engage in riskier health behavior and have poorer health outcomes than residents of urban areas.

Chapter 10

Review Questions

1. b. Genetic associations are only one component of a client's health, which includes lifestyle, environment, and social factors.

2. b. Pender's Health Promotion Model helps nurses understand the determinants of health behavior to promote health through effective behavioral counseling. The model directs nurses to assess for eight beliefs when planning for behavior change and health intervention. The belief of perceived self-efficacy is the personal capability to organize and execute a particular health behavior and self-confidence in performing the health behavior successfully, such as this client's verbalization of confidence in developing a healthy weekly meal plan for the family.
3. d. The Socio-Ecological Model considers how human growth and behavior can accommodate and change given the environment and systems that exist around people and how people interact with such environments and systems. The five systems identified in this model are the microsystem, mesosystem, exosystem, macrosystem, and chronosystem. The macrosystem includes codified laws, regulations, and rules as well as economic, social, educational, and legal systems.
4. b. The UNICEF Socio-Ecological Model uses a socio-ecological approach as a conceptual framework for many health-promoting initiatives at the individual/interpersonal, community, organizational/institutional, and policy/system enabling environments levels. The nurse is effecting change at the community level by focusing on social beliefs and norms about breastfeeding.
5. b. The Socio-Ecological Model considers how human growth and behavior can accommodate and change given the environment and systems that exist around people. Looking for causative factors for an increase in asthma diagnoses is an example of the environment that may be contributing to rising rates of asthma among grade-school children.
6. b. Family health history helps identify strong risk factors or predictors for acquiring certain conditions and disorders, such as diabetes. However, family history alone does not mean a person will develop a disease. Although genetic associations can be robust, genetics are still only one component in an overall health picture. As heritability and the presence of certain genes or attributes are measurable, scientists can calculate the impact of genetics versus lifestyle, social, and other factors on specific health risks.
7. c. Treating all clients regardless of their ability to pay is an example of how health care can be affected by decisions made at the organizational level.
8. a. The Socio-Ecological Model considers how human growth and behavior can accommodate and change given environments, systems, and how people interact with them. The five systems identified in this model are the microsystem, mesosystem, exosystem, macrosystem, and chronosystem. The exosystem includes informal and formal social structures that do not contain the individual but encompass the settings where the individual lives, such as limited healthy food choices in a neighborhood.
9. d. The Theory of Planned Behavior explains how intention, attitudes, subjective norms, perceived behavioral control, and risk perception influence behaviors. Risk perception include a person's thoughts about the benefits and hazards of acting or not acting, such as the belief that smoking is unhealthy.
10. d. The Transtheoretical Model, also called the Stages of Change, explains how individuals progress through different phases of behavior change. In the precontemplation stage, the client does not intend to take action in the next 6 months.

Chapter 11

Unfolding Case Study

1. b. The components of an effective PICOT question are population, intervention, comparison, outcome, and time.
2. c. The intervention refers to the change or treatment that will be implemented for the identified population. The intervention in this PICOT is daily exercise.
3. c. After the PICOT question has been developed, the next step is to search the literature for research evidence to support the proposed intervention of exercise to reduce anxiety in adolescents.
4. d. Though all of the above databases could be used, Medline Full Text specifically highlights articles regarding public health and public policy.
5. d. Critically appraising each study for relevance and credibility is necessary to ensure the information provided is meaningful, trustworthy, and relevant. Information is considered trustworthy based on its confirmability and the reviewer's confidence in the believability of the information produced in the literature.
6. a. Researchers use a pyramid to rank the evidence. At the highest level of the pyramid, randomized controlled

studies should be used first to compile the most effective evidence.

Review Questions

1. c. EBDM provides a concrete, objective, and replicable process to ensure that interventions are supported by data.
2. b. The applicability of a research article refers to how well the results and data can pertain to broad or specific populations.
3. a. Case reports and case studies are the lowest levels of the hierarchy of evidence or research.
4. b. Zinc supplementation is the intervention in this PICOT question. Intervention is the change or treatment that will be implemented for the identified client (population).
5. b. Synthesizing the data involves compiling the information to determine what the research is saying about the concern/issue and identifying common trends in the data.
6. a. Databases, collections of information organized in a systematic method, are helpful during the process of searching for sources of existing literature related to the topic of one's inquiry. The Cochrane Library database is a core source for EBP, including systematic reviews that are regularly updated.
7. d. Each participant in a research study should receive fully transparent information regarding the intent of the research and how the information will be used.
8. d. The population of a PICOT question is the individuals, community, or population being studied. In this research question, the nurse is studying high school students in a specific rural community who smoke.
9. a. Qualitative research deals with nonnumerical data such as experiences, attitudes, and behaviors.
10. c. During the evaluation phase, the final step in EBDM, the nurse determines the effectiveness of the implemented plan by determining if the plan accomplished what was intended and, if not, what may need to be changed moving forward.

Chapter 12

Review Questions

1. c. Epidemiology includes assessment of the distribution (including describing demographic characteristics of an affected population), determinants (including a study of possible risk factors), and application to control health problems (such as closing a restaurant).
2. a. The epidemiologic triad of disease causation refers to agent-host-environment.
3. a. Direct transmission occurs when an infectious agent is transmitted by direct contact or droplet spread. Droplet spread is considered direct transmission as the particles travel only a short distance and do not remain suspended in the air for long periods of time or distance.
4. a. Endemic refers to the continual and constant presence of a disease within a given geographic area. It may also be referred to as the usual rate of disease at any given time.
5. c. A study that assesses exposure and documents subsequent occurrence of disease in a group who all have the same disease is an observational cohort study.
6. a. The hallmark feature of an analytic epidemiologic study is use of an appropriate comparison group.
7. a. A study in which subjects are randomized into two intervention groups and monitored to identify health outcomes is a clinical trial, which is a type of experimental study.
8. b. Nightingale, the founder of professional nursing, engaged in epidemiological work by using statistics to identify a connection between poor sanitation and negative health outcomes. Nightingale gathered data to demonstrate that her sanitation reforms reduced deaths in military hospitals in Crimea.
9. b. In the subclinical stage, individuals have no overt symptoms. In infectious diseases, this stage includes an incubation period during which the pathogen multiplies to produce clinical symptoms. In noninfectious disease, it includes a latency period.
10. c. The prevalence rate is the proportion of a population with a health condition, such as pneumonia, at a certain point in time or time interval, such as the winter months.

Chapter 13

Review Questions

1. a. Public health surveillance is a method that a community has available to monitor the health among its population by detecting problems, communicating alerts as needed, guiding the appropriate response, and evaluating the effect of the response.
2. a. The epidemiological triad includes the host, agent, and environment. The greater the pathogenicity, the greater the ability of the agent to cause disease in a susceptible host. Pathogenicity is dependent upon the infectivity of the agent—its ability to invade the host, destroy host body cells, and produce toxins resulting in virulence, or severity of the infectious disease.
3. a. Measles is a highly contagious disease that is transmitted via airborne particles.
4. b. The epidemiological triad features the host, agent, and environment and describes the *who*, *what*, and *where* of the infectious process, while the chain of infection builds on this triad, including a portal of exit from the host, an environmental reservoir, transmission, and a portal of entry into a susceptible host. Pathogenicity refers to the potential ability of an agent to cause disease in a host.
5. a. Mantoux TST testing is the preferred test for children under the age of 5, but prior vaccination with bacilli Calmette-Guérin (BCG) may cause false positive reactions to the Mantoux TB skin test, in which case either QFT-Plus or T-Spot blood testing is recommended.
6. d. Since hepatitis C is transmitted by direct contact with infected blood, the primary prevention strategy to reduce the risk of transmission is to avoid sharing contaminated equipment, such as syringes and needles.
7. d. The signs of mild to moderate food poisoning are fever, diarrhea, stomach pain or cramps, and nausea or vomiting. The signs of severe food poisoning include fever higher than 102°F, bloody diarrhea, diarrhea for 3 days or more, frequent vomiting, and evidence of dehydration.
8. c. The rash of erythema migrans is erythematous, annular, and homogenous at the site of the actual tick bite, expanding over several days, often to sizes greater than 5 centimeters in diameter with a central clearing that develops as the rash expands, resulting a “bull’s eye” appearance. Erythema migrans occurs in up to 80 percent of those infected with Lyme, but the classic rash is not always present.
9. a. The CDC helps to track and investigate foodborne illnesses through the following surveillance systems: PulseNet, Foodborne Diseases Active Surveillance Network (FoodNet), System for Enteric Disease Response, Investigation, and Coordination (SEDRIC), and Foodborne Disease Outbreak Surveillance System.
10. b. Contact tracing is a means of secondary prevention to identify those at risk of infection or those already infected in order to isolate and treat them as early as possible to prevent the spread of the disease and to prevent complications in the client.

Chapter 14

Review Questions

1. c. Environmental justice refers to the fair and equitable treatment and meaningful engagement of every individual, irrespective of race, color, national origin, or socioeconomic status, in the development, execution, and enforcement of environmental laws and policies. Nurses play a crucial role in promoting and advocating for environmental justice.
2. c. The EPA uses a four-step risk assessment to evaluate potential pollution and hazards, evaluate the likelihood of exposure-related health threats, and develop standards. The third step of the risk assessment, Exposure Assessment, quantifies the extent, frequency, and length of human contact with an environmental agent or predicts the potential impact of future contact.
3. d. Nightingale’s Environmental Theory viewed nursing as the process of using the client’s environment to assist them in their recovery.
4. c. The goals of environmental justice are to offer equal protection from hazards and to ensure equal involvement of communities in making decisions about policies and regulations that impact them. Removing lead-based paint from public housing is an example of providing equal protection regardless of socioeconomic status.
5. b. Biomonitoring assesses the presence and concentration of specific substances, such as chemicals and pollutants, in living organisms through samples of blood, urine, saliva, hair, and nails.

6. c. Mold, a biological in-home health hazard, can produce burning eyes, skin rash, stuffy nose, and sore throat as well as coughing and wheezing.
7. a. The text emphasizes that pollution prevention strategies should be implemented to reduce exposure levels to environmental contaminants.
8. b. Efforts to address the impact of climate change can be divided into two categories: mitigation and adaptation. Mitigation, or the reduction of greenhouse gas emissions and pollutants to slow the rate of change, aims to prevent the planet from warming beyond critical thresholds. Improving and increasing the use of public transportation is an example of mitigation to reduce gas emissions.
9. a. Public health nurses perform the core functions of assessment, policy development, and assurance to serve as a framework for addressing environmental health issues and promoting healthier communities. While performing the core function of assurance, the nurse monitors and evaluates the implementation and effectiveness of environmental policies and programs and ensures that actions are taken when hazards are identified, such as educating the public about the need to boil contaminated drinking water.
10. b. The goal of tertiary prevention is to reduce the severity of the impact of an environmental health risk, such as developing an emergency response plan to manage environmental hazards.

Chapter 15

Unfolding Case Study

1. a. Deanna is predisposed to developing hypertension due to her family history; therefore, she is in the susceptible stage. Given that Deanna has only had one elevated blood pressure reading, it is not yet clear if she is in the clinical stage. Deanna is not in the recovery stage, as she has not yet been diagnosed with a disease.
2. c. If Deanna is diagnosed with hypertension and prescribed medication, the medication is given to control or prevent worsening of the hypertension as well as to prevent complications or other diseases as a result of hypertension, which involves tertiary prevention.
3. c. The manager is demonstrating their perception that health promotion and disease prevention are not as important as timeliness.
4. c. The nurse is encouraging secondary prevention by giving the client the tools needed to lower her blood pressure before it causes negative health outcomes.

Review Questions

1. a. The role of the nurse as advocate involves helping to create environments that support better health. In this scenario, the nurse is advocating not only for their two specific clients, but also the community of the apartment as a whole.
2. c. The subclinical stage of disease stays below the surface of clinical detection and has no recognizable clinical findings. The client has no symptoms because they are in the subclinical stage of disease.
3. d. The client's vertigo is an internal condition directly related to the skills needed in that exercise class and is leading them to reject particular interventions. Therefore, it is an issue-related skill that is negatively influencing their behavior.
4. b. Cues to action are events, people, or things that trigger people to change behavior. Because the individual has been mindful of their weight loss, this cue is likely to influence their food choices.
5. d. The principal is considering the key attributes affecting an innovation's adoption, including compatibility and complexity.
6. a. Primordial prevention involves social and environmental activities that reduce risk factors in a community.
7. b. To develop a community-wide health promotion program, the community health nurse needs to view health promotion as an obligation of multiple sectors, not just the responsibility of the health sector, in order to encourage the health of all citizens.
8. a. The public health nurse recognizes the limited access to health care services in the rural community and takes action to address this issue by establishing a mobile clinic. By establishing a regular visitation schedule, the nurse aims to improve the availability of health care services, ensuring that community members have access to timely medical care.
9. d. A lack of financial resources is a common barrier that arises from the health care system itself. The other

three options are not system-related barriers.

- 10.** d. The app likely does not fit with the intended audience, leading to a lack of widespread acceptance, which would indicate an issue with compatibility.

Chapter 16

Review Questions

- 1.** b. When the community is the client, the nurse addresses the health needs of a community or population instead of one or more individual clients. Conducting health screenings for individuals in a specific town or city would help the nurse assess the health needs in the community.
- 2.** a. Healthy People 2030 identifies voting, volunteering, participating in group activities and activities like community gardening, and participating in a recreational sports team as methods of civic participation. Such activities can benefit the health of individuals and populations.
- 3.** c. Nurses should involve community members in community assessments to increase the likelihood that the community will embrace the change and participate in health programs.
- 4.** d. The self-perception–self-concept pattern focuses on how community members perceive themselves and the role of the community.
- 5.** b. During the diagnosis stage of the nursing process, the nurse analyzes the data collected to identify areas of opportunity in the community in the context of health. The nurse will identify patterns, trends, or key problems in the data that point to a need for intervention in order to improve health.
- 6.** b. The RWJF Culture of Health initiative was developed to promote a shared understanding that good health is a fundamental right and essential to well-being and prosperity across the United States. Cross-sector collaboration involves organizations outside of those traditionally or directly associated with health care, such as schools and law enforcement, working together to support better health across communities.
- 7.** d. Making health a shared value requires society as a whole to commit to developing power structures and social systems that allow access to health for all. The mindset and expectations, sense of community, and civic engagement of a community are all drivers of change toward making health a shared value.
- 8.** a. The first stage of the nursing process is assessment. Data collected in this stage informs community health interventions. Without actual data from the community, the nurse would not be able to identify patterns, trends, or problems that indicate health risk or a need for support.
- 9.** c. Holism is the concept that all parts of a whole are interconnected and do not exist or function without each other. When applied to community-based nursing, holism means that the nurse must consider that the whole community comprises multiple dimensions of health.
- 10.** b. When applied to community health, Gordon’s health perception–health management pattern assesses the health and safety of a community, including its disaster plans and public safety.

Chapter 17

Unfolding Case Study

- 1.** d. Focus groups gather qualitative data from participants who have experience with the topic. Participants provide their perspectives of the issue in a discussion-based setting. It would be appropriate to gather this information from local emergency responders because they have firsthand experience responding to drug overdoses. Additionally, these data are not consistently reported by methods that the team could easily access in another way.
- 2.** a. A drug rehabilitation center is located in the community. Enabling factors are characteristics of the environment and community that make it easier for community members to change their behavior or their environment. This includes community programs, services, and resources. Media is a reinforcing factor to motivate specific behaviors. Knowledge, beliefs, values, and attitudes of the individual are predisposing factors. Attaining knowledge in high school and values learned from family are predisposing factors.
- 3.** a. The nursing diagnosis includes all parts. The other responses do not contain all parts and/or do not align with community perceptions and needs.
- 4.** b. Availability of appointments at the local drug rehabilitation center could be a barrier to program implementation. Promoting drug rehabilitation would be ineffective if appointments were not available.

Review Questions

- 1.** b. A client with interactive health literacy has skills that have advanced beyond the functional, or basic, health literacy level. This client is able to use a variety of sources to answer health questions and apply that information to real-life scenarios.
- 2.** a. Benchmarking involves comparing local information to other measures or standards. Healthy People 2030 provides national objectives to improve health and well-being over the next decade.
- 3.** d. Community nursing diagnoses must include “risk of” to describe the health need or problem, “among” to describe the aggregate or population that is affected, and “related to” to describe community characteristics or factors that influence the health need.
- 4.** c. Community systems are services and resources that are available to community members. The number and location of health care providers falls under community systems and is used to determine access to health care providers.
- 5.** b. After data is collected and reviewed, the team analyzes the data in order to prioritize community health problems. The team plans implementation strategies after the top health priorities are chosen. Results are shared with the community after the data is analyzed. Evaluation occurs after the CHIP has been implemented.
- 6.** a. A client with functional health literacy has basic health literacy skills and is able to obtain relevant information and apply it to prescribed activity, such as reading a prescription label and taking the medication accordingly.
- 7.** c. The psychomotor domain is the performance of skills that require neuromuscular coordination. An example is self-administration of insulin.
- 8.** b. In constructivist learning theory, learners actively use experiences and reflection to build upon preexisting knowledge rather than passively taking in information.
- 9.** d. Auditory learners process information and learn best through listening; appropriate educational methods are verbal lecture, discussion, music, podcasts, and reading aloud.
- 10.** a. During the Continuously Improve the Community phase of MAPP, power analyses and partner profiles are completed.

Chapter 18

Review Questions

- 1.** b. The client in the preparation stage is planning for behavior change in the next 30 days. Setting realistic goals is appropriate at this stage.
- 2.** a. The nurse selects activities in Step 3 of the Intervention Mapping framework. Step 4, develop program materials, includes writing program communication, messaging, and resources.
- 3.** c. Proportionality states the program or action is equitable and fair. It also refers to decreasing inequities that already exist so that health outcomes are more proportional.
- 4.** c. A conference room is an example of a physical resource.
- 5.** b. SMART goals are specific, measurable, attainable, realistic, and time-bound. The program objective of “Reported alcohol use by county youth will decrease from five percent to four percent by December 31, 2025” meets all of these requirements.
- 6.** b. Step 3, develop partnership agreements, includes determining the roles and responsibilities of all partners and creating a contract or agreement specifying each.
- 7.** d. Process objectives direct activities to be completed in a specific time frame and describes participants, interactions, and activities.
- 8.** a. The Institutional Review Board (IRB) ensures that participants in a research study have the choice to participate or withdraw from a study at any time and that they must give informed consent to participate.
- 9.** d. Determinants of health are factors that affect the health of individuals and communities. Social determinants of health include economic stability, education access and quality, health care access and quality, neighborhood and built environment, and social and community context.
- 10.** a. An individual is ready for a change in health behavior when they believe they are susceptible to the health problem, they believe the health problem has serious consequences, they believe taking action will reduce the risk of the health problem, they believe the benefits of change outweigh the costs, they are exposed to

factors that prompt change, and they are confident in their ability to make a change.

Chapter 19

Review Questions

- 1.** b. Learning material should be presented in an organized manner from simple to complex.
- 2.** d. A needs assessment is an important first step in planning a community health program. This assessment will identify strengths, resources, and current needs of the community.
- 3.** a. Adult learning theory builds upon what is already known about a topic and applies new knowledge to past and current experiences.
- 4.** c. A lack of trust among team members can be a barrier to team communication. A lack of trust impedes communication and planning because team members feel like they cannot have an open dialogue.
- 5.** c. The six steps for planning health education interventions include identify learning needs, establish goals and objectives, select appropriate education methods, design and implement the educational program, evaluate the educational process and effects of the program, and determine if revisions to the plan are needed. During the evaluation step, the nurse determines the extent to which learners have met the program objectives of identifying and reducing cardiac risk factors.
- 6.** d. TeamSTEPPS® is an evidence-based program that aims to eliminate preventable medication errors related to unproductive team communication, thus improving client safety. The five key principles in this program are team structure, communication, leadership, situation monitoring, and mutual support. The team structure consists of multiple backgrounds and disciplines.
- 7.** a. Maslow's hierarchy of needs begins with basic human needs and moves up to higher levels of achievement: physiological, security, social, esteem, and self-actualization. Providing a safe space for teenagers after school addresses the need for security.
- 8.** c. Behaviorism considers behavior as learned from the environment and focuses on observable behavior; it often develops a contract for behavior change.
- 9.** d. One principle of planning a community health education program is to include members of the target audience as part of the planning.
- 10.** d. Nurses should consider how developmental level may affect how the population receives information. Peer influence is stronger as adolescents' autonomy increases, so nurses may incorporate peer activities into the learning process for this population.

Chapter 20

Review Questions

- 1.** b. The nurse will see increased participation if activities are scheduled during regular school hours. Youth often have conflicts related to athletics, academics, work, or provision of sibling care after school hours.
- 2.** b. A process evaluation focuses on the implementation process to determine if the program has been implemented as planned and in the most efficient way.
- 3.** d. The nurse will prepare tools to gather data from multiple sources after the evaluation design is chosen.
- 4.** d. The nurse should use images and language that represent the target population to promote an inclusive environment.
- 5.** c. Earned income is an internal funding stream the organization uses to support programs. Earned income includes funds earned through fee for service, consultation, reimbursement, and product sales.
- 6.** c. Including members of the target population in program planning, recruitment, implementation, and evaluation is the best method to ensure sociocultural and linguistic needs are met.
- 7.** d. Community lack of interest in the program may indicate that the program no longer meets community needs.
- 8.** c. Impact evaluation measures the degree that the community health program achieves its primary goal. Most often, community health assessment data is used to evaluate the impact of existing community health programs. Pre-program CHA data and CHA data collected after the program was implemented are used to determine long-term impact.
- 9.** a. Sustainability is defined as the continuation of community health programs by decreasing dependence on

one source of funding and shifting to a new funding stream because the program is valued, cost and resource efficient, effective, and supported by the community.

- 10.** b. Billboards reach a broad audience quickly and are used to increase community awareness of health issues and events.

Chapter 21

Review Questions

- 1.** b. Cultural dietary practices are complex and multifaceted. Therefore, the nurse should approach cultural dietary practices with respect and cultural sensitivity and ask the client about their unique dietary needs and preferences. The nurse should not make assumptions.
- 2.** c. Features of holistic medicine include a balance between physical, psychological, and spiritual health and between nature and humanity to produce wholeness.
- 3.** a. Culture consists of visible and invisible elements. Invisible elements are the intangible parts of a culture, such as communication styles, rules, etiquette, views of time and space, and handling of emotions.
- 4.** c. Nonverbal communication conveys messages without words. Cultures use different nonverbal cues to convey meaning or express emotion. The nurse should pay attention to the client's use of nonverbal cues and not force nonverbal communication on the client.
- 5.** a. The microsystem consists of the immediate environment in which an individual interacts, including family, friends, and other close relationships. Cultural factors at this level may include family traditions and beliefs, cultural values, and customs related to health and wellness.
- 6.** b. Present-oriented people focus on the moment and respond to immediate needs. They live in the here and now, with future consequences playing a less significant role.
- 7.** a. Values and beliefs are non-visible aspects of culture that shape a client's perspective. The nurse should acknowledge this and listen to the client's concerns.
- 8.** b. Nurses should be prepared to ask clients questions that encourage them to share their health beliefs and cultural practices. Asking if the client has used any medications, herbs, or home treatments recognizes that there are other remedies, outside of traditional medical treatments, that clients may use when sick.
- 9.** b. Locus of control refers to an individual's beliefs about the extent of their control over the environment and what happens to them. An individual with an external locus of control believes that external forces, such as luck or fate, determine outcomes.
- 10.** b. Collectivist cultures encourage interdependence and promote the interests of the collective over the individual. Interdependence and fitting in to maintain harmony are preferred.

Chapter 22

Review Questions

- 1.** b. Understanding transcultural models and frameworks can help the nurse in this situation by guiding them to respect the client's cultural beliefs and find an alternative medication that aligns with the client's cultural values. This approach promotes culturally sensitive care and supports the client's autonomy and decision making in their health care journey.
- 2.** b. Leininger's Culture Care Diversity and Universality Theory is an example of a transcultural nursing model. This model emphasizes the importance of cultural competence in nursing, recognizing that culture influences an individual's health beliefs, practices, and outcomes. It guides nurses in providing care that respects and integrates the cultural values, traditions, and preferences of clients.
- 3.** c. Collaborating with the client and health care team to assess the safety and potential interactions between herbal remedies and prescribed medications is the most appropriate approach for ensuring the older adult client's safety while respecting their cultural beliefs. This approach aligns with the principles of person-centered care and cultural sensitivity, allowing for the integration of evidence-based care with the client's cultural practices.
- 4.** c. In this scenario, the key component of culturally responsive care is collaborating with the client to identify traditional healing practices that are safe and effective to use alongside medications. As a nurse, it is essential to acknowledge, respect, and understand the client's cultural beliefs and values and work together

with him to find a treatment plan that aligns with his culture and promotes his well-being. This approach demonstrates cultural competence and supports client-centered care.

5. d. In this scenario, the culturally responsive intervention is to discuss the client's concerns and work collaboratively with her to find a solution that respects her cultural preferences. This approach acknowledges and respects the client's cultural background, promotes client-centered care, and ensures her comfort and satisfaction with the prenatal care she receives.
6. b. In this scenario, the aim of conducting a cultural assessment for the client is to promote cultural sensitivity and understanding in the health care setting. By assessing the client's cultural background and beliefs, health care providers can provide client-centered care that respects her values, preferences, and unique needs, leading to improved communication, trust, and outcomes.
7. c. The nurse can create a safe and open environment by actively encouraging the client to ask questions, actively listening, validating their concerns, and promoting shared decision making.
8. c. This approach allows the client to feel more comfortable and trusting with their health care provider, resulting in improved client satisfaction and outcomes.
9. a. The nurse should consider the component of biological variation when providing care for the client according to the Giger and Davidhizar model. This component acknowledges that individuals from different cultural backgrounds may have unique biological variations and genetic traits that can influence their health status and response to health care treatments and interventions.
10. c. The component of cultural skill emphasizes the need for health care providers to possess the necessary knowledge and abilities to effectively understand and communicate with individuals from diverse backgrounds, such as the client with a visual impairment. The nurse should have the cultural skill to provide medication information in accessible formats, such as braille or audio recordings, to ensure effective communication and culturally congruent care.

Chapter 23

Review Questions

1. a. Communities that are “food deserts” lack grocery stores and available transportation. Moreover, residents may not have the financial resources to afford healthy food and may rely on fast food and convenience stores. These conditions place residents at risk for obesity, diabetes, and heart disease.
2. a. Nurses provide culturally congruent care when they use evidence-based nursing practice that recognizes and is consistent with the values, beliefs, worldviews, and practices of their clients. Culturally congruent care involves recognizing the client's beliefs; providing care that takes into account a client's use of a traditional healer; and creating individualized care plans that are consistent with the client's values, beliefs, worldviews, and practices.
3. a. This nurse has engaged in a stereotyping behavior, ascribing certain characteristics or behaviors, such as following a kosher diet, to a person based on their membership in a particular group.
4. b. An organizational barrier is one that exists within an organization. It includes the provision of linguistically competent services, such as medical interpreters. Structural inequities are systemic barriers and disparities in a health care system that block individuals or groups from receiving high-quality care, such as an insufficient number of primary care providers and the inability of individuals to afford health care or obtain health care insurance.
5. c. Cultural awareness occurs when nurses reflect on their own cultural backgrounds, beliefs, and biases.
6. d. The nurse demonstrates valuing of diversity by volunteering at a clinic that provides free care to immigrants. This practice allows the nurse to learn about the culture of the immigrant group and to establish relationships within the community. Discussing diversity with individuals from the same cultural background, comparing other cultures to one's own culture, and treating everyone from the same culture in a like manner do not demonstrate that the nurse values diversity.
7. c. Observing how the client uses eye contact demonstrates the nurse's awareness that clients may have different, culture-related perceptions of eye contact. Some clients consider it rude to make eye contact with a health care professional, whereas others consider eye contact a sign of attention or respect. Following this observation, the nurse may use another method to ensure the client understands the preoperative instruction, such as the teach-back method.

8. c. The nurse should pay attention to and use the terms the client uses to describe illness or body parts, rather than using medical terminology. Speaking in a louder voice than normal will not help a client understand what the nurse is saying, and the client may construe this behavior as condescending. The nurse should reinforce verbal instruction with the use of pictures, models, or demonstrations.
9. a. Best practice is to use a trained medical translator who not only knows the client's language but also understands cultural sensitivity.
10. c. The nurse should ask members of the community to review the written materials to ensure appropriateness and to enhance community buy-in. Because various colors can convey different meanings in diverse cultural groups, the nurse should determine the cultural significance of the chosen colors. All community members may not understand medical terminology; therefore, the nurse should use terminology the target group will understand, and the material should be written at a reading level appropriate for most group members. A high school reading level may be too difficult for many clients.

Chapter 24

Review Questions

1. c. To assess health literacy in culturally diverse clients, the nurse should perform a health literacy assessment using a validated tool before developing a teaching plan.
2. a. This self-assessment checklist is designed to enhance one's awareness and sensitivity of cultural and linguistic diversity and to provide concrete examples of practices that foster an environment of cultural and linguistic competence, allowing the nurse to reflect and engage in self-improvement.
3. a. Leadership commitment refers to the active involvement and support of organizational leadership in promoting cultural competence. This includes developing and implementing policies and practices that prioritize cultural competence and diversity, such as developing policies for the use of trained interpreters.
4. c. Creating a welcoming environment is part of the Promoting Cultural and Linguistic Competency Self-Assessment Checklist. The nurse can help create a welcoming environment by displaying posters, brochures, and other materials that represent the diversity of the client population.
5. b. The ACCESS model consists of six key components: assessment, communication, cultural negotiation and compromise, establishing respect and rapport, sensitivity, and safety. In this model, the nurse tailors the plan of care so it is respectful of the client's beliefs and values. This is accomplished by developing the plan of care with the client.
6. b. Developing partnerships to support organizational cultural and linguistic competence is a dynamic and multifaceted process that involves collaborating with key community partners to determine their needs, goals, and resources.
7. c. When evaluating the effectiveness of a cultural competence training program, a nurse is likely to measure for an improvement in client satisfaction scores because that is an indication if clients feel heard, understood, and respected.
8. a. To show its strong commitment to cultural competence, the organization should have a mission statement that reflects its commitment to cultural and linguistic competence.
9. b. According to National CLAS Standards, clients with LEP should be offered language assistance in their preferred language in a timely manner and at no cost to them.
10. b. One way that health care facilities can be made more welcoming to LGBTQIA+ individuals to include nonbinary choices on all forms, allowing individuals to identify in their own way.

Chapter 25

Review Questions

1. c. Completing the Social Identity Wheel is a strategy to promote self-awareness and recognize the various facets of one's identity. By understanding how one's own identity influences viewpoints and actions, the nurse can become more culturally competent and address any unconscious biases that might impact client interactions.
2. c. Adapting care practices to align with the client's cultural preferences and needs demonstrates cultural humility. It recognizes the importance of valuing the client's cultural background and adjusting care to ensure

it is respectful and appropriate based on the client's cultural beliefs and practices.

3. c. Decolonization in nursing practice entails acknowledging and addressing the historical impact of colonial ideologies. It involves challenging privilege, embracing cultural humility, and promoting equitable care that respects diverse perspectives and backgrounds.
4. c. Acknowledging privilege is crucial to promoting fairness and advocating for change. Nurses should recognize their social privileges and actively work to address disparities and inequalities within the health care system. According to the ANA, nurses must acknowledge their social privileges and take responsibility to address unjust systems and structures.
5. b. Conscious impermeability refers to being aware of the importance of cultural humility but facing challenges in applying it in practice. The nurse recognizes power imbalances but may struggle to demonstrate cultural humility effectively.
6. c. In nursing, power imbalances can create conflicts and hinder effective communication between nurses and clients due to differing roles, knowledge, and authority. Power imbalances can lead to unequal treatment, where nurses may make decisions without considering client preferences. This compromises client autonomy and can result in decisions that may not align with the client's wishes or values.
7. d. The "E" in the mnemonic stands for encounters. This question prompts the nurse to reflect on their commitment to engaging in meaningful interactions and resolving conflicts with individuals from different cultures.
8. a. Mindful awareness involves actively listening to others and seeking to understand their perspectives without interruptions or judgments.
9. c. In-group favoritism refers to individuals' preference for members of their own social identity groups, leading to positive evaluations within the group.
10. c. Reflection and critical thinking about one's values, beliefs, and cultural heritage can help nurses understand how their background influences their perceptions, decisions, and interactions.

Chapter 26

Review Questions

1. c. Primary prevention for childbearing clients refers to activities aimed at preventing health problems before they occur, such as providing education about healthy nutrition and exercise.
2. b. Promoting self-care involves providing the client with the ability to take an active role in maintaining or improving their own health. Education allows the client to actively address their gestational diabetes.
3. a. To prevent SUID, the nurse teaches parents to place the baby on their back on a firm sleep surface that is free from pillows, blankets, or other soft bedding.
4. b. Effective family engagement involves actively involving the family in the planning and implementation of health promotion interventions. By collaborating with each family, the nurse can gain a deeper understanding of their cultural practices, values, and beliefs related to health. This understanding enables the nurse to tailor interventions that are respectful, culturally appropriate, and aligned with the family's preferences, leading to better engagement and improved health outcomes.
5. c. Drowning is one of the leading causes of death in children age 5 to 9 years.
6. b. Support from family is a relationship factor that can protect against suicide.
7. b. When comparing health outcomes between adult men and adult women in the United States, it is important to consider potential disparities. Cerebrovascular disease is a major disease in both genders, but adult women tend to have higher rates compared to adult men.
8. a. Prevention of the onset of disease occurs through primary prevention, such as vaccinating according to the recommended schedules.
9. c. A particular area of focus by Healthy People 2030 is reducing falls in older adults. One way the nurse can work to prevent falls in this population is by reducing use of inappropriate medication.
10. d. Elder abuse is an intentional act or failure to act that causes or creates a risk of harm to an older adult. Older adults with mental illness are at increased risk for elder abuse due to their diminished capacity to recognize and report mistreatment, understand their rights, or protect themselves from harm.

Chapter 27

Review Questions

1. c. Homelessness refers to individuals or families who lack a regular, fixed, and adequate nighttime residence. This includes those living in shelters or in public or private locations not designed for regular sleeping, such as in cars, parks, abandoned buildings, transportation stations, and campgrounds.
2. b. Advocating for affordable health care is the only upstream intervention and is a primary method to prevent individuals from becoming homeless by addressing contributing factors.
3. b. Agent Orange is a tactical herbicide that is associated with cancer.
4. a. Heteronormativity is a form of implicit bias. Discussing oral contraception with all women of childbearing age regardless of their sexual orientation is a classic example of heteronormativity. Other examples of implicit bias include referring to same-sex partners as “friends” or intentionally excluding same-sex partners from health conversations.
5. c. Secondary prevention measures include screening activities to identify and treat diseases as early as possible to prevent complications.
6. d. Many children are required to work alongside their parents to help increase the family’s income. These families often live in poverty and need the extra money to survive.
7. a. Individuals with disabilities face frequent barriers to care. Aspects of care that create barriers to providing optimal and equitable care are an inaccessible physical environment, a lack of assistive technology for communication, programmatic barriers of lack of time for medical examinations, negative attitudes toward individuals with disabilities, and social and transportation barriers. Allotting 15 minutes per client encounter is a barrier to providing comprehensive care to individuals who require modifications due to mobility, hearing, or vision difficulties.
8. c. The underlying theme of universal design is ensuring access for everyone. It refers to the design of spaces, communication modalities, environments, and products that are accessible and usable by all individuals including those with disability needs and chronic illness.
9. b. ACEs are traumatic events occurring in childhood that can have a lifelong negative impact on health. Traumatic events may include experiencing violence or neglect, witnessing violence in the home or community, or having a family member attempt or die by suicide. Additionally, growing up in an environment that undermines a sense of safety, stability, or bonding also contributes to ACEs.
10. c. Disadvantaged populations are groups of individuals with a higher risk for adverse health outcomes. Individuals experiencing homelessness, veterans, LGBTQIA+ populations, migrant workers, individuals with disabilities, and those who have experienced ACEs are all considered disadvantaged populations that increase their risk for significant health disparities.

Chapter 28

Review Questions

1. b. Nurses should not assume that an adult with a child is the child’s parent. The nurse should first confirm the type of relationship between Jackson and the adult.
2. c. Positive family interactions, intimacy, and a sense of belonging are social needs according to Maslow’s hierarchy.
3. a. According to general systems theory, the family is one whole system comprised of subsystems where family members are connected by emotional bonds. The parents’ divorce will alter their subsystem.
4. d. The most effective nursing interventions address all three functional domains: cognitive, behavioral, and affective. Incorporating reading labels into their shopping routine indicates the family understands what was taught (cognitive), changed their behavior when shopping (behavioral), and recognized its importance and incorporated it into their family’s routine (affective).
5. a. A primary level health promotion intervention involves implementing measures that prevent a disease or condition from occurring—in this case, falls.
6. b. Home health nurses can face unpredictable and unsafe conditions. They should remain vigilant of their surroundings and recognize potential safety concerns.
7. c. There are three different types of abuse: physical, sexual, and emotional. Emotional abuse harms a

- person's self-worth or emotional well-being.
8. d. Genograms show family connections and include health-related information such as health conditions.
 9. c. The abuser acting lovingly toward the client is consistent with the honeymoon phase of the IPV cycle.
 10. a. Taking the time to listen to the older adult client and the family is one of the first strategies that can be used to prevent abuse. Providing resources to families can alleviate burdens and reduce the risk of a crisis.

Chapter 29

Review Questions

1. a. Promoting a healthy school environment involves activities that emphasize healthy choices and behaviors, such as planning healthy school meals.
2. b. Advocating for fluoridation of drinking is an example of a community-level intervention as it affects everyone within the community.
3. c. A role of the nurse working in a local public health department includes educating the community on a variety of health topics to assist the community members in making healthy choices.
4. d. *Estelle v. Gamble* established the constitutional obligation to provide health care to any individual in the custody of the government, guaranteeing health care for individuals who were incarcerated.
5. b. There is a lack of privacy when caring for incarcerated individuals since corrections officers oversee all aspects of the health care delivery system within correctional centers. Balancing the conflicting roles of public safety and security by the corrections department and the professional nursing mission to promote the well-being of all clients is at the heart of corrections nursing.
6. d. Infectious diseases are a major concern in correctional facilities where the environmental conditions make the spread of infectious disease more likely. The CDC recommends primary prevention for hepatitis A in correctional setting by beginning the hepatitis A for all unvaccinated juveniles under the age of 18 and all adults who are at increased risk for hepatitis A infection such as men who have sex with men, those who use IV drugs, and individuals experiencing homelessness. The CDC also recommends beginning the hepatitis B vaccine series for juveniles and unvaccinated adults.
7. b. The Nurse Practice Act is the state's governing law that determines the scope of practice of nursing that school nurses must follow.
8. a. Secondary prevention activities include screening activities to identify disease before the onset of signs and symptoms, such as screening to identify early hearing loss to mitigate complications from a later diagnosis.
9. a. Ergonomic hazards increase strain and the risk for musculoskeletal injury and include repetitive motions, such as typing or working on an assembly line.
10. c. The most common long-term conditions in incarcerated individuals are hypertension, arthritis, asthma, and hepatitis. Tertiary health promotion reduces the severity of disease, such as providing low-sodium dietary options for those with hypertension.

Chapter 30

Review Questions

1. c. Transitional care refers to the provision of care to clients during transitions between different health care settings, ensuring continuity and safety. Medication reconciliation is an important intervention during transitional care to review and reconcile medication lists, address changes in medications, provide education, and promote adherence to prevent medication errors and adverse events during transitions.
2. c. Limited health literacy increases the risk for a poor transition of care outcome. When clients struggle to understand health care instructions, medication regimens, or follow-up care, it can lead to misunderstandings, nonadherence, and suboptimal outcomes.
3. b. Medication reconciliation is the process of comparing a client's medication orders to all the medications the client has been taking and ensuring that the client has access to necessary medications during transitions to prevent medication errors. Since it also involves checking that the client has a clear understanding of their medication regimen, the nurse should follow up with this client to make sure that the "blue pill" is a current order and that the client understands what it is for and how to take it.

4. c. Care transition models are designed to support seamless transitions between health care settings. They provide frameworks and guidelines to ensure coordinated and client-centered care during transitions, minimizing disruptions and improving outcomes.
5. b. The IDEAL Discharge Planning guide engages clients and their families in the discharge planning process. Involving clients and their support systems ensures that the discharge plan aligns with their preferences, needs, and capabilities, ultimately improving client satisfaction and outcomes.
6. d. The TCM emphasizes the use of advanced practice nurses (APRNs) to coordinate care, educate clients and caregivers, and facilitate communication among various health care providers. It is designed to ensure the health and safety of high-risk older clients. TCM emphasizes client and caregiver education, promoting self-management and improving communication among health care providers.
7. c. Community health nurses play a key role in coordinating care and advocating for clients across different health care settings. They ensure continuity of care, facilitate effective communication among health care providers, and support clients throughout their health care journey.
8. c. Research suggests that medication adherence is improved when clients are given their medications in the hospital at the time of discharge compared to needing to pick up prescriptions at a pharmacy.
9. a. Ensuring effective communication among health care providers is a strategy to improve safety and continuity of care for clients during the transition from behavioral health hospitalization to outpatient care. This helps prevent miscommunication, enhances coordination, and ensures a smooth transition for clients.
10. b. Mobile health applications can facilitate self-care by allowing clients to share data such as blood glucose levels with their health care providers to help manage their condition.

Chapter 31

Review Questions

1. b. This question best reflects a nonjudgmental approach to discussing a client's substance use.
2. a. In the 1990s, health care professionals' increased prescribing of prescription opioids marked the start of the opioid epidemic.
3. d. By assigning tasks and maintaining boundaries, the nurse is applying the principle of trustworthiness and transparency.
4. c. By introducing themselves and explaining their role in the session, the nurse is incorporating trauma-informed care into their practice.
5. d. Recent research indicates more than half of this age group experiences suicidal ideations or thoughts of self-harm.
6. a. Public stigma involves negative attitudes others have about mental illness.
7. d. Common types of labor trafficking include people forced to work as farmworkers, domestic servants, and factory workers.
8. b. The language people use, including by health care professionals (HCPs), can contribute to stigma and discrimination against people with SUDs.
9. c. Human traffickers will attempt to keep the victims isolated and try to control their actions.
10. c. Refugees' health status is influenced by conditions in their home countries, conditions during their travel, and conditions present in their camp.

Chapter 32

Unfolding Case Study

1. a. Older adults are more likely to have chronic conditions or mobility, sensory, cognitive, social, and economic limitations that can hinder their response to disaster and negatively affect their health (Humanitarian Global, 2021).
2. b. Educational classes on family safety planning and other educational interventions prior to hurricane season can assist families in preventing injury and minimizing the impact of the disaster.
3. c. The verification that the scene is safe prior to first responders providing care prevents secondary incidents and subsequent injuries (Alpert & Kohn, 2023).
4. b. The nurse working in a disaster shelter should expect to monitor physical and mental health of victims.

Stress is common for all victims of a disaster due to displacement from homes, loss of possessions, loss of employment, fear of the future, and living closely with strangers. Signs of stress include headache, nausea, worry, fatigue, insomnia, irritability, nervousness, fear, and racing thoughts.

Review Questions

1. b. Mitigation is an action that reduces the severity of a disaster, such as stacking sandbags along a river's edge to prevent flooding.
2. d. The START algorithm places this victim in the red category, in need of immediate care. The victim in the red category can be helped by immediate intervention and transport, requires medical attention within minutes for survival (up to 60 minutes), and has a compromised airway, breathing, or circulation. This client with tachypnea (rapid respiratory rate) and a flail chest has breathing difficulties that require immediate intervention.
3. d. During the Sort stage of the Sort, Assess, Life-saving Interventions, and Triage/treatment (SALT), the nurse asks the victims at the scene to walk to a designated casualty collection area if possible and wave an arm or leg if they need help. Those who cannot move or follow commands are assessed first.
4. c. During step 3, vulnerability assessment, the nurse determines the probability that the community will be negatively affected by a hazard. This includes an estimation of damages and the community's capacity to reverse or combat those damages.
5. b. A Category A biological agent is highly transmissible, easy to disperse, and associated with high mortality rates.
6. a. The Logistics Section Chief provides resources and services to support an incident, such as facilities, transportation, communications, supplies, equipment maintenance, food services for responders, and medical services for responders. Providing boats to rescue survivors from flooded waters would fall under the duties of the Logistics Section Chief.
7. d. JumpSTART is a modification to the START system to assess and triage pediatric victims up to 8 years old. This method considers the difference in normal respiratory rates for children up to 8 years old. Respirations of more than 15 and less than 45 breaths/minute are considered normal. Since this child's respiratory rate is 14 breaths/minute, it is abnormal, and the child should be given a red tag indicating they require immediate attention.
8. a. In primary prevention for bioterrorism preparedness and response, the community health nurse engages in disease surveillance and preparation. Creating, updating, and implementing a disaster plan and participating in tabletop exercises and disaster simulations are strategies the community health nurse can take to mitigate injury and mortality from biological attacks.
9. b. Warning signs of potential school violence include having behavioral problems or difficulty connecting with others, being noncommunicative, having aggressive or violent verbalizations, being withdrawn, harming self or others, and being emotionally labile.
10. c. Nursing assessment and intervention during the recovery stage include monitoring and screening for communicable and infectious diseases, educating on water and food safety, educating on clean-up and disposal of debris and deceased livestock/animals, eliminating safety risks, and screening and treatment for mental health issues.

Chapter 33

Unfolding Case Study

1. c. Tanesha may be developing a respiratory infection. However, managing her hypertension, blood sugar, and mental health should also be rapidly assessed. When working with communities, it is important to address their most pressing issues first. When there are many issues, it is important to identify and manage the most life-threatening conditions first.
2. d. Clients like Tanesha require medical care to regulate their immediate health concerns. They also need social services to help them obtain housing, food, mental health care, and Medicaid insurance to help them to meet their health care needs.
3. b. Tanesha has experienced domestic and intimate partner trauma, and the shelter may ignite fear related to a possible recurrence. Nutritional and sleep assessments are also important. She has not shown signs of

potential suicide risk.

4. d. Knowledge and access to health care could have prevented Tanesha's situation from devolving into homelessness.

Review Questions

1. b. Nurses can advocate for the profession by talking about their work and the scope of nursing practice so the public learns about the professional role of nursing. A good place for new nurses to begin this advocacy is by educating their clients and families about the nursing profession.
2. b. Research shows that during the COVID-19 pandemic a lack of adequate nurse staffing led to an increase in hospital mortality, length of stay, and readmissions.
3. a. When speaking with community partners about a need for change, the nurse should stay on point and succinctly communicate key information within the first minute of a conversation.
4. c. Global disparities in maternal and infant mortality are higher among BIPOC populations, with Black women five times more likely to die from pregnancy-related cardiomyopathy and eclampsia than White women.
5. a. A coalition is a group of people with shared vision or concerns who collaborate to support a cause. Nurses may form coalitions to maximize resources to improve the chances of successfully achieving these goals.
6. c. The National Academy of Medicine developed the Future of Nursing Report 2020–2030, which set goals for public health and emerging health policies. One of its goals is to attain high-quality, longer lives free of preventable disease, disability, injury, and premature death.
7. a. PACs form to generate and spend funds to elect political candidates that align with a particular agenda.
8. c. NOBC collaborates with other associations and health care and business partners to provide nursing leadership as members on the boards of directors for organizations. NOBC provides mentors to help nurses develop leadership skills and advance in organizations.
9. d. A coalition is a formal group with a defined leadership team, such as a chairperson, facilitator, individual members, staff, a steering committee, a lead agency, and member organizations.
10. b. The Campaign for Action coalition brings together nurses, providers, consumers, educators, and businesses at the state level to implement strategies that support the Future of Nursing report, such as increasing diversity in the nursing profession.

Chapter 34

Review Questions

1. c. The stage-sequential model of policy development is a process that uses five steps to create a policy: agenda setting, policy formulation, policy adoption, policy implementation, and policy evaluation. In the policy formulation stage, the nurse is involved in making a plan and setting goals and objectives to solve an identified problem.
2. d. Public policies are aimed at improving health through local, state, or national regulations.
3. b. The cycle of poverty is a series of events that occur between generations. The main idea is that once a person or family becomes impoverished, it is almost impossible to change their economic status, and an external intervention is needed to break the cycle. One characteristic of a family in the cycle of poverty is the low level of education among the family members.
4. b. In the workplace, the nurse can engage in political action by serving on a committee that promotes a healthy community through screenings.
5. a. Three generalized groups participate in the creation of health policies: private institutions (micro-level), state- and regional-level agencies and lawmakers (meso-level), and federal agencies and lawmakers (macro-level). At the meso-level, health care policies concern the county, state, or larger geographical region, such as developing vaccination clinics at the state level.
6. c. Key community partners have an interest or expertise in an area of policy, such as a zoning official who can help the nurse with zoning regulations in the development of a hiking trail.
7. a. An information brief provides a concise summary of the current research on a policy method, approach, or other related concerns.
8. a. The nurse determines a policy's effectiveness during the policy evaluation stage of the stage-sequential model of policy development.

9. a. The CDC's HiAP is a collaboration across all sectors to integrate and articulate health considerations into policymaking to improve the health of all communities.
10. c. Nurses can influence local, state, and national social justice policies. At the state level, the nurse can influence social justice policies by educating members of Congress about the health needs of transgender individuals.

Chapter 35

Review Questions

1. c. Naloxone is specifically used to rapidly reverse the effects of an opioid overdose. It works by binding to opioid receptors in the brain, displacing other opioids and restoring normal breathing in individuals experiencing an overdose. This knowledge is crucial for community nurses involved in overdose response.
2. c. Primary prevention involves interventions that promote health and prevent the onset of diseases. Focusing on early childhood nutrition, education, and development is a primary prevention strategy aimed at establishing a strong foundation for lifelong health. This approach addresses health promotion and disease prevention from the early stages of life.
3. a. The nurse advocating for policies that improve air quality, promote physical activity, and encourage healthy eating is focusing on primary prevention. Primary prevention aims to prevent the onset of diseases by addressing risk factors and promoting healthy behaviors in the community.
4. b. Using assessment data to identify clients at risk for health problems so interventions may be implemented is an example of a secondary prevention strategy.
5. b. Working with the transit system to add bus routes to serve a disadvantaged population is an example of client advocacy.
6. a. Nurses must respect their clients' values and uphold technology's ethical and safe use. To achieve this, the nurse should educate clients about the benefits, risks, and potential implications of using specific technologies in their care. This empowers clients to make informed decisions based on their values and preferences.
7. d. The nurse working with community leaders as well as the transportation board to add sidewalks and bike paths to encourage physical activity is an example of a Health in All Policies approach
8. d. The shortage of health care providers hinders health equity and client access to care. Allowing advanced practice nurses full authority to practice expands the capacity of the health care workforce to treat clients.
9. b. Opioid use disorder often co-occurs with mental health disorders, making assessment and treatment complex.
10. c. Young people are drawn to tobacco products through peer pressure, social influences, and aggressive advertising. Launching a social media campaign that discourages smoking can use this social influence to promote positive health behaviors.
